Helffer-Sjöstrand formula for Unitary Operators.

MBAREK Aiman

16 juin 2015

ABSTRACT. The objective of this paper to give a formula for unitary operators that corresponds to the Helffer-Sjöstrand formula for self-adjoint operators.

1 Introduction

First, we recall the usual formula of Helffer-Sjöstrand. If \( f : \mathbb{R} \to \mathbb{C} \) a smooth function with compact support and \( A \) is a self-adjoint operator on a Hilbert space \( \mathcal{H} \), we have

\[
f(A) = (2i\pi)^{-1} \int_C \partial_z f^C(z)(z - A)^{-1} dz \wedge d\bar{z}.
\]

Here \( f^C \) is some almost analytic extension of \( f \), \( dz \wedge d\bar{z} \) is the Lebesgue measure on the complex plane, \( \partial_z = \frac{1}{2}(\partial_x + i\partial_y) \) for \( z = x + iy \), and \( f(A) \) is given by the functional calculus for the self-adjoint operator \( A \). This formula also holds true for a larger class of functions \( f \) having some prescribed behaviour at infinity (See. \{DG, GJ, ...\}). For instance (See [DG]), one can require, for \( \rho < 0 \), that

\[
\forall k \in \mathbb{N}, \sup_{t \in \mathbb{R}} \langle t \rangle^{-\rho+k}|f^{(k)}(t)| < +\infty.
\]

The Helffer-Sjöstrand formula is extensively used in many different works, for example (DG, GJ, BG, Ca, GN, ...). A first application is an expansion of commutators of the following type. Given \( f \) a smooth function on \( \mathbb{R} \) with compact support, \( A \) a self-adjoint operator and \( B \) a bounded operator satisfying certain properties on a Hilbert space \( \mathcal{H} \), one has

\[
[f(A), B] = f'(A)[A, B] + R,
\]

where \([A, B]\) is the commutator of \( A \) and \( B \), \( f(A) \) is given by the functional calculus for \( A \) and \( R \) is a rest that has better properties in some sense. One can generalize this formula with iterated commutators \([[A, [A, B]], [A, [A, [A, B]]], ...]] \) to get a Taylor-type formula.

A second application is provided in GN. Given a self-adjoint operator \( A \) on \( \mathcal{H} \) and a smooth function \( f \) on \( \mathbb{R} \) with compact support, one gets a control on the norm...
\[ \|f(A)\|_{\mathcal{B}(\mathcal{H})} \text{ in terms of the norm of the resolvent of } A, \| (A - z_0)^{-1} \|_{\mathcal{B}(\mathcal{H})}, \text{ for some } z_0 \in \mathbb{C} \setminus \mathbb{R}. \] There are also results of this kind where \( \mathcal{B}(\mathcal{H}) \) is replaced by a Schatten class norm.

Let us mention a third application in the context of linear PDE. For \( \zeta > 0 \), let \( V \) be the multiplication operator by a function \( V : \mathbb{R}^d \to \mathbb{R}, x \mapsto V(x) \) such that \( x \mapsto |\langle x \rangle\zeta \cdot V| \) is bounded, \( \langle Q \rangle \) be the multiplication operator by the map \( x \mapsto \langle x \rangle = (1 + |x|^2)^{\frac{1}{2}} \), \( f \) be a smooth function on \( \mathbb{R} \) with compact support and \( -\Delta \) be the positive Laplacian on \( \mathbb{R}^d \). Let \( H_1 = H_0 + V = -\Delta + V \), the self-adjoint realization in \( L^2(\mathbb{R}^d) \). By the Helffer-Sjöstrand formula one can show that

\[ \left( (f(H_1) - f(H_0)) \langle Q \rangle^\varepsilon \langle H_0 \rangle^\alpha \right)_{0 \leq \varepsilon < \zeta, 0 \leq \alpha < 1} \]

is a family of compact operators.

Our objective is to find a kind of Helffer-Sjöstrand formula for unitary operators \( U \) and for smooth functions defined on the 1-dimensional sphere \( S^1 \). Since \( U \) is a unitary operator, its spectrum is contained in \( S^1 \) and a functional calculus is well defined. Here we shall take a smooth function \( f : S^1 \to \mathbb{C} \) with compact support in the interior of \( S^1 \setminus \{1\} \). The latter condition corresponds to the condition of compact support for the Helffer-Sjöstrand formula. For a unitary operator \( U \) on some Hilbert space \( \mathcal{H} \), we shall derive the formula

\[ f(U) = (2i\pi)^{-1} \int_C \partial_z f^C_{S^1}(z)(z - U)^{-1} dz \wedge d\bar{z}, \tag{1.1} \]

where \( f^C_{S^1} \) is some almost analytic extension of \( f \), \( dz \wedge d\bar{z} \) is the Lebesgue measure on the complex plane and \( f(U) \) is given by the functional calculus for \( U \). We will show the formula \((1.1)\) in Theorem \((1.3)\). We expect that our formula \((1.1)\) holds true under a weaker assumption on the behaviour of \( f \) near 1.

