Measurement of inclusive W and Z boson production cross sections in pp collisions at $\sqrt{s} = 8$ TeV

The CMS Collaboration

Abstract

A measurement of total and fiducial inclusive W and Z boson production cross sections in pp collisions at $\sqrt{s} = 8$ TeV is presented. Electron and muon final states are analyzed in a data sample collected with the CMS detector corresponding to an integrated luminosity of $18.2 \pm 0.5 \text{ pb}^{-1}$. The measured total inclusive cross sections times branching fractions are

\[
\sigma(pp \to WX) \times B(W \to \ell \nu) = 12.21 \pm 0.03 \text{ (stat.)} \pm 0.24 \text{ (syst.)} \pm 0.32 \text{ (lum.)} \text{ nb}
\]

and

\[
\sigma(pp \to ZX) \times B(Z \to \ell^+ \ell^-) = 1.15 \pm 0.01 \text{ (stat.)} \pm 0.02 \text{ (syst.)} \pm 0.03 \text{ (lum.)} \text{ nb}
\]

for the dilepton mass in the range of 60 to 120 GeV. The measured values agree with next-to-next-to-leading-order QCD cross section calculations. Ratios of cross sections are reported with a precision of 2%. This is the first measurement of inclusive W and Z boson production in proton-proton collisions at $\sqrt{s} = 8$ TeV.

\url{doi:10.1103/PhysRevLett.112.191802}
The production of W and Z bosons is one of the most prominent examples of hard scattering processes at hadron colliders [1]. Theoretical predictions are available at next-to-next-to-leading order (NNLO) [2–6] in perturbative quantum chromodynamics (QCD). The calculations are limited by uncertainties in parton distribution functions (PDFs), missing higher-order QCD effects, and electroweak (EW) radiative corrections, which are available at next-to-leading order (NLO) [7–10]. Precise measurements of inclusive cross sections provide tests of perturbative QCD and validate the theoretical predictions of higher-order corrections. Additionally, accurate measurements can be used to constrain PDFs.

Inclusive W and Z boson production cross sections and their ratios were previously measured by the ATLAS and CMS Collaborations at the Large Hadron Collider (LHC) in proton-proton collisions at $\sqrt{s} = 7$ TeV [11–13]. This Letter describes the inclusive measurement at $\sqrt{s} = 8$ TeV, performed in the electron and muon decay channels, with the CMS detector. A data sample collected in 2012 corresponding to an integrated luminosity of $18.2 \pm 0.5$ pb$^{-1}$ is used.

The levels of instantaneous luminosity reached by the LHC in 2012 present challenges for the precise measurement of the W boson cross section because of the degraded missing transverse momentum resolution resulting from the large number of pp interactions per bunch crossing (pileup). A data sample with low pileup was collected in May 2012 by adjusting the beam separation during data taking. An average of 4 interactions per bunch crossing was achieved, compared with the average of 21 during the rest of 2012. The measurements of the W and Z boson production cross sections are performed using this data sample.

The central feature of the CMS apparatus is a superconducting solenoid, of 6 m internal diameter, providing a field of 3.8 T. Within the field volume are a silicon pixel and strip tracker, a crystal electromagnetic calorimeter (ECAL), and a brass/scintillator hadron calorimeter. Muons are measured in gas-ionization detectors embedded in the steel flux-return yoke of the magnet. CMS uses a right-handed coordinate system, with the origin at the nominal interaction point, the x axis pointing to the center of the LHC, the y axis pointing upwards, perpendicular to the plane of the LHC ring, and the z axis along the counterclockwise-beam direction. The polar angle $\theta$ is measured from the positive z axis, and the azimuthal angle $\phi$ is measured in the x-y plane. The pseudorapidity $\eta$ is defined by $\eta = -\ln[\tan(\theta/2)]$. Details of the CMS detector and its performance can be found elsewhere [14].

Leptonic W boson decays are characterized by a prompt, energetic, and isolated charged lepton and a neutrino giving rise to significant missing transverse energy, $E_T^{\text{miss}}$. Events used in the cross section measurement are not required to have a minimum reconstructed $E_T^{\text{miss}}$, but the $E_T^{\text{miss}}$ distribution is used as a discriminant against background from multijet events. Z boson decays to leptons are selected by requiring two energetic and isolated leptons of the same flavor and opposite charge. The Z boson candidates are required to have a reconstructed dilepton mass between 60 and 120 GeV. Samples of Z boson candidates satisfying looser lepton requirements are used to estimate efficiencies.

