Abstract New infinite number of one- and two-point Bäcklund transformations (BTs) with explicit expressions are constructed for the high-order constrained flows of the AKNS hierarchy. It is shown that these BTs are canonical transformations including Bäcklund parameter $\eta$ and a spectrality property holds with respect to $\eta$ and the 'conjugated' variable $\mu$ for which the point $(\eta, \mu)$ belongs to the spectral curve. Also the formulas of $m$-times repeated Darboux transformations for the high-order constrained flows of the AKNS hierarchy are presented.

1 Introduction

Bäcklund transformations (BTs) are an important aspect of the theory of integrable systems [1, 2]. It is well-known that the BT’s for soliton equations are canonical transformations (see, for example, [3, 4, 5]). More recently there has been much interest in the property of BTs for finite-dimensional integrable Hamiltonian systems [6, 7, 8, 9, 10]. These BTs are defined as symplectic integrable maps which can be described explicitly and can be viewed as time discretization of particular flows of Liouville integrable systems. They are canonical transformations including Bäcklund parameter $\eta$. For these BTs a spectrality property holds with respect to $\eta$ and the 'conjugated' variable $\mu$ and the point $(\eta, \mu)$ or $(\eta, f(\mu))$ for some function $f(\mu)$ lies on the spectral curve. An important application of the spectrality property of BTs is that to the problem of separation
of variables. In fact, the sequence of Bäcklund parameters \( \eta_j \) together with the conjugate variables \( \mu_j \) constitute the separation variables for the finite-dimensional integrable Hamiltonian systems [6].

We proceed to develop the ideas with some new BTs and study the problem of constructing one- and two-point Bäcklund transformation for the high-order constrained flows of the soliton hierarchy [11, 12, 13]. The Lax representation for the high-order constrained flows can always be deduced from the adjoint representation for the soliton hierarchy [14, 15]. Then, based on the results of Darboux transformations (DTs) for soliton hierarchy [2, 14, 15, 18, 20], we can find the DTs for the high-order constrained flows. By using the Lax representation, these DTs give rise to explicit one- and two-point BTs including one and two Bäcklund parameters \( \eta_i \), respectively. We show these BTs to be canonical transformations by presenting their generating functions. Then we show that these BTs possess the spectrality property with respect to \( \eta \) and conjugate variable \( \mu \) and the pairs \((\eta_i, \mu_i)\) belong to the spectral curve, namely satisfy the separation equations. Few examples of this kind of BTs were presented in [6, 7, 8, 9, 10]. This paper presents a way to find infinite number of BTs with the property described in [6, 7, 8, 9, 10] by means of DTs for the high-order constrained flows of soliton hierarchy. We will use the high-order constrained flows of the AKNS hierarchy to illustrate the ideas.

In section 2, we briefly describe the high-order constrained flows of the AKNS hierarchy. In section 3 we first present three kinds of DTs for the constrained flows of the AKNS hierarchy. Then we find infinite number of new one-point and two-point BTs from the first and third kind of DTs, respectively, and show them to be canonical transformations and possessing the spectrality property by using the first three high-order constrained flows as model in the section 3 and 4, respectively. Finally, the formula for m-times repeated DTs for the constrained flows are presented in section 5.

2 High-order constrained flows of the AKNS hierarchy

Let us briefly describe the high-order constrained flows of AKNS hierarchy. Consider the AKNS spectral problem [21]

\[
\psi_x = U(u, \lambda)\psi \equiv \left( \begin{array}{c} -\lambda & q \\ r & \lambda \end{array} \right) \psi, \quad \psi = \left( \begin{array}{c} \psi_1 \\ \psi_2 \end{array} \right), \quad u = \left( \begin{array}{c} q \\ r \end{array} \right),
\]

(2.1)
and the evolution of $\psi$

$$\psi_t = V^{(n)}(u, \lambda) \psi = \sum_{i=0}^{n} \begin{pmatrix} a_i & b_i \\ c_i & -a_i \end{pmatrix} \lambda^{n-i} \psi,$$  \hspace{1cm} (2.2)

where

$$a_0 = -1, \quad b_0 = c_0 = a_1 = 0, \quad b_1 = q, \quad c_1 = r$$

$$a_2 = \frac{1}{2}qr, \quad b_2 = -\frac{1}{2}q_x, \quad c_2 = \frac{1}{2}r_x, \ldots, $$

and in general

$$\begin{pmatrix} c_{m+1} \\ b_{m+1} \end{pmatrix} = L \begin{pmatrix} c_m \\ b_m \end{pmatrix} = L^m \begin{pmatrix} r \\ q \end{pmatrix}, \quad a_{m,x} = q c_m - r b_m,$$

$$L = \frac{1}{2} \begin{pmatrix} D - 2rD^{-1}q & 2rD^{-1}r \\ -2qD^{-1}q & -D + 2qD^{-1}r \end{pmatrix}, \quad D = \frac{\partial}{\partial x}, \quad DD^{-1} = D^{-1}D = 1.$$

Then the compatibility condition of Eqs. (2.1) and (2.2) gives rise to the AKNS hierarchy [21]

$$u_t = \begin{pmatrix} q \\ r \end{pmatrix}_t = J \begin{pmatrix} c_{n+1} \\ b_{n+1} \end{pmatrix}, \quad J = \frac{\delta H_{n+1}}{\delta u}, \quad n = 0, 1, \ldots, $$  \hspace{1cm} (2.3)

where

$$H_n = \frac{2a_{n+1}}{n}, \quad J = \begin{pmatrix} 0 & -2 \\ 2 & 0 \end{pmatrix}.$$  

We have

$$\frac{\delta \lambda}{\delta q} = \psi^2, \quad \frac{\delta \lambda}{\delta r} = -\psi_1^2.$$  