The tools used in this paper come from complex analysis (Cayley transform...), the theory of self-adjoint, unitary and normal operators and the functional calculus for the corresponding operators.

The paper is organized as follows. In Section 2, we formulate the theorem of Helffer-Sjöstrand and we give a slightly different proof from that of \cite{HeS}. In Section 3, we recall some properties on the Cayley transform and we prove some complex analysis results that will be used in the proof of our main theorem. In Section 4, we prove the main theorem of this paper. The paper ends with a paragraph of notation.

I would like to thank S. Golénia, who drew our attention to the fact that a formula of the type \((1.1)\) should exist and would be very interesting and useful. I also thank T. Jecko for guiding, abetting, counseling me throughout the preparation of this paper.
2 Usual Helffer-Sjöstrand formula

We state the theorem of Helffer Sjöstrand and we will give another proof other than in the article [HeS]. Our proof is based on results in [DG] and results of complex analysis.

First we will start with constructing almost analytic extensions.

Let \( k : \mathbb{C} \rightarrow \mathbb{C} \) be a map, we denote by \( \text{suppk} \) the support of \( k \).

**Proposition 2.1** [DG] Let \( f \) a smooth function on \( \mathbb{R} \) with compact support. Then there exists a smooth function \( f^C : \mathbb{C} \rightarrow \mathbb{C} \), called an almost analytic extension of \( f \), such that there exists \( 0 < C < 1 \) such that for all \( l \in \mathbb{N} \) there exists \( C_l \geq 0 \) such that,

\[
f^C|_{\mathbb{R}} = f, \text{suppf}^C \subset \{ x + iy; x \in \text{suppf}, |y| \leq C \}, \tag{2.2}
\]

\[
|\partial_z f^C(z)| \leq C_l |\text{Im}(z)|^l. \tag{2.3}
\]

where \( \text{Im}(z) \) is the imaginary part of \( z \).

**Proof**: we follow the argument of [DG], checking that we can ensure the formula (2.2) with \( C < 1 \).

Let \( M_n = \sup_{0 \leq k \leq n} \sup_{x \in \mathbb{R}} |f^{(k)}(x)| \) for all \( n \in \mathbb{N} \). Let \( \chi \in C^\infty(\mathbb{R}) \) such that \( \chi = 1 \) on \([-1/2, 1/2]\) and \( \chi = 0 \) on \( \mathbb{R} \setminus [-1, 1] \). We choose

\[
f^C(z) = f^C(x + iy) = \sum_{n=0}^{+\infty} \frac{(iy)^n}{n!} f^{(n)}(x) \chi \left( \frac{y}{T_n} \right), \tag{2.4}
\]

for a decreasing and positive sequence \( (T_n)_n \) satisfying, \( T_0 < 1 \) and

\[
\forall n \in \mathbb{N}, \quad T_n M_{2n} \leq 2^{-n}. \tag{2.5}
\]

For example we can take \( (T_n)_n \) defined by \( 0 < T_0 < 1 \) and \( T_n = \min(T_{n-1}, \frac{1}{2^{T_{2n}}}) \), for \( n \geq 1 \). With this choice we will see that our sum (2.4) is uniformly convergent. Then, for \( x \) real,

\[
f^C(x) = \sum_{n=0}^{+\infty} \frac{(i0)^n}{n!} f^{(n)}(x) \chi \left( \frac{0}{T_n} \right) = \frac{(i0)^0}{0!} f(x) \chi \left( \frac{0}{T_0} \right) = f(x).
\]

We deduce that \( f^C \) is an extension of \( f \) to \( \mathbb{C} \).