Because of the high rate of collisions and the limited bandwidth for data processing, the data acquisition system must be selective in deciding which events are sufficiently interesting to be kept for analysis. Triggers make rapid decisions by executing simplified muon and electron reconstruction algorithms. For this analysis, the events are collected when triggered by the presence of a muon with large transverse momentum, $p_T > 15$ GeV, and $|\eta| < 2.1$, or an electron with large transverse energy, $E_T > 22$ GeV, and $|\eta| < 2.5$, with loose isolation and identification requirements.

Electrons are identified as clusters of energy deposits in the ECAL matched to tracks measured
with the silicon tracker \[15\text{–}19\]. The ECAL fiducial region is defined by \(|\eta| < 1.44\) (barrel) or \(1.57 < |\eta| < 2.5\) (endcap), where \(\eta\) is the pseudorapidity of the energy cluster. The barrel-endcap transition region and the first ring of endcap trigger towers are excluded because they are partially obscured by cables and services exiting between the barrel and endcaps. A cluster is considered to be within the acceptance of the ECAL if it is within the ECAL fiducial region and has transverse energy \(E_T > 25\text{ GeV}\). Electrons are required to be isolated from other reconstructed particles in a cone of \(\Delta R = 0.3\), where \(\Delta R = \sqrt{\Delta \eta^2 + \Delta \phi^2}\). Particle candidates are identified using a particle-flow algorithm \[20\text{,}21\] that provides a complete description of the event in terms of electrons, muons, photons, charged hadrons, and neutral hadrons. An electron candidate is selected if the sum of transverse momenta of particles in the cone is less than 15% of the candidate’s transverse energy.

Muons are reconstructed from seed tracks in the muon detector combined with silicon strip and pixel information using a global fit \[22\text{,}23\]. In the \(p_T\) range of interest, the momentum resolution is driven by the inner tracking system. Muons with \(p_T > 25\text{ GeV}\) and \(|\eta| < 2.1\) are selected, which is consistent with the acceptance of the single muon trigger. A relative isolation variable is computed as discussed for electrons, but in a cone of radius \(\Delta R = 0.4\) and with an isolation selection requirement of less than 12%.

The acceptance for W or Z boson events is the fraction of generated events for which the leptons satisfy the restrictions on \(\eta\) and \(p_T\). The event selection criteria will select a subset of the accepted events, and the efficiency specifies the fraction of events selected. This accounts for example for the region of the ECAL from \(1.44 < |\eta| < 1.55\). Other effects, like crystal boundaries, are accounted in the efficiency to reconstruct leptons. Using this acceptance definition, we are able to separate experimental from theoretical uncertainties in the measurement. The detector response is simulated using a detailed description of the CMS detector, based on the \text{GEANT4}\ package \[24\]. Additional proton-proton interactions are taken into account using an admixture of simulated minimum bias events and the same reconstruction code is applied for data and simulated events. Data to simulation ratios of efficiencies are used as scale factors. No single event generator gives a reliable description of both EW and QCD effects. The acceptance is estimated using Monte Carlo simulation based on \text{POWHEG}\[25\text{–}28\]. The effects of nonperturbative QCD, higher-order QCD, and electroweak corrections on the estimated acceptance are investigated using specific simulation tools, from which uncertainties are derived \[7\text{–}10\text{,}29\text{,}30\]. The uncertainty related to the PDFs is estimated following closely the prescription of the PDF4LHC working group \[31\] to combine uncertainties related to the choice of the NLO PDF and the strong coupling constant, \(\alpha_s\).