The high-order constrained flows of the AKNS hierarchy consist of the equations obtained from the spectral problem (2.1) for $N$ distinct $\lambda_j$ and the restriction of the variational derivatives for conserved quantities $H_n$ and $\lambda_j$ [11, 13]

$$\Phi_{1,x} = -\Lambda \Phi_1 + q \Phi_2, \quad \Phi_{2,x} = r \Phi + \Lambda \Phi_2,$$  \hspace{1cm} (2.4a)

$$\frac{\delta H_{n+1}}{\delta u} - \alpha \sum_{j=1}^{N} \frac{\delta \lambda_j}{\delta u} = \begin{pmatrix} c_{n+1} \\ b_{n+1} \end{pmatrix} - \alpha \begin{pmatrix} \langle \Phi_2, \Phi_2 \rangle \\ -\langle \Phi_1, \Phi_1 \rangle \end{pmatrix} = 0,$$  \hspace{1cm} (2.4b)
where we have used \((\phi_{1j}, \phi_{2j})^T\) to denote the solution of (2.1) with \(\lambda = \lambda_j, j = 1, ..., N\) and \(\Phi_i = (\phi_{i1}, ..., \phi_{iN})^T, i = 1, 2, \Lambda = \text{diag}(\lambda_1, ..., \lambda_N), < .. > \) denotes the inner product. The Lax representation for the constrained flow (2.4) is given by \([14, 15]\)

\[
M_x^{(n)} = [U, M^{(n)}],
\]
with Lax matrix \(M^{(n)}\)

\[
M^{(n)}(u, \Phi_1, \Phi_2, \lambda) = \left(\begin{array}{cc}
A^{(n)} & B^{(n)} \\
C^{(n)} & -A^{(n)}
\end{array}\right) = V^{(n)} + M_0
\]

\[
M_0 = \alpha \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \begin{pmatrix}
\phi_{1j}\phi_{2j} & -\phi_{1j}^2 \\
\phi_{2j}^2 & -\phi_{1j}\phi_{2j}
\end{pmatrix},
\]

and the Lax pair for (2.4)

\[
\psi_x = U(u, \lambda)\psi,
\]

\[
M^{(n)}(u, \Phi_1, \Phi_2, \lambda)\psi = \mu\psi.
\]

The spectral curve \(\Gamma\),

\[
\Gamma : \det(M^{(n)}(u, \Phi_1, \Phi_2, \lambda) - \mu) = 0
\]

is

\[
\mu^2 = (A^{(n)})^2(\lambda) + B^{(n)}(\lambda)C^{(n)}(\lambda).
\]

We present the first three high-order constrained flows as follows.
(1) For \(n = 0, \alpha = \frac{1}{2}\), (2.4\textbf{a}) gives an explicit constraint

\[
q = -\frac{1}{2} < \Phi_1, \Phi_1 >, \quad r = \frac{1}{2} < \Phi_2, \Phi_2 >.
\]

Then (2.4\textbf{a}) becomes a finite-dimensional integrable Hamiltonian system (FDIHS)

\[
\Phi_{1,x} = \frac{\partial \tilde{H}_0}{\partial \Phi_2}, \quad \Phi_{2,x} = -\frac{\partial \tilde{H}_0}{\partial \Phi_1},
\]

\[
\tilde{H}_0 = - < \Lambda \Phi_1, \Phi_2 > - \frac{1}{4} < \Phi_1, \Phi_1 > < \Phi_2, \Phi_2 >,
\]

with Lax matrix \(M^{(0)}\)

\[
A^{(0)} = -1 + \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{1j}\phi_{2j}; \quad B^{(0)} = -\frac{1}{2} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{1j}^2;
\]
\[ C^{(0)} = \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{2j}^2. \]  

(2.12)

The spectral curve \( \Gamma \) is a hyperelliptic, genus \( N - 1 \) curve

\[ \mu^2 = 1 + \sum_{j=1}^{N} \frac{P_j}{\lambda - \lambda_j}. \]  

(2.13)

with

\[ P_j = -\phi_{1j} \phi_{2j} + \frac{1}{4} \sum_{k \neq j} \frac{1}{\lambda_j - \lambda_k} (\phi_{1j} \phi_{2j} \phi_{1k} \phi_{2k} - \phi_{1k}^2 \phi_{2j}^2), \quad j = 1, \ldots, N. \]

\( P_1, \ldots, P_N \) are \( N \) independent integrals of motion in involution for FDIHS (2.11).

(2) For \( n = 1, \alpha = -\frac{1}{4}, \) (2.4) can be written as a FDIHS

\[ Q_x = \frac{\partial \tilde{H}_1}{\partial P}, \quad P_x = -\frac{\partial \tilde{H}_1}{\partial Q}, \]  

(2.14)

with

\[ \tilde{H}_1 = -\langle \Lambda \Phi_1, \Phi_2 \rangle - \frac{1}{2} r < \Phi_1, \Phi_1 > + \frac{1}{2} q < \Phi_2, \Phi_2 >, \]

\[ Q = (\phi_{11}, \ldots, \phi_{1N}, q)^T, \quad P = (\phi_{21}, \ldots, \phi_{2N}, r)^T, \]

and Lax matrix \( M^{(1)} \)

\[ A^{(1)} = -\lambda - \frac{1}{4} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{1j} \phi_{2j}, \quad B^{(1)} = q + \frac{1}{4} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{1j}^2, \]

\[ C^{(1)} = r - \frac{1}{4} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{2j}^2. \]  

(2.15)

The spectral curve \( \Gamma \) is

\[ \mu^2 = \lambda^2 + P_0 + \sum_{j=1}^{N} \frac{P_j}{\lambda - \lambda_j}, \]  

(2.16)

with

\[ P_0 = \frac{1}{2} \langle \Phi_1 \Phi_2 \rangle + qr, \]

\[ P_j = \frac{1}{4} (2 \lambda_j \phi_{1j} \phi_{2j} + r \phi_{1j}^2 - q \phi_{2j}^2) + \frac{1}{8} \sum_{k \neq j} \frac{1}{\lambda_j - \lambda_k} (\phi_{1j} \phi_{2j} \phi_{1k} \phi_{2k} - \phi_{1k}^2 \phi_{2j}^2). \]