Let \( C = T_0 \). Let \( H_{f,C} := \{ x + iy; x \in \text{suppf}, |y| \leq C \} \). If \( x_0 + iy_0 \in \mathbb{C} \) such that the distance \( d(x_0 + iy_0, H_{f,C}) > 0 \) then \( x_0 \notin \text{suppf} \) or \( |y_0| > C \). If \( x_0 \notin \text{suppf} \) therefore \( f^{(n)}(x_0) = 0, n \geq 0 \) for all \( n \in \mathbb{N} \), and \( f^C(x_0 + iy_0) = 0 \). If \( |y_0| > C \) then, for all \( n \in \mathbb{N} \), \( |y_0| > C \geq T_n \), since \( (T_n)_n \) decreases. Thus, for all \( n \), \( \chi \left( \frac{T_n}{T_n} \right) = 0 \) and \( f^C(x_0 + iy_0) = 0 \). We get (2.2)

To show that our sum (2.4) exists and belongs to \( C^\infty(\mathbb{C}) \), we simply have to show that, for \( (p, q) \in \mathbb{N}^2 \),
\[
\sum_{n \in \mathbb{N}} \partial_x^p \partial_y^q \left( \frac{(iy)^n}{n!} f^{(n)}(x) \chi \left( \frac{y}{T_n} \right) \right) \quad (2.6)
\]

is uniformly convergent.

Let \((p, q) \in \mathbb{N}^2\), take \(n \geq \max(p, q)\). Using the Leibnitz formula we have

\[
\left| \partial_x^p \partial_y^q \left( \frac{(iy)^n}{n!} f^{(n)}(x) \chi \left( \frac{y}{T_n} \right) \right) \right| = \left| i^n (\partial_x^{p+n} f)(x) \sum_{r=0}^{q} \frac{C^r_q}{(n-q+r)!} T_n^{r} y^{n-q+r} \chi^{(r)} \left( \frac{y}{T_n} \right) \right| \quad (2.7)
\]

where \(C^r_q = \frac{q!}{r!(q-r)!}\), \(0 \leq r \leq q\). For all \(0 \leq r \leq q, \chi^{(r)}(\frac{y}{T_n})\) is supported in \(\{0 \leq | \cdot | \leq T_n\}\).

Let \(x, y \in \mathbb{R}\), we have

\[
\left| \partial_x^p \partial_y^q \left( \frac{(iy)^n}{n!} f^{(n)}(x) \chi \left( \frac{y}{T_n} \right) \right) \right| \leq M_{p+n} \sum_{r=0}^{q} \frac{C^r_q}{(n-q+r)!} T_n^{r} |y|^{n-q+r} \chi^{(r)} \left( \frac{y}{T_n} \right) \]
\[
\leq M_{p+n} T_n^{q-n} \sum_{r=0}^{q} \frac{C^r_q}{(n-q+r)!} M_{q-n} \chi^{(r)} \| \chi^{(r)} \|_{\infty} \quad (2.8)
\]

As \(T_n < 1\), we have \(T_n^{q-n} M_{p+n} \leq T_n M_{2n} \leq 2^{-n}\), by (2.5).

Thus

\[
\sup_{x, y} \left| \partial_x^p \partial_y^q \left( \frac{(iy)^n}{n!} f^{(n)}(x) \chi \left( \frac{y}{T_n} \right) \right) \right| \leq D_q 2^{-n}.
\]

This yields the normal convergence of the series (2.6). In particular, \(f^C \in C^{\infty}(\mathbb{C})\).

It remains to show (2.8). For \(x, y \in \mathbb{R}\)

\[
2 \partial_x f^C(z) = (\partial_x + i \partial_y) f^C(x + iy) = \sum_{n=0}^{+\infty} \left( \frac{(iy)^n}{n!} f^{(n+1)}(x) \chi \left( \frac{y}{T_n} \right) + i \frac{f^{(n)}(x)}{(n-1)!} y^{n-1} \chi \left( \frac{y}{T_n} \right) \right) \]
\[
= f'(x) \chi \left( \frac{y}{T_n} \right) + \sum_{n=1}^{+\infty} \frac{(iy)^n}{n!} f^{(n+1)}(x) \chi \left( \frac{y}{T_n} \right) + i \sum_{n=0}^{+\infty} \frac{f^{(n)}(x)}{(n-1)!} \left( i^n y^{n-1} \chi \left( \frac{y}{T_n} \right) \right) \]
\[
= f'(x) \chi \left( \frac{y}{T_n} \right) + \sum_{n=1}^{+\infty} \frac{(iy)^n}{n!} f^{(n+1)}(x) \chi \left( \frac{y}{T_n} \right) - \chi \left( \frac{y}{T_{n+1}} \right) \]
\[
+ \sum_{n=0}^{+\infty} \frac{f^{(n)}(x)}{n! T_n} i^n y^n \chi' \left( \frac{y}{T_n} \right). \quad (2.9)
\]
Let \( l \in \mathbb{N} \). Denoting by \( 1_I \) the characteristic function of \( I \), we have, for \( y \neq 0 \),

