INTRODUCTION

Diabetes Mellitus is rendered as a syndrome with heterogeneous group of diseases characterized by impaired glucose regulation as a consequence of chronic hyperglycemia [1]. There are three common types of diabetes mellitus; Type 1 is Insulin Dependent DM, Type 2 is Non-insulin Dependent Diabetes mellitus (DM) and Type 3 is gestational diabetes, which occurs sometimes in pregnancy: Dramatic increase in diabetes mellitus has adversely affected the health quality throughout the world [2]. International Diabetes Federation indicated that about 415 million people suffered from Diabetes Mellitus in 2015, which will rise to 642 million till 2040. In Pakistan, 1 in 11 adults are diabetic and 86,364 adults died due to diabetes [3].

Diabetes mellitus stays multifaceted long-lasting ailment allied with state of extraordinary blood glucose level, or else hyperglycemia, occurring from insufficiencies in insulin secretion, action otherwise both continuing metabolic inequity connected through this illness puts patients a high risk for long stretch macro also micro vascular difficulties, which if not on condition that with great quality maintenance, lead towards regular hospitalization besides impediment, counting raised risk intended for CVDs; cardiovascular diseases [4]. The most common complications in diabetic patients are stroke, hypertension, nephropathy, amputation, neuropathy, cardiovascular, retinopathy, impotency and skin lesions etc. Retinopathy leads to blindness in diabetic patients in adults [5]. Longer diabetes duration and poorer glycemic and blood pressure control are strongly associated with Diabetic Retinopathy [6].

A prospective study indicated that apart from glycemic control the incidence of neuropathy is associated with potentially modifiable cardiovascular risk factors including a raised triglyceride level, body mass index, smoking and hypertension. Diabetes mellitus stays communal subordinate reason of hyperlipidaemia, predominantly, uncertainty glycaemic mechanism stays deprived, which in-turn remains significant menace influence intended atherosclerosis as well as coronary heart ailment [7].

Type 2 Diabetes Mellitus stays frequently connected with collection of numerous supplemental risk influences of cardiovascular diseases (CVD) for instance older age, insulin opposition, fatness, hyper tension, deprived glycemic prestige,
variations in demagogic, clotting besides thrombolytic markers in addition towards dyslipidemia [8]. Bunching of numerous of these risk influences often manifests as metabolic set of symptoms that come first besides then remains by way of diabetes [9]. Diabetes stays sound-recognized sovereign risk issue intended for cardiovascular diseases (CVD). Associated by means of non-diabetic individuals, diabetic patients have 2 to 4 times greater than before risk intended for stroke as well as death from heart ailment [10]. Various co-variate risk influences of cardiovascular diseases (CVD) like smoking, physical inactivates, poor glycemic control, obesity as well as hypertension suggestive of high risk of forthcoming CVD. Therefore, it is need of time, to give awareness about diabetes and the complications related to it, so people can improve their life styles.

METHODOLOGY

The research was carried out in different sex groups, different age groups of different ethnic groups living in Quetta Balochistan, by collecting their blood samples with a questionnaire. Equal samples of males and females were collected randomly for this purpose from different age groups. The demographic and behavioral risk factors were collected through face to face interviews, using an interview administered questionnaire. Each participant was questioned for age, sex, education, occupation, income, physical activity, alcohol consumption and smoking, cast, medication, type of diabetes and co morbidity. Complications by chronic diabetes mellitus like eye diseases, heart diseases, kidney dis-function, neuropathy and muscular dystrophy were also inquired in the questionnaire.

Fasting blood glucose measurements were taken after an overnight fasting (>8h). These measurements were performed for all the participants using standard methods for glucose analysis and the results were recorded.

In order to calculate the body mass index (BMI) height and weight of different groups of patients were measured. Both weight, i-e, machines digital and analogue were used for the purpose. BMI was calculated by a formula weight in kilograms divided by height in meters square.

Data Analysis

The data was analyzed statistically by using computer package SPSS version 20. Frequency and percentages were computed to present all the categorical variables by mean and standard deviations. Analysis of Variance test will be performed by SPSS 20.

RESULTS

The blood glucose of all the diabetic patients was determined and categorized as shown in Figure 1.

Table 1 shows the prevalence and frequency percentage of complications related to chronic diabetes mellitus typeII in diabetic patients of quetta city. 52% diabetic patients were suffering from different types of pathological conditions conditions presented in Table 1.

The frequency percentage of data explore 30% occurance of cardiovascular conditions followed by 17.8% Neuropathy, 14.8% Ocular conditions, 10.7% Renal conditions, 6.8% Cerebrovascular conditions 0.8% Foot diseases,0.7% Foot ulcer and 0.1% Amputation. Among Cardiovascular conditions the frequency distribution of Angina was 10.6%, Hypertension 8.5%, chronic heart failure 3%, heart diseases 1%, infarction 0.7% and peripheral vascular diseases 0.4%.

In Nephropathic conditions the most frequent condition was Microalbuminuria 7%, which was followed by renal failure 1.9%, Macroalbuminuria 0.8% and Renal hypofunction 0.3%. The frequency percentage of Ocular conditions involve Cataract 8.6%, Retinopathy 4.8% and Blindness 0.1%.