\( P_0, \ldots, P_N \) are \( N + 1 \) independent integrals of motion in involution for FDIHS (2.14).
(3) For $n = 2$, $\alpha = \frac{1}{2}$, by introducing the following Jacobi-Ostrogradsky coordinates

$$Q = (\phi_{11}, ..., \phi_{1N}, q_1, q_2)^T, \quad P = (\phi_{21}, ..., \phi_{2N}, r_1, r_2)^T,$$

$$q_1 = q, \quad q_2 = r, \quad p_1 = -\frac{1}{4} r_x, \quad p_2 = -\frac{1}{4} q_x,$$

(2.4) can be transformed into a FDIHS

$$Q_x = \frac{\partial \tilde{H}_2}{\partial P}, \quad P_x = -\frac{\partial \tilde{H}_2}{\partial Q},$$

(2.17)

with

$$\tilde{H}_2 = -<\Lambda \Phi_1, \Phi_2> - \frac{1}{2} q_2 <\Phi_1, \Phi_1> + \frac{1}{2} q_1 <\Phi_2, \Phi_2> + \frac{1}{4} q_1^2 r_2^2 - 4 p_1 p_2,$$

and Lax matrix $M^{(2)}$

$$A^{(2)} = -\lambda^2 + \frac{1}{2} q_1 q_2 + \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{1j} \phi_{2j}, \quad B^{(2)} = q_1 \lambda + 2 p_2 - \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{1j}^2,$$

$$C^{(2)} = q_2 \lambda - 2 p_1 + \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\lambda - \lambda_j} \phi_{2j}^2.$$

(2.18)

The spectral curve $\Gamma$ is

$$\mu^2 = \lambda^4 + P_0 \lambda + P_{N+1} + \sum_{j=1}^{N} \frac{P_j}{\lambda - \lambda_j},$$

(2.19)

with

$$P_0 = -<\Phi_1 \Phi_2> - 2 q_1 p_1 + 2 p_2 q_2, \quad P_{N+1} = \tilde{H}_2,$$

$$P_j = \frac{1}{2}(-2 \lambda_j^2 \phi_{1j} \phi_{2j} - \lambda_j q_2 \phi_{1j}^2 + \lambda_j q_1 \phi_{2j}^2 + q_1 q_2 \phi_{1j} \phi_{2j}) + p_1 \phi_{1j}^2 + p_2 \phi_{2j}^2 + \frac{1}{2} \sum_{k \neq j} \frac{1}{\lambda_j - \lambda_k} (\phi_{1j} \phi_{2j} \phi_{1k} \phi_{2k} - \phi_{1k}^2 \phi_{2j}^2), \quad j = 1, ..., N.$$

$P_0, ..., P_{N+1}$ are $N + 2$ independent integrals of motion in involution for FDIHS (2.17).
3 One-point BTs for high-order constrained flows of the AKNS hierarchy

We first briefly review the Darboux transformations (DTs) for the AKNS hierarchy. Suppose that a gauge transformation

\[ \bar{\psi} = T\psi \]  

transforms (2.1) and (2.2) into

\[ \bar{\psi}_x = U(\bar{\psi}, \lambda) \bar{\psi}, \]  

\[ \bar{\psi}_{tn} = V^{(n)}(\bar{\psi}, \lambda). \]  

Let \( \psi(x, \eta_i) \) be a solution of (2.1) and (2.2) with \( \lambda = \eta_i, i = 1, 2, \eta_i \neq \lambda_j \). It is known [2, 16, 17, 18] that there are the following three kinds of the DTs for the AKNS hierarchy.

1. The first DT for the AKNS hierarchy is given by

\[ T_1 = \begin{pmatrix} \lambda - \eta_1 + \frac{1}{2} q f_1 & -\frac{1}{2} q \\ -f_1 & 1 \end{pmatrix}, \quad f_i = \frac{\psi_2(x, \eta_i)}{\psi_1(x, \eta_i)}, \]  

and

\[ \bar{q} = -\frac{1}{2} q_x - \eta_1 q + \frac{1}{2} q^2 f_1, \quad \bar{r} = 2 f_1, \]  

namely under the transformation (3.1) with (3.4), \( \bar{U} \) and \( \bar{V}^{(n)} \) are of the same form as \( U \) and \( V^{(n)} \) except for replacing \( q \) and \( r \) by \( \bar{q} \) and \( \bar{r} \). So (3.5) presents the relationship between two solutions \((q, r)\) and \((\bar{q}, \bar{r})\) of the equation (2.3).

2. The second DT for the AKNS hierarchy is given by

\[ T_2 = \begin{pmatrix} 1 & -f_2 \\ \frac{1}{2} r & \lambda - \eta_2 - \frac{1}{2} r f_2 \end{pmatrix}, \]  

and

\[ \bar{q} = -2 f_2, \quad \bar{r} = \frac{1}{2} r_x - \eta_2 r - \frac{1}{2} r^2 f_2. \]  

3. The third DT for the AKNS hierarchy is given by

\[ T_3 = \begin{pmatrix} \lambda - \eta_1 + m_2 & -m_1 \\ m_3 & \lambda - \eta_2 - m_2 \end{pmatrix}, \]
\( \bar{q} = q - 2m_1, \quad \bar{r} = r - 2m_3, \) (3.9)

with

\[
m_1 = \frac{(\eta_2 - \eta_1)\psi_1(\eta_1)\psi_1(\eta_2)}{\triangle}, \quad m_2 = \frac{(\eta_2 - \eta_1)\psi_1(\eta_2)\psi_2(\eta_1)}{\triangle},
\]

\[
m_3 = \frac{(\eta_2 - \eta_1)\psi_2(\eta_1)\psi_2(\eta_2)}{\triangle}, \quad \triangle = \psi_1(\eta_1)\psi_2(\eta_2) - \psi_2(\eta_1)\psi_1(\eta_2). \quad (3.10)
\]