\[
2\left|y\right|^{-l} \partial_y \tilde{f}(z) \leq \left( \frac{T_n}{2} \right)^{-l} M_l \left\| \chi \right\|_\infty + \sum_{n=1}^{+\infty} M_{n+1} \left| y \right|^{n-l} 2 \left\| \chi \right\|_\infty 1_{\{ T_{n+1}/2 \leq |z| \leq T_n \}}(y) \\
+ \sum_{n=0}^{+\infty} \frac{M_n}{T_n} \left| y \right|^{n-l} \left\| \chi' \right\|_\infty 1_{\{ T_n/2 \leq |z| \leq T_n \}}(y) \\
\leq C + C' \sum_{n=1}^{l} \frac{M_{n+1}}{T_n} \left( \frac{T_n+1}{2} \right)^{n-l} + C'' \sum_{n=l+1}^{+\infty} M_{n+1} (T_n)^{n-l} \\
+ C''' \sum_{n=0}^{l} \frac{M_n}{T_n} \left( \frac{T_n}{2} \right)^{n-l} + C'''' \sum_{n=l+1}^{+\infty} \frac{M_n}{T_n} (T_n)^{n-l} \\
\leq C' + D \sum_{n=l+2}^{+\infty} (M_n + M_{n+1}) T_n. \tag{2.10}
\]

By (2.3) and the definition of \( (M_n)_n \) we have \( (M_n + M_{n+1}) T_n \leq 2T_n M_{2n} \leq 2.2^{-n} \).
This yields (2.3).

\[ \blacksquare \]

**Proposition 2.2 [HI]**

Let \( \omega \) be an open set in the complex plane \( \mathbb{C} \) and \( u \in C^1(\omega) \). For all \( \xi \in \omega \), the second integral in (2.11) below is convergent. Moreover, for all \( \xi \in \omega \),

\[
\begin{align*}
\omega \left( \frac{1}{\xi} \right) = (2i\pi)^{-1} \left\{ \int_{\partial \omega} \frac{u(z)}{z - \xi} \, dz + \int_{\omega} \frac{\partial_z u(z)}{z - \xi} \, dz \wedge d\bar{z} \right\}. \tag{2.11}
\end{align*}
\]

**Corollary 2.3** If \( u \in C^\infty(\mathbb{C}) \) with compact support in \( \omega \) then, for all \( \xi \in \omega \),

\[
\begin{align*}
\omega \left( \frac{1}{\xi} \right) = (2i\pi)^{-1} \int_{\omega} \frac{\partial_z u(z)}{z - \xi} \, dz \wedge d\bar{z}. \tag{2.12}
\end{align*}
\]

**Proof** : Just apply Proposition (2.2) and use the fact that \( u \) is zero on \( \partial \omega \). \[ \blacksquare \]

We will recall some results on the theory of normal operators. Let \( f \in C^\infty(\mathbb{R}) \) with compact support \( K \) and let \( N \) is a normal operator on a Hilbert space \( \mathcal{H} \). Denote by \( \mathcal{B}(\mathcal{H}) \) the set of bounded operators on \( \mathcal{H} \) and \( f(N) \) in \( \mathcal{B}(\mathcal{H}) \) given by the functional calculus for \( N \).

**Proposition 2.4 [CD]** For \( z \) outside \( \sigma(N) \), the spectrum of the operator \( N \), we have

\[
\left\| (z - N)^{-1} \right\|_{\mathcal{B}(\mathcal{H})} = \frac{1}{d(z, \sigma(N))}.
\]

**Proposition 2.5 [CD]** Let \( K \) a compact of \( \mathbb{C} \). Let, for \( n \in \mathbb{N}, f_n \in C^\infty(\mathbb{C}) \) with \( \text{supp} f_n \subset K \) and \( f \in C^\infty(\mathbb{C}) \) with \( \text{supp} f \subset K \) such that \( (f_n)_n \) converges to \( f \), uniformly on \( K \). Then \( (f_n(N))_n \) converges to \( f(N) \) for the operator norm.
Proof: 

By combining the lemma (1.9) page 257 and Theorem (4.7) page 321 in the book [Co], we found the following inequality

$$\|f_n(N) - f(N)\|_{\mathcal{B}(\mathcal{H})} \leq \|f_n - f\|_{\infty, K} := \sup_{x \in K} |f_n(x) - f(x)|.$$ 

Therefore by passing to the limit we conclude

$$\lim_{n \to +\infty} \|f_n(N) - f(N)\|_{\mathcal{B}(\mathcal{H})} = 0. \quad \blacksquare$$

If we replace $u$ by an almost analytic extension $f^C$ satisfying (2.3) and take $\omega = \mathbb{C}$, the generalized integral in (2.12) converges uniformly, w.r.t. $\xi$, as proved in the following proposition.

