INTRODUCTION

The purpose of any drug delivery system is to provide a therapeutic amount of the drug to the proper site of action in the body to maintain the desired drug concentration. Oral route is most convenient route of administration dosage form. Tablet is a convenient dosage form acceptable by patients and physicians. Bilayer tablet is suitable for sequential release of two drugs in which one is immediate release and another is sustained release [1]. The fixed-dose Combinations of two or more active drugs produced in a single dosage form. The advantages of combination therapy to reduce the number of the dosage form in prescription and maintain administrative cost as well as improving patient compliance. The present study is about to find out the solution to reduce the incidence of diclofenac sodium-induced GI injury and other severe GI problems. This problem is overcome by preparing the bilayer tablet of diclofenac sodium with Aloe vera gel powder. Diclofenac sodium is a non-steroidal anti-inflammatory drug which has analgesic and antipyretic activity. Diclofenac is used to treat pain, menstrual pain, dysmenorrhea, ocular inflammation, osteoarthritis, rheumatoid arthritis and ankylosing spondylitis. The primary mechanism responsible for its analgesic, anti-inflammatory and antipyretic action is inhibition of prostaglandin synthesis by inhibition of cyclooxygenase and it appears to inhibit DNA synthesis. Inhibition of COX also decreases prostaglandins in the epithelium of the stomach, making it more sensitive to corrosion by gastric acid, which is responsible for the cause of ulcer [2]. Diclofenac is absorbed 100% orally, 99% protein bound, metabolized and excreted both in urine and bile. The elimination half-life is 1.2 to 2 h hence, diclofenac is suitable for sustained release layer [3]. Aloe Vera Gel Powder is the natural anti-ulcer medicine. Which Acts by directly interact with the H+ repressor on parietal cells which is responsible for decreases gastric acid secretion by direct interaction with acid. It is a poorly soluble drug with a short biological half-life of 4 hr and its absorption from the gastrointestinal tract (GIT) is rate limited [4] hence aloe vera gel powder for immediate release. Present study is to prepared bilayer tablets of Diclofenac Sodium (SR) by using HPMC as controlled release polymer in sustained release layer along with other excipients and aloe vera gel powder [IR] using SSG super disintegrants in an immediate release [5]. Both layers are compressed by direct compression methods. To evaluate blends in terms of Angle of Repose, Bulk and tapped density, Carr's index, Hausner's ratio and to evaluate Bi-layer matrix tablets in terms of hardness, weight variation, friability, thickness, drug content uniformity. In vitro dissolution studies in 1.2 and 6.8 pH [6].

MATERIALS AND METHODS

Material

Sample was procuring from Diclofenac sodium (), HPMC K4M, Talc (Thermosil fine chem.) Aloe vera gel powder (maple biotech prf ltd bhosari, Pune) starch, sodium starch glycolate, (research lab) Lactose, (Sahyadri scientific supply) Magnesium Stearate (Hilab chemicals) were sample is analytical grade.

Method

Formulation of bilayer tablet was prepared by direct compression method. Immediate release layer was prepared by using different super disintegrants (sodium starch glycolate).

Drug and above super disintegrants were passed through the 40# sieve and transfer into polybag and mix up to 3 min. Then add other excipients to the above mixture. Finally, add (glidant) talc into the blend.

Another layer was also prepared by direct compression; drug and polymer (HPMC k4M) were pass through the 40# sieve into polybag and mixed properly up to 3 min. Other excipients were mixed well and finally added Magnesium Stearate in the above blend and were mixed for 2 min.

Finally above optimized batch blends were compressed by rotary tablet compression machine (Make-CREATE INDUSTRIES, MODEL-LP-80MP).

Preformulation study: [7, 8]

Identification test by U. V vis. spectrophotometer

A. For diclofenac sodium:
25 mg of diclofenac sodium was weighed accurately and transferred it to 25 ml volumetric flask. Dissolved it in ethan ol and make the volume up to 25 ml with respective solvent. This was considered a stock solution (1000 mcg/ml). Further dilutions were made with this stock solution and scanned in the range of 400-200 nm using respective blank in UV spectrophotometer (SHIMADZU U.V 1800).

B. For Aloe vera gel powder
25 mg Aloe vera gel powder was weighed accurately and transferred it to 25 ml volumetric flask. Diss olved it in methanol and make the volume up to 25 ml with respective solvent. This was considered a stock solut ion (1000 mcg/ml). Further dilutions were made with this stock solution and scanned in the range of 400-200 nm using respective blank in UV spectrophotometer.