We now consider the DTs for high-order constrained flows (2.4). Suppose that the gauge transformation (3.1) and accordingly

\[
\left( \bar{\phi}_{1j}, \bar{\phi}_{2j} \right) = \beta_j T \left( \phi_{1j}, \phi_{2j} \right), \quad (3.11)
\]

transforms (2.7) and (2.8) into

\[
\bar{\psi}_x = \overline{U}(\bar{u}, \lambda)\bar{\psi}, \quad (3.12)
\]

\[
\overline{M}^{(n)}(\bar{u}, \bar{\Phi}_1, \bar{\Phi}_2, \lambda)\bar{\psi} = \mu \bar{\psi}, \quad (3.13)
\]

where \( \overline{U} \) and \( \overline{M}^{(n)} \) satisfy

\[
T_x = \overline{U}(\bar{u}, \lambda)T - TU(u, \lambda), \quad (3.14)
\]

\[
\overline{M}^{(n)}(\bar{u}, \bar{\Phi}_1, \bar{\Phi}_2, \lambda)T = TM^{(n)}(u, \Phi_1, \Phi_2, \lambda). \quad (3.15)
\]

Motivated by the first DT for the AKNS hierarchy, let \( \psi(x, \eta_i) \) be a solution of (2.7) and (2.8) with \( \lambda = \eta_i, \mu = \mu_i, i = 1, 2, \eta_i \neq \lambda_j \). We find that the first DT for the constrained flows (2.4) consists of (3.1), (3.4), (3.5) and (3.11) with \( \beta_j = \frac{1}{\sqrt{\lambda_j - \eta_i}} \), namely

\[
\bar{\phi}_{1j} = \sqrt{\lambda_j - \eta_1}\phi_{1j} - \frac{1}{2\sqrt{\lambda_j - \eta_1}}q(\phi_{2j} - f_1\phi_{1j}), \quad (3.16a)
\]

\[
\bar{\phi}_{2j} = \frac{1}{\sqrt{\lambda_j - \eta_1}}(\phi_{2j} - f_1\phi_{1j}), \quad j = 1, ..., N. \quad (3.16b)
\]

In fact, based on the results of the DTs for the AKNS hierarchy, it can be shown by a similar way in [19, 20] that under the transformation (3.1), (3.4), (3.5) and (3.16), \( \overline{U} \)
and $\overline{M}^{(n)}$ permit the same form as $U$ and $M^{(n)}$ except for replacing $q,r,\phi_{1j}, \phi_{2j}$ by $\bar{q}, \bar{r}, \bar{\phi}_{1j}, \bar{\phi}_{2j}$, namely, we have

$$T_x = U(\bar{u}, \lambda)T - TU(u, \lambda),$$  \hspace{1cm} (3.17)

$$M^{(n)}(\bar{u}, \bar{\Phi}_1, \bar{\Phi}_2, \lambda)T = TM^{(n)}(u, \Phi_1, \Phi_2, \lambda).$$  \hspace{1cm} (3.18)

The equalities (3.17) and (3.18) ensure that (2.7) and (2.8) are invariant under the transformation (3.1), (3.4), (3.5) and (3.16). This guarantees that the relationship between $q, r, \phi_{1j}, \phi_{2j}$ and $\bar{q}, \bar{r}, \bar{\phi}_{1j}, \bar{\phi}_{2j}$ obtained from (3.17) and (3.18) is just the one between two solutions of the constrained flows (2.4). In fact, (3.17) and (3.18) give rises to (3.3) and (3.16) which present the relationship between two solutions of the constrained flows (2.4).

It follows from (2.8)

$$f_i = \frac{\mu_i - A^{(n)}(\eta_i)}{B^{(n)}(\eta_i)} = \frac{C^{(n)}(\eta_i)}{\mu_i + A^{(n)}(\eta_i)}, \quad i = 1, 2.$$  \hspace{1cm} (3.19)

By substituting (3.19) into (3.5) and (3.16), we obtain infinite number $(n = 0, 1, \ldots)$ of the first explicit one-point BT $B_n$ for the constrained flows (2.4) as follows

$$\bar{q} = -\frac{1}{2}q_x - \eta_1 q + \frac{1}{2}q^2 \frac{\mu_1 - A^{(n)}(\eta_1)}{B^{(n)}(\eta_1)}, \quad \bar{r} = 2\frac{\mu_1 - A^{(n)}(\eta_1)}{B^{(n)}(\eta_1)},$$  \hspace{1cm} (3.20a)

$$\bar{\phi}_{1j} = \sqrt{\lambda_j - \eta_1} \phi_{1j} - \frac{q}{2\sqrt{\lambda_j - \eta_1}}(\phi_{2j} - \frac{\mu_1 - A^{(n)}(\eta_1)}{B^{(n)}(\eta_1)} \phi_{1j}),$$  \hspace{1cm} (3.20b)

$$\bar{\phi}_{2j} = \frac{1}{\sqrt{\lambda_j - \eta_1}}(\phi_{2j} - \frac{\mu_1 - A^{(n)}(\eta_1)}{B^{(n)}(\eta_1)} \phi_{1j}).$$  \hspace{1cm} (3.20c)

It is found from (3.20a) and (3.18)

$$(\lambda - \eta_1) \overline{A}^{(n)}(\lambda) = (\lambda - \eta_1 + q f_1) A^{(n)}(\lambda) + f_1 (\lambda - \eta_1 + \frac{1}{2}q f_1) B^{(n)}(\lambda) - \frac{1}{2} q C^{(n)}(\lambda),$$  \hspace{1cm} (3.21a)

$$(\lambda - \eta_1) \overline{B}^{(n)}(\lambda) = q (\lambda - \eta_1 + \frac{1}{2} q f_1) A^{(n)}(\lambda) + (\lambda - \eta_1 + \frac{1}{2} q f_1)^2 B^{(n)}(\lambda) - \frac{1}{4} q^2 C^{(n)}(\lambda),$$  \hspace{1cm} (3.21b)

$$(\lambda - \eta_1) \overline{C}^{(n)}(\lambda) = -2 f_1 A^{(n)}(\lambda) - f_1^2 B^{(n)}(\lambda) + C^{(n)}(\lambda),$$  \hspace{1cm} (3.21c)
which, as we mentioned above, present the relationship between two solutions of the constrained flows (2.4).

Using the first three constrained flows as model, we now show the BTs (3.20) to be canonical transformations by presenting their generating functions and check spectrality property with respect to the Bäcklund parameter \( \eta \) and the ‘conjugated’ variable \( \mu \) with the point \((\eta, \mu)\) belonging to the spectral curve (2.9).