For a map $k : \mathbb{C} \to \mathbb{C}$ and $D \subset \mathbb{C}$, we define

$$\|k\|_{\infty, D} := \sup_{x \in D} |k(x)|. \quad (2.13)$$

**Proposition 2.6** Let $f \in C^\infty(\mathbb{R})$ be a function with compact support $K$ and $f^C$ be an almost analytic extension of $f$ given by Proposition 2.7. We have the following uniform convergence on $K$

$$\lim_{n \to +\infty} \left\| \int_{|Im(z)| > 1/n} \partial_z f^C(z)(z - \cdot)^{-1} dz \wedge d\bar{z} - f(\cdot) \right\|_{\infty, K} = 0. \quad (2.14)$$

**Proof:** Let $f \in C^\infty(\mathbb{R})$ be a function with compact support $K$. By Proposition 2.7, $f^C$ is an almost analytic extension of $f$ such that $\text{supp} f^C \subset K^C$, where

$$K^C := \{(x, y) \in \mathbb{R}^2 ; x \in K, |y| \leq C < 1\}.$$ 

Let $\omega$ an open in the complex plane $\mathbb{C}$ that contains $K^C$. From the corollary 2.3 with $u = f^C$, we have, for all $\xi \in K$,

$$f(\xi) = (2i\pi)^{-1} \int_{\mathbb{C}} \frac{\partial_z f^C(z)}{z - \xi} dz \wedge d\bar{z}. \quad (2.15)$$

Using the (2.12) with $l = 1$, we have, for $\xi \in K$,

$$\int_{K^C} |\partial_z f^C(z)(z - \xi)^{-1}| dz \wedge d\bar{z} \leq C_1 \int_{K^C} |Im(z)||Im(z)|^{-1} dz \wedge d\bar{z} < +\infty. \quad (2.16)$$

Thus this integral (2.15) is absolutely convergent. Now we will show the uniform convergence on $K$, let $\xi \in K$

$$\left| \int_{|Im(z)| > 1/n} \partial_z f^C(z)(z - \xi)^{-1} dz \wedge d\bar{z} - f(\xi) \right|$$

$$= \left| \int_{|Im(z)| < 1/n} \partial_z f^C(z)(z - \xi)^{-1} dz \wedge d\bar{z} \right| \leq C \int_{|Im(z)| < 1/n} |Im(z)||Im(z)|^{-1} dz \wedge d\bar{z} \leq C,$$

where $C$ is independent of $\xi$. 

Therefore
\[
\sup_{\xi \in K} \left| \int_{\mid\text{Im}(z)\mid > 1/n} \partial_z f^C(z)(z - \xi)^{-1} \, dz \wedge d\bar{z} - f(\xi) \right| < \frac{C}{n},
\]
proving (2.14).

We are able to reprove Helffer-Sjöstrand theorem.

**Theorem 2.7 [HeS]** Let \( f \in C^\infty(\mathbb{R}) \) be a function with compact support \( K \) and \( f^C \) be an almost analytic extension of \( f \) given by Proposition 2.1. Let \( A \) be a self-adjoint operator on a Hilbert space \( \mathcal{H} \). The integral
\[
\int_{\mathbb{C}} \| \partial_z f^C(z)(z - A)^{-1} \|_{\mathcal{B}(\mathcal{H})} \, dz \wedge d\bar{z} \tag{2.18}
\]
converges, the integral in the following formula converges in operator norm in \( \mathcal{B}(\mathcal{H}) \), and we have
\[
f(A) = (2i\pi)^{-1} \int_{\mathbb{C}} \partial_z f^C(z)(z - A)^{-1} \, dz \wedge d\bar{z}. \tag{2.19}
\]

**Proof**: By Proposition 2.4, (2.16) holds true with \( \xi \) replaced by \( A \). This proves the convergence of (2.18). In particular, the integral in (2.19) converges in the operator norm of \( \mathcal{B}(\mathcal{H}) \). By (2.14) and Proposition 2.5 we get (2.19).