Melting point determination [8]
Melting point of diclofenac sodium and aloe vera gel powder was determined by using melting point apparatus by capillary method.

Determination of solubility [8]

Qualitative Solubility
Qualitative solubility analysis of drugs was done by dissolving 5 mg of drug in 5 ml solvent such as distilled water, methanol, ethanol, chloroform, phosphate buffer (7.4), ether.

Compatibility study, by FT-IR spectroscopy [7]
The powdered substance of the tablet was mix, dried potassium bromide (IR grade) ratio of sample is should be 1:100 mg, i.e 1 mg sample: 100 mg KBr, are compressed to form transparent pellets. The sample was scanned from 4000 to 400 cm^-1 at ambient temperature. (Perkin Elmer Spectrum-65)

Pre-compression evaluation [7]

Bulk density
Bulk density was determined by introducing the power blend into measuring cylinder and the total volume was measured and also total powder weight was measured. The bulk density was calculated by using formula.

Bulk density (BD) = weight of powder/bulk volume.

Tapped density
Tapped density was determined by tapping the cylinder by using the tapped density apparatus. Tapped the cylinder up to 100 times and then measure the tapped volume and calculate the tapped density by using formula.

Tapped Density (TD) = weight of powder/tapped volume.

Hausner’s ratio
Hausner’s ratio bulk density as to tapped density is the number that is correlated to the flowability of a powder or powder blend. It is calculated using formula,

Hausner’s ratio = tapped density/bulk density.

Compressibility index
Compressibility index was calculated by formula,

Carr’s index (%) = Tapped density–bulk density/tapped density* 100

Angle of repose
The angle of repose of powder blend of each layer of each formulation was determined by fix funnel method. The blend was poured through funnel separately until apex of pile so formed just touch the tip of the funnel. The angle of repose was calculated by using formula

θ = tan^-1 h/r

h is height of pile; r is the radius of pile.

Post-compression evaluation [6]

Uniformity weight
Uniformity weight of the tablet was determined by selecting 20tablet randomly. This selected tablet weighing individually and the weight of individual tablet was compared with average weight.

Thickness
Thickness of the tablet was measured by using vernier calliper. 5 tablets were selected and thickness was measured in (mm).

Table 3: Limits for tablet weight variation test

| Average weight of tablet (mg) | % Difference allowed |
|-------------------------------|---------------------|
| 130 or less                   | 10 %                |
| From 130 to 324               | 7.5 %               |
| > 324                         | 5 %                 |
Hardness

Hardness is an important parameter of evaluation of tablet. The resistance of the tablet to break under the condition of handling, transportation and storage depend upon hardness. The hardness of the tablet was measured by using Monsanto hardness tester. The unit of hardness is expressed in term of kg/cm².

Friability

Friction and shock are the forces that most often cause tablets to chip, cap or break. 10 tablets are weighed and placed in the (roche friabilator) apparatus they are exposed to rolling and repeated shocks as they fall 6 inches in each turn within the apparatus. After four minutes of this treatment or 100 revolutions, the tablets are weighed and the weight compared with the initial weight. The loss due to abrasion is a measure of the tablet friability. A maximum weight loss of not more than 1% of the weight of the tablets being tested during the friability test is considered generally acceptable and any broken or smashed tablets are not picked. The percentage friability was determined by the formula:

\[
\text{% friability} = \left( \frac{\text{initial weight} - \text{final weight}}{\text{initial weight}} \right) \times 100
\]

Content uniformity

For diclofenac sodium

10 tablets were taken and crushed into mortar to form a powder. From that, sample equivalent to 50 mg of drug was taken and transferred to 100 ml volumetric flask. Ethanol (20 ml) was added dissolve the drug and volume were made up to mark with methanol, this was filtered. From the filtrate 1 ml was taken and diluted with pH 6.8 phosphate buffer and absorbance of this solution was measured by using U. V-spectrophotometer at 275 nm (SHIMADZU; U. V1800).

For aloe vera gel powder

10 tablets were taken and crushed into mortar to form a powder. From that, sample equivalent to 100 mg of drug was taken and transferred to 100 ml volumetric flask. Methanol (20 ml) was added dissolve the drug and volume were made up to mark with methanol, this was filtered. From the filtrate 1 ml was taken and diluted with pH 6.8 phosphate buffer and absorbance of this solution was measured by using U. V-spectrophotometer at 262 nm (SHIMADZU; U. V1800).