(1) For the first constrained flow, the FDIHS (2.11), using (2.12) and comparing the coefficients of \( \lambda^0 \) in (3.21c), one gets

\[
f_1 = \frac{1}{4} < \Phi_2, \Phi_2 > .
\]

Then we have from (3.16)

\[
\phi_{2j} = \sqrt{\lambda_j - \eta_1} \phi_{2j} + \frac{1}{4} < \Phi_2, \Phi_2 > \phi_{1j} = \frac{\partial S^{(0)}}{\partial \phi_{1j}},
\]

(3.23a)

\[
\overline{\phi}_{1j} = \sqrt{\lambda_j - \eta_1} \phi_{1j} + \frac{1}{4} < \Phi_1, \Phi_1 > \phi_{2j} = \frac{\partial S^{(0)}}{\partial \phi_{2j}},
\]

(3.23b)

where the generating function \( S^{(0)} \) for the canonical transformation (3.20) is given by

\[
S^{(0)} = \frac{1}{8} < \Phi_1, \Phi_1 > < \Phi_2, \Phi_2 > + \sum_{j=1}^{N} \sqrt{\lambda_j - \eta_1} \phi_{1j} \phi_{2j} - \eta_1.
\]

(3.24)

Furthermore, it is found from (2.12) and (3.16)

\[
\frac{\partial S^{(0)}}{\partial \eta_1} = -1 - \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\sqrt{\lambda_j - \eta_1}} \phi_{1j} \phi_{2j}
\]

\[
= -1 - \frac{1}{2} \sum_{j=1}^{N} \frac{1}{\sqrt{\lambda_j - \eta_1}} \phi_{1j} \frac{1}{\sqrt{\lambda_j - \eta_1}} [\phi_{2j} - f_1 \phi_{1j}] = A^{(0)}(\eta_1) + f_1 B^{(0)}(\eta_1) = \mu_1,
\]

(3.25)

which implies that \((\eta_1, \mu_1)\) satisfies the spectrality property. Consider the composition \( B_{\eta_1...\eta_N} = B_{\eta_1} \circ ... \circ B_{\eta_N} \) of the Bäcklund transformation \( B_{\eta_i} \). Then the corresponding generating function \( S_{\eta_1...\eta_N}^{(0)} \) becomes the generating function of the canonical transformation from \((\Phi_1, \Phi_2)\) to \((\eta, \mu)\) given by the equations

\[
\phi_{2j} = \frac{\partial S_{\eta_1...\eta_N}^{(0)}}{\partial \phi_{1j}}, \quad \mu_j = \frac{\partial S_{\eta_1...\eta_N}^{(0)}}{\partial \eta_j}.
\]
The points \((\eta_i, \mu_i)\) satisfy the separation equations given by the spectral curve (2.13)

\[
\mu_i^2 = 1 + \sum_{j=1}^{N} \frac{P_j}{\eta_i - \lambda_j}, \quad i = 1, \ldots, N.
\]

(2) For the second constrained flow, the FDIHS (2.14), using (2.15) and comparing the coefficients of \(\lambda, \lambda^0\) in (3.21c) and coefficient of \(\lambda\) in (3.21b), one gets \(f_1 = \frac{1}{2} \bar{r}\) and

\[
r = -\frac{1}{4} < \Phi_2, \Phi_2 > - \eta_1 \bar{r} + \frac{1}{4} q \bar{r}^2 = \frac{\partial S^{(1)}}{\partial q}, \quad (3.26)
\]

\[
\bar{q} = \frac{1}{4} < \Phi_1, \Phi_1 > - \eta_1 q + \frac{1}{4} q^2 \bar{r} = \frac{\partial S^{(1)}}{\partial \bar{r}}, \quad (3.27)
\]

then using (3.16)

\[
\phi_{2j} = \sqrt{\lambda_j - \eta_1 \bar{\phi}_{2j}} + \frac{1}{2} \bar{r} \phi_{1j} = \frac{\partial S^{(1)}}{\partial \phi_{1j}},
\]

\[
\bar{\phi}_{1j} = \sqrt{\lambda_j - \eta_1 \phi_{1j}} - \frac{1}{2} q \phi_{2j} = \frac{\partial S^{(1)}}{\partial \phi_{2j}}, \quad (3.28a)
\]

where the generating function \(S^{(1)}\) for the canonical transformation (3.20) is given by

\[
S^{(1)} = \frac{1}{4} \bar{r} < \Phi_1, \Phi_1 > - \frac{1}{4} q < \Phi_2, \Phi_2 > - \eta_1 q \bar{r} + \frac{1}{8} q^2 \bar{r}^2 + \sum_{j=1}^{N} \sqrt{\lambda_j - \eta_1 \phi_{1j} \phi_{2j}} + \eta_1^2.
\]

(3.29)

Furthermore, it is easy to check the spectrality property by means of (3.16) and (2.15)

\[
\frac{\partial S^{(1)}}{\partial \eta_1} = -\frac{1}{2} \sum_{j=1}^{N} \frac{1}{\sqrt{\lambda_j - \eta_1}} \phi_{1j} \phi_{2j} - q \bar{r} + 2 \eta_1
\]

\[
= -2[A^{(1)}(\eta_1) + f_1 B^{(1)}(\eta_1)] = -2 \mu_1.
\]

(3.30)