## 3 Cayley transform

In this section, we give some properties on the Cayley transform and we prove a known result in complex analysis that will be used in the proof of our main theorem.

We will need some estimates on the Cayley transform on specific regions.

**Définition 3.1** The Cayley transform is the map
\[
\psi : \mathbb{C} \setminus \{i\} \rightarrow \mathbb{C} \setminus \{1\}, \quad z \mapsto \psi(z) = \frac{z + i}{z - i}. \tag{3.20}
\]

We denote by \( \mathbb{S}^1 \) is the unit sphere in \( \mathbb{C} \), \( D(0, 1) \) the open disk with center the origin and of radius 1, \( \overline{D}(0, 1) \) the closure of \( D(0, 1) \), \( \mathbb{C}^+ = \{ z \in \mathbb{C}; \text{Im}(z) > 0 \} \) and \( \mathbb{C}^- = \{ z \in \mathbb{C}; \text{Im}(z) < 0 \} \), where \( \text{Im}(z) \) is the imaginary part of \( z \).

**Proposition 3.2** [H] \( \psi \) is an analytic, bijective function and \( \psi^{-1} \) is given by \( \psi^{-1}(\xi) = i\frac{\xi + 1}{\xi - 1} \), for all \( \xi \in \mathbb{C} \setminus \{1\} \). Furthermore, \( \psi(\mathbb{R}) = \mathbb{S}^1 \setminus \{1\} \), \( \psi(\mathbb{C}^-) = D(0, 1) \), \( \psi(\mathbb{C}^+ \setminus \{i\}) = \mathbb{C} \setminus \overline{D}(0, 1) \), \( \psi(0) = -1, \psi(-1) = i \), \( \lim_{z \to \infty} \psi(z) = 1 \), \( \lim_{z \to i} \psi(z) = \infty \).

Let \( a, b, c \in \mathbb{R} \) such that \( a < b \) and \( 0 \leq c < 1 \). We define
\[
\Omega := \psi([a, b] \times [-c, c]).
\]
Lemma 3.3 There exists $C > 0$, such that
\[
\|\partial_z(\psi^{-1})\|_{\infty, \Omega} \leq C, \|\partial_y(\psi^{-1})\|_{\infty, \Omega} \leq C,
\] (3.21)
and, for all $\xi \in \Omega$,
\[
|\text{Im}(\psi^{-1}(\xi))| \leq C d(\xi, \mathbb{S}^1).
\]
where $\| \cdot \|_{\infty, \Omega}$ defined in (2.13) and $d(\xi, \mathbb{S}^1)$ is the distance between $\xi$ and $\mathbb{S}^1$.

Proof : Let $\xi \in \Omega$. Then $|\text{Im}(\psi^{-1}(\xi))| = \left| \frac{\xi^2-1}{\bar{\xi} - 1} \right|$
\[\frac{|\text{Im}(\psi^{-1}(\xi))|}{d(\xi, \mathbb{S}^1)} = \frac{|\xi| + 1}{|\xi - 1|^2}.\]
Call $C_\Omega = d(1, \Omega) > 0, d_\Omega = \sup_{\xi \in \Omega} |\xi| > 0$. We have, for all $\xi \in \Omega$,
\[
C_1 := \frac{1}{1 + d_\Omega} \leq \frac{1}{|\xi| + 1} \leq \frac{|\text{Im}(\psi^{-1}(\xi))|}{d(\xi, \mathbb{S}^1)} = \frac{|\xi| + 1}{|\xi - 1|^2} \leq \frac{d_\Omega + 1}{C_\Omega^2} =: C_2.
\]
\[
\partial_z(\psi^{-1}) = \frac{2(\bar{\xi} - 1)}{(\xi - 1)^2} \text{ and } \partial_y(\psi^{-1}) = \frac{2}{(\xi - 1)^2}. \]
Since, for all $\xi \in \Omega, |\xi - 1| \geq C_\Omega > 0$, we get (3.21).

