Figure S.1: Physicochemical properties of IONPs. Fluorescent dimercaptosuccinate (DMSA)-coated IONPs were dispersed in water (a,c,e) or glia-conditioned medium (GCM) (b,d,f) at a concentration of 1 mM (a-f) or 3 mM (e,f) and analyzed by transmission electron microscopy (a,b), energy dispersive X-ray spectroscopy (c,d) and dynamic light scattering (e,f). The scale bar in panel b represents 5 nm and applied to panels a and b.
Figure S.2: Consequences of a 24 h exposure of cultured astrocytes and neurons to IONPs. Neurons (a,b) and astrocytes (c,d) were incubated for 24 h with up to 3 mM iron as IONPs in glia-conditioned medium. Cell viability was assessed by measuring cellular LDH activity (a,c) and MTT reduction capacity (b,d). The data present means ± SD from values obtained on three independently prepared astrocyte or neuron cultures. Asterisks indicate significant differences compared to control cells that had been incubated in the absence of IONPs (**p<0.01, ***p<0.001).
Figure S.3: Localization of IONPs in astrocytes and neurons after 24 h exposure to IONPs. Cultured astrocytes (a-d) or neurons (e-h) were incubated for 24 h with 0.3 mM BP-DMSA-IONPs in glia-conditioned medium followed by a 90 min incubation with 100 nM lysotracker. Cells were washed with PBS and fixed with 3.5% (w/v) paraformaldehyde prior to microscopy. Co-localization of IONPs and lysotracker is indicated by yellow color (c,g) and by arrows (a-c, e-g). The scale bar in panel h represents 25 µm and applies to all panels.
Figure S.4: Staining for reactive oxygen species (ROS) in cultured astrocytes and neurons after 24 h exposure to IONP. Cultured astrocytes (a-j) or neurons (k-t) were incubated for 24 h with the indicated concentrations of iron as IONPs in glia-conditioned medium. Subsequently, the cells were incubated for 15 min with dihydrorhodamine 123 to test for ROS generation and with H33342 to stain all nuclei. As positive control for ROS production, cells were incubated for 23 h 45 min with 100 μM ferric ammonium citrate, followed by an incubation for 15 min with 1 mM H$_2$O$_2$ in HEPES-buffered incubation buffer (20 mM HEPES, 5 mM glucose, 1.8 mM CaCl$_2$, 1 mM MgCl$_2$, 5.4 mM KCl, 145 mM NaCl, pH 7.4). The scale bar in t represents 100 μm and applies to all panels.
Table S.1. Raw data determined for the average hydrodynamic diameter, the polydispersity index and the zeta-potential of BP-DMSA-IONPs dispersed in concentrations of 1 mM or 3 mM in water or glia-conditioned medium.