The point \((\eta_1, \mu_1)\) satisfies the separation equation given by the spectral curve (2.16)

\[
\mu_1^2 = \eta_1^2 + P_0 + \sum_{j=1}^{N} \frac{P_j}{\eta_1 - \lambda_j}.
\]
For the third constrained flow, the FDIHS (2.17), using (2.18), (3.16) and (3.21) in the same way as for (3.28), one gets \( f_1 = \frac{1}{2} \bar{q}_2 \) and

\[
\phi_{2j} = \sqrt{\lambda_j - \eta_1 \phi_{1j}} + \frac{1}{2} \bar{q}_2 \phi_{1j} = \frac{\partial S^{(2)}}{\partial \phi_{1j}}, \quad (3.31a)
\]

\[
\bar{\phi}_{1j} = \sqrt{\lambda_j - \eta_1 \phi_{1j}} - \frac{1}{2} q_1 \phi_{2j} = \frac{\partial S^{(2)}}{\partial \phi_{2j}}, \quad (3.31b)
\]

\[
\bar{\phi}_1 = \frac{1}{4} q_1^2 - \eta_1 \bar{q}_1 + 2 p_2 = \frac{\partial S^{(2)}}{\partial \bar{p}_1}, \quad (3.31c)
\]

\[
q_2 = \frac{1}{4} q_1 \bar{q}_2 - \eta_1 \bar{q}_2 - 2 \bar{p}_1 = - \frac{\partial S^{(2)}}{\partial \bar{p}_2}, \quad (3.31d)
\]

then \( p_1 = -\frac{1}{4} q_{1x} \) and \( \bar{p}_2 = -\frac{1}{4} \bar{q}_{1x} \) lead

\[
p_1 = -\frac{1}{4} \langle \Phi_2, \bar{q}_2 \rangle - \eta_1 \bar{p}_1 + \frac{1}{2} q_1 \bar{q}_2 \bar{p}_1 - \frac{1}{16} q_1^2 q_2^3 + \frac{1}{4} q_1 q_2 \eta_1 - \frac{1}{4} q_2 p_2 = \frac{\partial S^{(2)}}{\partial q_1}, \quad (3.31e)
\]

\[
\bar{p}_2 = -\frac{1}{4} < \Phi_1, \Phi_1 > - \eta_1 p_2 + \frac{1}{2} q_1 \bar{q}_2 p_2 + \frac{1}{16} q_1^3 \bar{q}_2^2 - \frac{1}{4} q_1 \bar{q}_2 \eta_1 - \frac{1}{4} q_1 p_2 = - \frac{\partial S^{(2)}}{\partial q_2}, \quad (3.31f)
\]

where the generating function \( S^{(2)} \) for the canonical transformation (3.20) is given by

\[
S^{(2)} = \frac{1}{4} \bar{q}_2 < \Phi_1, \Phi_1 > -\frac{1}{4} q_1 < \Phi_2, \bar{q}_2 > - \eta_1 q_1 \bar{p}_1 + \eta_1 \bar{q}_2 p_2 - \frac{1}{4} q_1 \bar{q}_2^2 p_2
\]

\[
+ 2 \bar{p}_1 p_2 + \frac{1}{4} q_1^2 \bar{q}_2 \bar{p}_1 + \frac{1}{8} q_1^2 \bar{q}_2 \eta_1 - \frac{1}{48} q_1^3 \bar{q}_2^3 + \sum_{j=1}^{N} \sqrt{\lambda_j - \eta_1 \phi_{1j}} \bar{\phi}_{2j} - \frac{1}{3} \eta_1^3. \quad (3.32)
\]

Then it is easy to check the spectrality

\[
\frac{\partial S^{(2)}}{\partial \eta_1} = \frac{1}{2} \sum_{j=1}^{N} \phi_{1j} \int \phi_{2j} - \frac{1}{2} \bar{q}_2 \phi_{1j} + \bar{q}_2 p_2
\]

\[
+ \frac{1}{2} q_1 [q_2 - \frac{1}{4} q_1 \bar{q}_2 + \bar{q}_2 \eta_1] + \frac{1}{8} q_1^2 \bar{q}_2^2 = A^{(2)}(\eta_1) + f_1 B^{(2)}(\eta_1) = \mu_1. \quad (3.33)
\]
The point \((\eta_1, \mu_1)\) satisfies the separation equation given by the spectral curve (2.19)

\[
\mu_1^2 = \eta_1^4 + P_0\eta_1 + P_{N+1} + \sum_{j=1}^{N} \frac{P_j}{\eta_1 - \lambda_j}.
\]

In the exactly same way, we can find second one-point BTs for the constrained flows (2.4) according to the second DTs for the AKNS hierarchy. By composition of these two BTs, we can find two-point BTs for the constrained flows (2.4). Since these two-point BTs are quite complicated, we will present another two-point BTs for the constrained flows in the next section.

4 Two-point BTs for high-order constrained flows of the AKNS hierarchy

Let \(\psi(x, \eta_i)\) be a solution of (2.7) and (2.8) with \(\lambda = \eta_i, \mu = \mu_i, i = 1, 2, \eta_i \neq \lambda_j\).

Motivated by the third DT for the AKNS hierarchy, we obtain the third DT for the constrained flows (2.4) consisting of (3.1), (3.8) and

\[
\bar{q} = q - 2m_1, \quad \bar{r} = r - 2m_3,
\]

(4.1a)

\[
\bar{\phi}_{1j} = \frac{1}{\sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)}}[(\lambda_j - \eta_1 + m_2)\phi_{1j} - m_1\phi_{2j}],
\]

(4.1b)

\[
\bar{\phi}_{2j} = \frac{1}{\sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)}}[m_3\phi_{1j} + (\lambda_j - \eta_2 - m_2)\phi_{2j}].
\]

(4.1c)

It follows from (3.10) and (3.19)

\[
m_1 = \frac{(\eta_2 - \eta_1) B^{(n)}(\eta_1) B^{(n)}(\eta_2)}{(\mu_2 - A^{(n)}(\eta_2)) B^{(n)}(\eta_1) - (\mu_1 - A^{(n)}(\eta_1)) B^{(n)}(\eta_2)},
\]

(4.2a)

\[
m_2 = \frac{(\eta_2 - \eta_1)(\mu_1 - A^{(n)}(\eta_1))(\mu_2 - A^{(n)}(\eta_2))}{(\mu_2 - A^{(n)}(\eta_2)) B^{(n)}(\eta_1) - (\mu_1 - A^{(n)}(\eta_1)) B^{(n)}(\eta_2)},
\]

(4.2b)

\[
m_3 = \frac{(\eta_2 - \eta_1)(\mu_1 - A^{(n)}(\eta_1)) B^{(n)}(\eta_2)}{(\mu_2 - A^{(n)}(\eta_2)) B^{(n)}(\eta_1) - (\mu_1 - A^{(n)}(\eta_1)) B^{(n)}(\eta_2)}.
\]