Lemma 3.4 Let $h$ be an analytic function on $\mathbb{C}$ and $g$ be a smooth function on $\mathbb{C} \simeq \mathbb{R}^2$. We have
\[
\forall z \in \mathbb{C}, \quad \partial_z(g \circ h)(z) = (\partial_z g)(h(z))\partial_z h(z).
\]

Proof : Writing $z = x + iy$ and $h(z) = h_1(x, y) + ih_2(x, y)$, we have
\[
2\partial_z(g \circ h)(z) = \partial_z(g \circ h)(z) + i\partial_y(g \circ h)(z)
= (\partial_z g)(h(z))\partial_z h_1(x, y) + (\partial_y g)(h(z))\partial_z h_2(x, y)
+ i((\partial_z + \partial_y)(h(z))\partial_y h_1(x, y) + (\partial_y - i\partial_z)(h(z))\partial_y h_2(x, y))
= (\partial_z g)(h(z))(\partial_z h_1(x, y) + i\partial_z h_2(x, y) + i\partial_y h_1(x, y) - \partial_y h_2(x, y))
+ (\partial_y g)(h(z))(\partial_y h_1(x, y) - i\partial_y h_2(x, y) + i\partial_z h_1(x, y) + \partial_z h_2(x, y)).
\] (3.22)
As $h$ is analytic, $h$ satisfies the Cauchy Riemann relations $\partial_z h_1(x, y) = \partial_y h_2(x, y)$ and $\partial_y h_1(x, y) = -\partial_z h_2(x, y)$, therefore
\[
2\partial_z(g \circ h)(z) = 2(\partial_z g)(h(z))(\partial_z h_1(x, y) + i\partial_y h_1(x, y))
= 2(\partial_z g)(h(z))(\partial_z + i\partial_y h_1(x, y))
= 2(\partial_z g)(h(z))(\partial_z \frac{\partial_z + i\partial_y h_1(x, y)}{2} + \frac{\partial_z + i\partial_y h_1(x, y)}{2})
= 2(\partial_z g)(h(z))(\partial_z \frac{\partial_z + i\partial_y h_1(x, y)}{2} + \frac{\partial_z + i\partial_y h_1(x, y)}{2})
\] (3.23)
}\[
= 2(\partial_z g)(h(z))\partial_z h(z).
\]
\[\blacksquare\]
4 Helffer-Sjöstrand formula for Unitary Operators

We want a formula similar to (2.19), replacing the self-adjoint operator $A$ by a unitary operator $U$.

We start with some reminders on unitary operators.

**Définition 4.1** $U$ is called a unitary operator on a Hilbert space $\mathcal{H}$, if

$$UU^* = U^*U = I.$$ 

**Proposition 4.2** The spectrum of a unitary operator $U$ on a Hilbert space $\mathcal{H}$ is included in $S^1$.

**Proof**: Let $z \in \mathbb{C}$ such that $|z| > 1$. We have $\|z^{-1}U\| < 1$, then $(I - z^{-1}U)$ is invertible and its inverse is bounded and it is given by the following series $\sum_{n=0}^{+\infty}(z^{-1}U)^n$.

Therefore $(z - U)z^{-1}(I - z^{-1}U)^{-1} = \sum_{n=0}^{\infty}(z^{-1}U)^n - \sum_{n=0}^{\infty}zU^{-1}(z^{-1}U)^n = I = z^{-1}(I - z^{-1}U)^{-1}(z - U)$, $(z - U)$ is invertible, and $(z - U)^{-1} = z^{-1}(I - z^{-1}U)^{-1}$.

Let now $z \in \mathbb{C}$ such that $|z| < 1$, we have $|zU^*| < 1$, then

$$(z - U)U^*(zU^* - I)^{-1} = \sum_{n=0}^{\infty}zU^*(zU^*)^n - \sum_{n=0}^{\infty}(zU^*)^n = I = (z - U)U^*(zU^* - I)^{-1},$$

$(z - U)$ is invertible, and $(z - U)^{-1} = U^*(zU^* - I)^{-1}$.

This shows that the spectrum of $U$ is included in $S^1$. \hfill $\blacksquare$

We are able to demonstrate the main theorem of this paper.

**Theorem 4.3** Let $f \in \mathcal{C}^\infty(S^1)$ supported away from 1 and $U$ be a unitary operator on a Hilbert space $\mathcal{H}$. Let $(f \circ \psi)^C$ be an almost analytic extension of $f \circ \psi$ given by (2.1) such that $(f \circ \psi)^C$ is supported in $\{ x + iy; x \in \text{supp}(f \circ \psi), |y| \leq C \}, 0 < C < 1$.