The W boson candidate events are required to have an identified electron or muon. The W boson signal and background yields are obtained from the \(E_T^{\text{miss}}\) distributions using a binned maximum-likelihood fit. The missing transverse energy is calculated with the particle-flow algorithm by adding the transverse energy vectors of all identified particles. An accurate \(E_T^{\text{miss}}\) measurement is essential to distinguish the W signal from QCD multijet backgrounds. To account for shortcomings of the simulation in modeling the recoil against the W boson, a correction is derived from a Z boson sample. The recoil in these events is studied, in data as well as in simulation, and the differences are propagated to the W boson simulation as a function of the \(p_T\) of the generated W or Z boson. Other background processes from \(W \rightarrow \tau \nu\), Drell–Yan, di-boson, and top-pair production also become significant at high \(E_T^{\text{miss}}\), contributing about 6% of the total selected yield. The background contribution from cosmic rays in the \(W \rightarrow \mu \nu\) channel is negligible. The \(E_T^{\text{miss}}\) model is fitted to the observed distribution as the sum of three contributions: the W signal, the QCD background, and other backgrounds. The QCD background is modeled by an analytic function, while the signal and EW backgrounds are modeled with
The EW contributions are normalized to the W signal yield in the fit through the ratios of the theoretical cross sections. Figure 1 shows the $E_{\text{miss}}$ distributions of the inclusive W boson samples and the results of the fit.

To extract the Z boson yield, the events in the dilepton mass window are counted. The yields contain a contribution of 3% from $\gamma^*$-mediated processes, including interference effects, as estimated with MCFM \[32\]. Background contamination is estimated from simulation to be about 0.4%. Figure 2 shows the dilepton mass distributions of the inclusive Z samples. The signal yields, the acceptances, and the efficiencies are summarized in Appendix A.

Figure 1: The missing transverse energy distributions for W boson candidate events in the electron (left) and muon (right) final states. The variable $\chi$ shown in the lower plot is defined as $(N_{\text{obs}} - N_{\text{exp}}) / \sqrt{N_{\text{obs}}}$, where $N_{\text{obs}}$ is the number of observed events and $N_{\text{exp}}$ is the total of the fitted signal and background yields.

The systematic uncertainties are summarized in Table 1 for the electron and muon channels. The methods used to extract the systematic uncertainties for the acceptance, efficiency, and signal extraction follow closely the W and Z boson cross section measurements performed at $\sqrt{s} = 7$ TeV \[11\]. The leading experimental uncertainty comes from the measurement of the lepton reconstruction and identification efficiency. Other uncertainties come from the integrated luminosity of the data sample and theoretical uncertainties, which are dominated by the PDF uncertainties.

The luminosity of the data sample is measured with an uncertainty of 2.6% by counting the number of clusters per event in the silicon pixel detector. The highly granular detector, consisting of $\sim$60 million channels, guarantees an excellent linearity of the pixel detector response versus pileup. The method is calibrated by means of a procedure pioneered by van der Meer \[39\], consisting of beam scans along the vertical and horizontal directions. This van der Meer technique determines the luminosity at the percent level from a measurement of the beam parameters \[40\]. The dominant contribution to the luminosity uncertainty originates from the assumptions on the functional form of the beam shapes.

The theoretical predictions of cross sections and cross section ratios are computed at NNLO with the program FEWZ \[41\] and the MSTW2008 \[42\] set of PDFs. The uncertainties in these predictions, at the 68% confidence level (CL), include contributions from the uncertainty of the strong coupling constant $\alpha_s$ \[43, 44\], the choice of heavy-quark masses (charm and bottom

| Total                                       | 4.5   | 3.5   | 4.6 | 3.8       | 4.6 | 3.6 |

The results in the electron and muon decay channels are compatible with a p-value of 0.42. Assuming universality of lepton couplings to W and Z bosons, the channels are combined by calculating an average cross section value weighted by their statistical and systematic uncertainties, taking into account the correlated uncertainties. The two leptonic decay channels are combined by assuming fully correlated uncertainties for the acceptance and luminosity, but with other uncertainties assumed to be uncorrelated.

In measurements of the ratios of cross sections some systematic uncertainties cancel, most importantly the uncertainty in the luminosity. The uncertainties in the lepton reconstruction and identification are treated as uncorrelated and the resulting experimental uncertainty in the ratio measurements can therefore be larger than for individual cross section measurements. A summary of the measurements is given in Table 2 including the results obtained within the fiducial
regions in $p_T$ and $\eta$. See Appendix for the total cross sections times branching fractions and ratios for the electron and muon decay channels.

The upper two plots in Fig. show the measured and predicted W versus Z and W$^+$ versus W$^-$ cross sections for different PDF sets. The uncertainties in the theoretical predictions correspond to the PDF uncertainties only. This approach eliminates the need to propagate acceptance uncertainties originating from the PDFs and higher-order corrections into the measurement. The final measurement is compared with the predicted cross sections in the acceptance region for three different PDFs with their respective uncertainty bands propagated through the prediction.