(4.2c)
By substituting (4.2), (4.1) gives rise to infinite number \((n = 0, 1, \ldots)\) of explicit two-point BT for the constrained flows (2.4). We now show that the two-point BTs (4.1) are canonical transformations and possess the spectrality property. It is easy to check that
\[
m_2^2 + (\eta_2 - \eta_1) m_2 - m_1 m_3 = 0,
\]
\[
f_1 = \frac{m_2}{m_1}, \quad f_2 = \frac{m_2 + m_2 - m}{m_1}. \tag{4.3}
\]
Using (4.3), (4.1b) and (4.1c) can be rewritten as
\[
\phi_{2j} = \frac{1}{m_1} \left( (\lambda_j - \eta_1 + m_2) \phi_{1j} - \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \tilde{\phi}_{1j} \right), \tag{4.4a}
\]
\[
\tilde{\phi}_{2j} = \frac{1}{m_1} \left[ \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \phi_{1j} + (\lambda_j + \eta_2 + m_2) \tilde{\phi}_{1j} \right]. \tag{4.4b}
\]
The formulas (3.8), (3.15) and (4.3) lead to
\[
[\lambda^2 - \lambda(\eta_1 + \eta_2) + \eta_1 \eta_2] \overline{A}^{(n)}(\lambda) = [\lambda^2 - \lambda(\eta_1 + \eta_2) + \eta_1 \eta_2 - 2m_1 m_3] A^{(n)}(\lambda)
\]
\[-m_3[\lambda - \eta_1 + m_2] B^{(n)}(\lambda) - m_1[\lambda - \eta_2 - m_2] C^{(n)}(\lambda), \tag{4.5a}\]
\[
[\lambda^2 - \lambda(\eta_1 + \eta_2) + \eta_1 \eta_2] \overline{B}^{(n)}(\lambda) = 2m_1[\lambda - \eta_1 + m_2] A^{(n)}(\lambda)
\]
\[+ [\lambda - \eta_1 + m_2]^2 B^{(n)}(\lambda) - m_1^2 C^{(n)}(\lambda), \tag{4.5b}\]
\[
[\lambda^2 - \lambda(\eta_1 + \eta_2) + \eta_1 \eta_2] \overline{C}^{(n)}(\lambda) = 2m_3[\lambda - \eta_2 - m_2] A^{(n)}(\lambda)
\]
\[-m_3^2 B^{(n)}(\lambda) + [\lambda - \eta_2 - m_2]^2 C^{(n)}(\lambda). \tag{4.5c}\]

(1) For the first constrained flow, the FDIHS (2.11), using (4.3) and (4.5), one gets
\[
m_1 = \frac{1}{4} \left< \Phi_1, \Phi_1 \right> - \frac{1}{4} \left< \Phi_1, \Phi_1 \right>,
\]
\[
m_2 = \frac{1}{\left< \Phi_1, \Phi_1 \right> - \left< \Phi_1, \Phi_1 \right>} \left< \Delta \Phi_1, \Phi_1 \right> + \left< \Lambda \Phi_1, \Phi_1 \right>
\]
\[-\eta_2 \left< \Phi_1, \Phi_1 \right> - \eta_1 \left< \Phi_1, \Phi_1 \right> - 2 \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \phi_{1j} \bar{\phi}_{1j}. \tag{4.6}\]
Then substituting (4.6) into (4.4) gives rise to
\[
\phi_{2j} = \frac{\partial S^{(0)}}{\partial \phi_{1j}}, \quad \bar{\phi}_{2j} = -\frac{\partial S^{(0)}}{\partial \phi_{1j}}, \quad j = 1, \ldots, N, \tag{4.7}
\]
where the generating function \(S^{(0)}\) for the canonical transformation (4.1) is given by
\[
S^{(0)} = \frac{2}{\langle \Phi_1, \Phi_1 \rangle - \langle \Phi_1, \Phi_1 \rangle} \left[ \langle \Lambda \Phi_1, \Phi_1 \rangle + \langle \Lambda \Phi_1, \Phi_1 \rangle - \eta_2 \langle \Phi_1, \Phi_1 \rangle \right]
- \eta_1 \langle \Phi_1, \Phi_1 \rangle - 2 \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \phi_{1j} \bar{\phi}_{1j} - \eta_1 - \eta_2. \tag{4.8}
\]
Furthermore, it is found
\[
\frac{\partial S^{(0)}}{\partial \eta_1} = -1 + \frac{2}{\langle \Phi_1, \Phi_1 \rangle - \langle \Phi_1, \Phi_1 \rangle} \left[ - \langle \Phi_1, \Phi_1 \rangle + 2 \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_2)} \phi_{1j} \bar{\phi}_{1j} \right]
= A^{(0)}(\eta_1) + f_1 B^{(0)}(\eta_1) = \mu_1, \tag{4.9a}
\]
\[
\frac{\partial S^{(0)}}{\partial \eta_2} = A^{(0)}(\eta_2) + f_2 B^{(0)}(\eta_2) = \mu_2. \tag{4.9b}
\]
This implies that \((\eta_1, \mu_1)\) and \((\eta_2, \mu_2)\) satisfy the spectrality property and the separation equations given by the spectral curve (2.13)
\[
\mu_i^2 = 1 + \sum_{j=1}^{N} \frac{P_j}{\eta_i - \lambda_j}, \quad i = 1, 2.
\]
(2) For the second constrained flow, the FDIHS (2.14), formula (4.5) gives rise to
\[
m_1 = \frac{1}{2}(q - \bar{q}),
\]
\[
m_2 = \frac{1}{q + \bar{q}} \left[ \frac{1}{4} \langle \Phi_1, \Phi_1 \rangle - \frac{1}{4} \langle \Phi_1, \Phi_1 \rangle + \eta_1 q - \eta_2 \bar{q} \right], \tag{4.10}
\]
and
\[
r = \frac{4}{(q - \bar{q})^2} \left[ \frac{1}{4} \langle \Lambda \Phi_1, \Phi_1 \rangle - \frac{1}{4} \langle \Lambda \Phi_1, \Phi_1 \rangle + \frac{1}{4} (\eta_1 + \eta_2) \langle \Phi_1, \Phi_1 \rangle \right].
\]
\[-\eta_1 \eta_2 \bar{q} + (m_2 - \eta_1)^2 q + \frac{1}{2} \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \phi_{1j} \bar{\phi}_{1j}, \quad (4.11a)\]

\[\bar{r} = -2 \frac{m_2}{m_1} (m_2 + \eta_2 - \eta_1) + r. \quad (4.11b)\]