Let $f^C_{\mathbb{S}^1} = (f \circ \psi)^C \circ \psi^{-1}$. The integral

$$\int_{\mathbb{C}} \|\partial_z f^C_{\mathbb{S}^1}(z)(z - U)^{-1}\|_{\mathcal{B}(\mathcal{H})} \, dz \wedge d\bar{z} \quad (4.24)$$

converges, the integral in the following formula converges in operator norm in $\mathcal{B}(\mathcal{H})$, and we have

$$f(U) = (2i\pi)^{-1}\int_{\mathbb{C}} \partial_z f^C_{\mathbb{S}^1}(z)(z - U)^{-1} \, dz \wedge d\bar{z}. \quad (4.25)$$

**Proof**: Let $f \in \mathcal{C}^\infty(S^1)$ supported away from 1 and $U$ is a unitary operator on a Hilbert space $\mathcal{H}$.

$f \circ \psi$ is a smooth function on $\mathbb{R}$ with compact support. By Proposition 2.1 there exists an almost analytic extension $(f \circ \psi)^C$ of $f \circ \psi$, such that $(f \circ \psi)^C$ supported in $\{ x + iy; x \in \text{supp}(f \circ \psi), |y| \leq C < 1 \}$. 

Let $f_C^S = (f \circ \psi)^C \circ \psi^{-1}$ defined on $\mathbb{C}$. It is a smooth function, supported in $\Omega_0 := \psi(supp(f \circ \psi) \times [-C, C])$.

For $\xi \in S^1$, $f_C^S(\xi) = (f \circ \psi)^C \circ \psi^{-1}(\xi) = f \circ \psi \circ \psi^{-1}(\xi) = f(\xi)$, since $\psi^{-1}(\xi) \in \mathbb{R}$.

As in the proof of Theorem 2.19 we shall show that (4.24) converges. As $f_C^S \in C^\infty(\mathbb{C})$ with compact support in $\mathbb{C}$ then, for all $\xi \in S^1$,

$$f(\xi) = (2i\pi)^{-1} \int_\mathbb{C} \frac{\partial_z f_C^S(z)}{z - \xi} dz \wedge d\bar{z}$$

by (2.12) with $\omega = \mathbb{C}$.

Making a call to lemma 3.4 with $h = \psi^{-1}$ and $g = (f \circ \psi)^C$ and to proposition 2.1 with $l = 1$, and to lemma 3.3, we get the following uniform convergence on $S^1$,

$$\lim_{n \to +\infty} \left\| \int_\mathbb{C} \partial_z f_C^S(z)(z - \cdot)^{-1} dz \wedge d\bar{z} - f(\cdot) \right\|_{0, S^1} = 0.$$ 

Therefore, by Proposition 2.5,

$$\int_\mathbb{C} \partial_z f_C^S(z)(z - U)^{-1} dz \wedge d\bar{z}$$

converges in operator norm in $\mathcal{B}(\mathcal{H})$ and we have (4.25).

5 Notation

$\mathbb{R}$ is the set of real numbers.
$\mathbb{C}$ is the complex plane.
$S^1$ is the unit sphere in $\mathbb{C}$.
$D(0, 1)$ is the open disk with center at the origin and of radius 1 in $\mathbb{C}$.
$\omega$ is an open set in the complex plane $\mathbb{C}$.
$\partial \omega$ is the boundary of $\omega$ in $\mathbb{C}$.
$Im(z)$ is the imaginary of $z$.
$\mathbb{C}^+ = \{z \in \mathbb{C}; Im(z) > 0\}$.
$\mathbb{C}^- = \{z \in \mathbb{C}; Im(z) < 0\}$.
$\mathbb{C} \setminus D(0, 1)$ is the complementary closed of the disk with center 0 and radius 1 in $\mathbb{C}$.
$C^\infty(\mathbb{R})$ is the set of infinitely differentiable functions on $\mathbb{R}$.
$C^1(\omega)$ is the set of continuously differentiable functions on $\omega$.
$\mathcal{H}$ is a Hilbert space.
$\mathcal{B}(\mathcal{H})$ is the set of bounded operators on $\mathcal{H}$.
$I$ is the identity operator on $\mathcal{H}$.
$\|A\|_{\mathcal{B}(\mathcal{H})} = sup_{\|u\| \neq 0} \|Au\|/\|u\|$.
$\|f\|_{\infty, K} = sup_{x \in K} |f(x)|$.
$dz \wedge d\bar{z}$ is the Lebesgue measure on the complex plane.
$\partial_z = \frac{\partial_{-i\varphi}}{2}$.
$\partial_{\bar{z}} = \frac{\partial_{i\varphi}}{2}$.
$\varphi^{(k)}$ denotes the kth derivative of $\varphi$.