In summary, we have performed the first measurements of total and fiducial inclusive W and Z production cross sections times branching fractions in pp collisions at $\sqrt{s} = 8$ TeV using $18.2 \pm 0.5$ pb$^{-1}$ of low-pileup data recorded with the CMS detector. The W and Z bosons are observed via their decays to electrons and muons. The measured total inclusive production cross sections times branching fractions are $\sigma(pp \to WX) \times B(W \to \ell \nu) = 12.21 \pm 0.03$ (stat.) $\pm 0.24$ (syst.) $\pm 0.32$ (lum.) nb and, for the dilepton mass in the range of 60 to 120 GeV, $\sigma(pp \to ZX) \times B(Z \to \ell^+ \ell^-) = 1.15 \pm 0.01$ (stat.) $\pm 0.02$ (syst.) $\pm 0.03$ (lum.) nb. In addition to the inclusive cross sections, we present ratios of cross sections measured with a precision of 2%.

The measurements in the electron and muon channels are consistent, and in agreement with NNLO calculations. Additional figures summarizing our measurements are available in Appendix A.

We congratulate our colleagues in the CERN accelerator departments for the excellent performance of the LHC and thank the technical and administrative staffs at CERN and at other CMS institutes for their contributions to the success of the CMS effort. In addition, we gratefully acknowledge the computing centres and personnel of the Worldwide LHC Computing Grid for delivering so effectively the computing infrastructure essential to our analyses. Finally, we acknowledge the enduring support for the construction and operation of the LHC and the CMS detector provided by the following funding agencies: BMWF and FWF (Austria); FNRS and FWO (Belgium); CNPq, CAPES, FAPERJ, and FAPESP (Brazil); MES (Bulgaria); CERN; CAS, MoST, and NSFC (China); COLCIENCIAS (Colombia); MSES and CSF (Croatia); RPF (Cyprus); MoER, SF0690030s09 and ERDF (Estonia); Academy of Finland, MEC, and HIP (Finland); CEA and CNRS/IN2P3 (France); BMBF, DFG, and HGF (Germany); GSRT (Greece); OTKA and NIH (Hungary); DAE and DST (India); IPM (Iran); SFI (Ireland); INFN (Italy); NRF and WCU (Republic of Korea); LAS (Lithuania); MOE and UM (Malaysia); CINVESTAV, CONACYT, SEP, and UASLP-FAI (Mexico); MBIE (New Zealand); PAEC (Pakistan); MSHE and NSC (Poland); FCT (Portugal); JINR (Dubna); MON, RosAtom, RAS and RFBR (Russia); MESTD (Serbia); SEIDI and CPAN (Spain); Swiss Funding Agencies (Switzerland); NSC (Taipei); ThEPCenter, IPST, STAR and NSTDA (Thailand); TUBITAK and TAEK (Turkey); NASU (Ukraine); STFC

Figure 4: Measurements of the total $W^+$, $W^-$, $W$, and $Z$ production cross sections times branching fractions versus center-of-mass energy for CMS and experiments at lower-energy colliders [33–38]. The predicted increase of the cross sections with center-of-mass energy is confirmed by our measurements.
Figure 5: Summary of total inclusive $W^+$, $W^-$, $W$, and $Z$ production cross sections times branching fractions, $W$ to $Z$ and $W^+$ to $W^-$ ratios, and their theoretical predictions. The shaded box indicates the uncertainties in the luminosity measurement. The inner error bars represent the experimental uncertainties, while outer error bars also include the uncertainties in the theoretical predictions. The individual measurements and theoretical predictions are given numerically on the right.
Figure 6: Summary of fiducial inclusive $W^+$, $W^-$, $W$, and $Z$ production cross sections times branching fractions, $W$ to $Z$ and $W^+$ to $W^-$ ratios, and their theoretical predictions. The shaded box indicates the uncertainties in the luminosity measurement. The inner error bars represent the experimental uncertainties, while outer error bars also include the uncertainties in the theoretical predictions. The individual measurements and theoretical predictions are given numerically on the right.