In vitro drug dissolution studies

In vitro drug release was studied for immediate release tablet (Aloe vera gel powder)

In vitro drug release was studied using USP II (paddle) apparatus, (Electrolab TDT-08L) with 900 ml of dissolution medium maintained at 37±1 °C for 15 h, at 50 rpm. 0.1 N HCl (pH 1.2). 5 ml of sample was withdrawn in 10 min time intervals. The volume withdrawn at each interval was replaced with same quantity of fresh dissolution medium. Collected samples were analyzed by U. V spectrophotometrically at 262 nm, and cumulative percent drug release was calculated.

In vitro drug release was studied for sustained release tablet (Diclofenac sodium)

The In vitro dissolution study for the Diclofenac sodium sustained release tablets were carried out in USP type-II dissolution test apparatus (Electrolab TDT-08L) (Paddle type) using 900 ml of phosphate buffer pH 6.8 at 50 rpm and temperature 37±0.5 °C. At predetermined time intervals, 5 ml of the samples were withdrawn by means of a syringe fitted with a pre-filter, the volume withdrawn at each interval was replaced with same quantity of fresh dissolution medium. The resultant samples were analyzed by measuring the absorbance at 275 nm using UV Visible spectrophotometer and calculate the percentage drug release.

In vitro drug release was studied for bilayer tablet

The release of bilayer tablets was determined using USP Type II (Paddle) dissolution apparatus (Electrolab TDT-08L) under sink condition. The dissolution medium was 900 ml of a 0.1N HCl solution (pH=1.2), at 370c±0.2c for 1hour. Then dissolution media replace by phosphate buffer (6.8pH). The stirring speed was 50 rpm. Aliquot of the solution was collected at the specific interval were replaced with fresh dissolution medium. The Aloe vera gel powder and Diclofenac sodium were analyzed spectrophotometrically at 262 nm and 275 nm respectively using simultaneous equation method.

RESULTS AND DISCUSSION

Pre-formulation studies

The UV absorption of 10 μg/ml in methanol for Aloe vera gel powder is 262 nm in the range of 200-400 nm exhibit maximum and in case of Diclofenac sodium at 275 nm.

Melting point, solubility and compatibility study of both drugs are carried out and the result is including in table 4.
Fig. 2: Absorbance maxima of diclofenac sodium

dissolution test, thickness, hardness uniformity of dosage units and

The prepared tablets were evaluated for weight variation, thickness, hardness uniformity of dosage units and friability. The weight variation test is done by weighing 20 tablets individually, calculating the average weight and comparing the individual weights to the average.

Pre-compression evaluation

The micromeritic properties such as of bulk density, tapped density, Angle of repose, compressibility index, and Hausner's of Aloe vera gel powder immediate release layer blend and Diclofenac sodium sustained release layer were studied. The overall results were shown in table No5. The value of bulk density indicates good packing characteristics. The compressibility index of the formulation indicating poor flow properties of powder which were further confirmed by determining the angle of repose, it is in the range of 16 ° to 26 ° which indicates good flow properties.

The hardness of each batch of the tablet was checked by using Monsanto hardness tester. The hardness was measured in terms of kg/cm². The hardness of 6 tablets was determined using

The Friability was determined by first weighing 10 tablets after dusting and placing them in a friability tester (Roche friabilator), which was rotated for 4 min at 25 rpm. After dusting, the total remaining mass of tablet was recorded and the percent friability was calculated.

The thickness of each 10 tablets was measured with a Varnier Caliper. All test values are included. Drug content uniformity and In vitro drug release determined according to the USP requirements. Test values are including in Table 9.

Fig. 11: Drug release kinetic of sustained release layer (diclofenac sodium)

Kinetic models
Dissolution data of above bi-layered tablet was fitted in Zero order, First order and Higuchi equations. The mechanism of drug release was determined by using Higuchi equation.

CONCLUSION
The prepared tablets showed satisfactory results for various evaluation tests such as tablet dimension, hardness, friability, weight uniformity, drug content and in vitro dissolution study. The optimized formulation based on all the parameter A1 (Sodium starch glycolate) is selected for the immediate release layer and D3 (HPMC K4M) was selected for the controlled release layer. The drug release mechanism was found to be zero order release; dependent on both drug diffusion and polymer relaxation. The bilayer tablets of Aloe vera gel powder and Diclofenac sodium useful for NSAID with antiulcer Aloe vera gel powder.

ACKNOWLEDGMENT
Authors are thankful to Vishal Institute Pharmaceutical Education and Research, Ale for providing the raw materials to carry out this research work successfully.