In cerebrovascular conditions the frequency distribution of Transient ischemic disease (TIA) 3.6%, was found greater than...
Stroke 2.4%. Whereas the occurrence of both stroke and TIA was 0.8%.

| Categories by organ & system                      | No. of cases | %    |
|--------------------------------------------------|--------------|------|
| Cardiovascular conditions                        | 459          | 30.1 |
| 1. Cardio-condition                              | 381          | 25.0 |
| Angina                                           | 161          | 10.6 |
| Hypertension                                    | 130          | 8.5  |
| Chronic heart failure                            | 45           | 3.0  |
| Heart disease                                    | 16           | 1.0  |
| Infarction                                       | 12           | 0.8  |
| Percutaneous transluminal coronary angioplasty   | 11           | 0.7  |
| Peripheral vascular disease                      | 6            | 0.4  |
| 2. Cardio-conditions concurrently                | 70           | 4.6  |
| Angina + other cardio-conditions                 | 47           | 3.1  |
| Other 2 cardio-conditions concurrently           | 23           | 1.5  |
| 3. Cardio-conditions concurrently                | 8            | 0.5  |
| Angina + other cardio-conditions                 | 8            | 0.5  |
| Cerebrovascular conditions                       | 103          | 6.8  |
| 1. Cerebro-condition                             | 91           | 6.0  |
| Stroke                                           | 37           | 2.4  |
| Transient ischemic attack (TIA)                  | 54           | 3.6  |
| Both stroke and TIA                              | 12           | 0.8  |
| Neuropathy                                       | 271          | 17.8 |
| Nephropathy conditions                           | 162          | 10.7 |
| 1. Nephro-condition                              | 152          | 10.0 |
| Microalbuminuria                                 | 107          | 7.0  |
| Macroalbuminuria                                 | 12           | 0.8  |
| Renal hypofusion                                 | 4            | 0.3  |
| Renal failure                                    | 29           | 1.9  |
| 2. Nephro-conditions concurrently                | 10           | 0.7  |
| Microalbuminuria + other nephrocondition         | 10           | 0.7  |
| Ocular conditions                                | 225          | 14.8 |
| 1. Ocular condition                              | 205          | 13.5 |
| Cataract                                         | 131          | 8.6  |
| Retinopathy                                      | 73           | 4.8  |
| Blindness                                        | 1            | 0.1  |
| 2. Ocular conditions concurrently                | 20           | 1.3  |
| Cataract + Retinopathy                           | 19           | 1.2  |
| Retinopathy + Blindness                          | 1            | 0.1  |
| Foot diseases                                    | 12           | 0.8  |
| Foot ulcer                                       | 10           | 0.7  |
| Amputation(AMP)                                  | 2            | 0.1  |
| Single category                                  | 465          | 30.5 |
| 2 category concurrently                          | 234          | 15.4 |
| 3 category concurrently                          | 74           | 4.9  |
| 4 plus category concurrently                     | 19           | 1.3  |
| Total                                           | 792          | 52.0 |

DISCUSSION

There are many physiological causes of complications related to diabetes like high blood pressure, smoking, elevated cholesterol levels, obesity and lack of regular exercise which can be controlled by a healthy life style. Overall, complications become less common and severe in diabetic patients with controlled blood glucose levels [11]. Hyperglycemia, coma, macrovascular disease, microangiopathy and immune dysfunction are common complications related to diabetes mellitus. Microangiopathy can affect all vital organs like heart, kidneys and brain, as well as eyes, nerves, lungs, and locally gums and feet. Similar results were found in current study, about 52% of diabetic patients were having such comorbidities involving their vital organs like heart, kidneys, brain, feet and eyes.

International Diabetes Federation has estimated that numeral societies by way of diabetes global in 2015 stayed 415 million besides this remains estimated towards range 642 million in 2040. In 2015 diabetes stayed principal root of mortality, whereby 5 million individuals expired from diabetes also diabetes-related difficulties. Long-term macrovascular technical hitches of diabetes subsidize towards extraordinary morbidity also mortality allied with ailment with as many as 80 % dying from some form of cardiovascular disease. In 2017, approximately (7.5 (5.3-10.9) million) Pakistanis had leading numeral adults aged 20-79 years with diabetes [3].

Cardio Vascular Diseases (CVD) stays main reason of expiry also disability in societies through diabetes. In young publics by means of type 1 diabetes (8-43 years), able to five people out of 1,000 expire since CVD each year, whereas between middle-matured publics by type 2 diabetes existing great as well as intermediate revenue populations, fit for 27 entities out of 1,000 expire since CVD each year; a third of them expire as of stroke, in addition to quarter expire as of coronary artery disease [13].

In the present study it was observed that among all other comorbidities, the cardiovascular diseases were found highest in frequency 30.1%, which shows the prevalence of CVDs amongst all other comorbidities and its adverse effect on health of diabetic patients.

The prevalence of neuropathy was found at 2nd number, which was followed by Ocular conditions. Nephropathy was found at 4th number in comorbidities found in diabetic patients of Quetta city. If diabetic patients improve their eating and excersice habits they can control their sugar levels and can be at lower risk of these comorbidities.

As said by ADA as well as WHO Standard [12] in female also male patients of revision (28.4%) besides (27.9%) of patient standards intended for FPG stayed required, (71.6%) and (72.1%) of patient’s high value for FPG. In female also male patients (25.3%) and (28.6%) of patient standards intended for RPG stayed required, (74.7%) and (71.4%) of patient’s great rate intended for RPG. As stated by Recommendation of (30.5%) and (36.7%) of patient standards for HbA1c stayed desirable, (69.5%) and (63.3%) of patient’s high value intended for HbA1c [12]. Similar results were obtained in the current study for male and female diabetic patients.

The present study can create awareness of complication of diabetes in public of Quetta. Diabetic patients should reduce smoking control hyperglycemia, obesity and hypertension. They should increase physical activates and take care of their diet in order to get rid of these complications related to diabetes.

Conclusion

This study on the complications by chronic diabetes mellitus type II in diabetic patientst of Quetta Balochistan has reaveled the prevelance of comorbidities in this order cardiovascular conditions > neuropathy conditions > Ocular conditions > Nephropathy conditions > Cerebrovascular > Feet conditions > Amputations.