Pegna, P. Lujan, D. Marlow, T. Medvedeva, M. Mooney, J. Olsen, P. Piroué, X. Quan, A. Raval, H. Saka, D. Stickland, C. Tully, J.S. Werner, S.C. Zenz, A. Zuranski

**University of Puerto Rico, Mayaguez, USA**
E. Brownson, A. Lopez, H. Mendez, J.E. Ramirez Vargas

**Purdue University, West Lafayette, USA**
E. Alagoz, D. Benedetti, G. Bolla, D. Bortoletto, M. De Mattia, A. Everett, Z. Hu, M. Jones, K. Jung, O. Koybasi, M. Kress, N. Leonardo, V. Maroussov, P. Merkel, D.H. Miller, N. Neumeister, I. Shipsey, D. Silvers, A. Svyatkovskiy, M. Vidal Marono, F. Wang, L. Xu, H.D. Yoo, J. Zablocki, Y. Zheng

**Purdue University Calumet, Hammond, USA**
S. Guragain, N. Parashar

**Rice University, Houston, USA**
A. Adair, B. Akgun, K.M. Ecklund, F.J.M. Geurts, W. Li, B.P. Padley, R. Redjimi, J. Roberts, J. Zabel

**University of Rochester, Rochester, USA**
B. Betchart, A. Bodek, R. Covarelli, P. de Barbaro, R. Demina, Y. Eshaq, T. Ferbel, A. Garcia-Bellido, P. Goldenzweig, J. Han, A. Harel, D.C. Miner, G. Petrillo, D. Vishnevskiy, M. Zielinski

**The Rockefeller University, New York, USA**
A. Bhatti, R. Ciesielski, L. Demortier, K. Goulianos, G. Lungu, S. Malik, C. Mesropian

**Rutgers, The State University of New Jersey, Piscataway, USA**
S. Arora, A. Barker, J.P. Chou, C. Contreras-Campana, E. Contreras-Campana, D. Duggan, D. Ferencek, Y. Gershtein, R. Gray, E. Halkiadakis, D. Hidas, A. Lath, S. Panwalkar, M. Park, R. Patel, V. Rekovic, J. Robles, K. Rose, S. Salur, S. Schnetzer, C. Seitz, S. Somalwar, R. Stone, S. Thomas, M. Walker

**University of Tennessee, Knoxville, USA**
G. Cerizza, M. Hollingsworth, S. Spanier, Z.C. Yang, A. York

**Texas A&M University, College Station, USA**
O. Bouhali61, R. Eusebi, W. Flanagan, J. Gilmore, T. Kamon62, V. Khotilovich, R. Montalvo, I. Osipenkov, Y. Pakhotin, A. Perloff, J. Roe, A. Safonov, T. Sakuma, I. Suarez, A. Tatarinov, D. Tobjak

**Texas Tech University, Lubbock, USA**
N. Akchurin, J. Damgov, C. Dragoiu, P.R. Dudero, C. Jeong, K. Kovitanggoon, S.W. Lee, T. Libeiro, I. Volobouev

**Vanderbilt University, Nashville, USA**
E. Appelt, A.G. Delannoy, S. Greene, A. Gurrola, W. Johns, C. Maguire, Y. Mao, A. Melo, M. Sharma, P. Sheldon, B. Snook, S. Tuo, J. Velkovska

**University of Virginia, Charlottesville, USA**
M.W. Arenton, S. Boutle, B. Cox, B. Francis, J. Goodell, R. Hirosky, A. Ledovskoy, C. Lin, C. Neu, J. Wood

**Wayne State University, Detroit, USA**
S. Gollapinni, R. Harr, P.E. Karchin, C. Kottachchi Kankanamge Don, P. Lamichhane, A. Sakharov
University of Wisconsin, Madison, USA
M. Anderson, D.A. Belknap, L. Borrello, D. Carlsmit, M. Cepeda, S. Dasu, E. Friis, K.S. Grogg, M. Grothe, R. Hall-Wilton, M. Herndon, A. Hervé, K. Kaadze, P. Klabbers, J. Klukas, A. Lanaro, C. Lazaridis, R. Loveless, A. Mohapatra, M.U. Mozer, I. Ojalvo, G.A. Pierro, I. Ross, A. Savin, W.H. Smith, J. Swanson

†: Deceased
1: Also at Vienna University of Technology, Vienna, Austria
2: Also at CERN, European Organization for Nuclear Research, Geneva, Switzerland
3: Also at Institut Pluridisciplinaire Hubert Curien, Université de Strasbourg, Université de Haute Alsace Mulhouse, CNRS/IN2P3, Strasbourg, France
4: Also at National Institute of Chemical Physics and Biophysics, Tallinn, Estonia
5: Also at Skobeltsyn Institute of Nuclear Physics, Lomonosov Moscow State University, Moscow, Russia
6: Also at Universidade Estadual de Campinas, Campinas, Brazil
7: Also at California Institute of Technology, Pasadena, USA
8: Also at Laboratoire Leprince-Ringuet, Ecole Polytechnique, IN2P3-CNRS, Palaiseau, France
9: Also at Zewail City of Science and Technology, Zewail, Egypt
10: Also at Suez Canal University, Suez, Egypt
11: Also at Cairo University, Cairo, Egypt
12: Also at Fayoum University, El-Fayoum, Egypt
13: Also at British University in Egypt, Cairo, Egypt
14: Now at Ain Shams University, Cairo, Egypt
15: Also at National Centre for Nuclear Research, Swierk, Poland
16: Also at Université de Haute Alsace, Mulhouse, France
17: Also at Joint Institute for Nuclear Research, Dubna, Russia
18: Also at Brandenburg University of Technology, Cottbus, Germany
19: Also at The University of Kansas, Lawrence, USA
20: Also at Institute of Nuclear Research ATOMKI, Debrecen, Hungary
21: Also at Eötvös Loránd University, Budapest, Hungary
22: Also at Tata Institute of Fundamental Research - EHEP, Mumbai, India
23: Also at Tata Institute of Fundamental Research - HECR, Mumbai, India
24: Now at King Abdulaziz University, Jeddah, Saudi Arabia
25: Also at University of Visva-Bharati, Santiniketan, India
26: Also at University of Ruhuna, Matara, Sri Lanka
27: Also at Sharif University of Technology, Tehran, Iran
28: Also at Isfahan University of Technology, Isfahan, Iran
29: Also at Plasma Physics Research Center, Science and Research Branch, Islamic Azad University, Tehran, Iran
30: Also at Università degli Studi di Siena, Siena, Italy
31: Also at Universidad Michoacana de San Nicolas de Hidalgo, Morelia, Mexico
32: Also at St. Petersburg State Polytechnical University, St. Petersburg, Russia
33: Also at Faculty of Physics, University of Belgrade, Belgrade, Serbia
34: Also at Facoltà Ingegneria, Università di Roma, Roma, Italy
35: Also at Scuola Normale e Sezione dell’INFN, Pisa, Italy
36: Also at INFN Sezione di Roma, Roma, Italy
37: Also at University of Athens, Athens, Greece
38: Also at Rutherford Appleton Laboratory, Didcot, United Kingdom
39: Also at Paul Scherrer Institut, Villigen, Switzerland
40: Also at Institute for Theoretical and Experimental Physics, Moscow, Russia
41: Also at Albert Einstein Center for Fundamental Physics, Bern, Switzerland
42: Also at Gaziosmanpasa University, Tokat, Turkey
43: Also at Adiyaman University, Adiyaman, Turkey
44: Also at Cag University, Mersin, Turkey
45: Also at Mersin University, Mersin, Turkey
46: Also at Izmir Institute of Technology, Izmir, Turkey
47: Also at Ozyegin University, Istanbul, Turkey
48: Also at Kafkas University, Kars, Turkey
49: Also at Suleyman Demirel University, Isparta, Turkey
50: Also at Ege University, Izmir, Turkey
51: Also at Mimar Sinan University, Istanbul, Istanbul, Turkey
52: Also at Kahramanmaraş Sütçü İmam University, Kahramanmaraş, Turkey
53: Also at School of Physics and Astronomy, University of Southampton, Southampton, United Kingdom
54: Also at INFN Sezione di Perugia; Università di Perugia, Perugia, Italy
55: Also at Utah Valley University, Orem, USA
56: Also at Institute for Nuclear Research, Moscow, Russia
57: Also at University of Belgrade, Faculty of Physics and Vinca Institute of Nuclear Sciences, Belgrade, Serbia
58: Also at Argonne National Laboratory, Argonne, USA
59: Also at Erzincan University, Erzincan, Turkey
60: Also at Yildiz Technical University, Istanbul, Turkey
61: Also at Texas A&M University at Qatar, Doha, Qatar
62: Also at Kyungpook National University, Daegu, Korea