By substitution of (4.10), (4.4) and (4.11) can be rewritten as

\[\phi_{2j} = \frac{\partial S^{(1)}}{\partial \phi_{1j}}, \quad \bar{\phi}_{2j} = -\frac{\partial S^{(1)}}{\partial \bar{\phi}_{1j}}, \quad r = \frac{\partial S^{(1)}}{\partial \bar{q}}, \quad \bar{r} = -\frac{\partial S^{(1)}}{\partial q}, \quad (4.12)\]

where the generating function \(S^{(1)}\) for the canonical transformation (4.1) is given by

\[S^{(1)} = \frac{1}{q - \bar{q}} [\Lambda \Phi_i, \Phi_1] + \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \phi_{1j} \bar{\phi}_{1j}\]

\[+ \frac{1}{2} \left( \frac{1}{q^2 - \bar{q}^2} \right) \left( \frac{1}{4} < \Phi_i, \Phi_1 > - \frac{1}{8} < \Phi_1, \Phi_1 >^2 - \frac{1}{8} < \Phi_1, \Phi_1 >^2 + 4\eta_1 \eta_2 q \bar{q} - 2(\eta_1^2 + \eta_2^2) \bar{q}^2 \right) - \eta_1^2 - \eta_2^2. \quad (4.13)\]

It is easy to check the spectrality property

\[\frac{\partial S^{(1)}}{\partial \eta_1} = \frac{1}{q - \bar{q}} [-q < \Phi_i, \Phi_1 > - \bar{q} < \Phi_1, \Phi_1 > - 4\eta_1 \bar{q}^2 + 4\eta_2 q \bar{q}] - 2\eta_1\]

\[+ \frac{1}{q - \bar{q}} \sum_{j=1}^{N} \sqrt{\lambda_j - \eta_2} \phi_{1j} \bar{\phi}_{1j} = -2[A^{(1)}(\eta_1) + f_1 B^{(1)}(\eta_1)] = -2\mu_1, \quad (4.14a)\]

\[\frac{\partial S^{(1)}}{\partial \eta_2} = -2[A^{(1)}(\eta_2) + f_2 B^{(1)}(\eta_2)] = -2\mu_2. \quad (4.14b)\]

The points \((\eta_i, \mu_i)\) satisfy the separation equations given by the spectral curve (2.10)

\[\mu_i^2 = \eta_i^2 + P_0 + \sum_{j=1}^{N} \frac{P_j}{\eta_i - \lambda_j}, \quad i = 1, 2.\]

(3) For the third constrained flow, the FDIHS (2.17), by means of (4.3) and (4.5), one gets

\[m_1 = \frac{1}{2}(q_1 - \bar{q}_1), \quad m_3 = \frac{1}{2}(q_2 - \bar{q}_2),\]
\[ m_2 = \frac{1}{2} (\eta_1 - \eta_2) + \frac{1}{2} \sqrt{(\eta_1 - \eta_2)^2 + (q_1 - q_1)(q_2 - q_2)}, \] (4.15)

and

\[ p_1 = \frac{2}{(q_1 - q_1)^2} \left\{ -\frac{1}{2} < \Lambda \Phi_1, \Phi_1 > - \frac{1}{2} < \Lambda \Phi_1, \Phi_1 > + \frac{1}{2} (\eta_1 + \eta_2) < \Phi_1, \Phi_1 > - m_1 (m_2 - \eta_1)^2 q_1 q_2 + (m_2 - \eta_1)^2 (m_2 q_1 + m_2 q_1 + \eta_2 q_1 - \eta_1 q_1) \right\} + \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)} \phi_{1j} \phi_{1j} \]

\[ + \frac{\eta_1 \eta_2 - (m_2 - \eta_1)^2}{\sqrt{(\eta_1 - \eta_2)^2 + (q_1 - q_1)(q_2 - q_2)}} \left\{ -\frac{1}{2} < \Phi_1, \Phi_1 > + \frac{1}{2} < \Phi_1, \Phi_1 > - \frac{1}{4} q_2 (q_1^2 - q_1^2) + (m_2 - \eta_1)^2 (q_1 + 2q_1) + 2(m_2 - \eta_1)(\eta_1 + \eta_2) q_1 + \eta_1 \eta_2 q_1 \right\}, \] (4.16a)

\[ p_1 = p_1 + \frac{1}{2} (m_2 + \eta_2)(q_2 + q_2) - \frac{1}{2} (\eta_1 + \eta_2) q_2, \] (4.16b)

\[ \bar{p}_2 = \frac{1}{2} \left\{ -\frac{1}{2} < \Phi_1, \Phi_1 > + \frac{1}{2} < \Phi_1, \Phi_1 > - \frac{1}{4} q_2 (q_1^2 - q_1^2) + (m_2 - \eta_1)^2 (q_1 + 2q_1) + 2(m_2 - \eta_1)(\eta_1 + \eta_2) q_1 + \eta_1 \eta_2 q_1 \right\}, \] (4.16c)

\[ p_2 = \bar{p}_2 + \frac{1}{2} (\eta_1 + \eta_2) q_1 - \frac{1}{2} (m_2 + \eta_2)(q_1 + q_1). \] (4.16d)

By inserting (4.13) into (4.4) and (4.16), a straightforward calculation leads to

\[ \phi_{2j} = \frac{\partial S^{(2)}}{\partial \phi_{1j}}, \quad \bar{\phi}_{2j} = - \frac{\partial S^{(2)}}{\partial \phi_{1j}}, \quad p_1 = \frac{\partial S^{(2)}}{\partial q_1}, \]

\[ p_2 = \frac{\partial S^{(2)}}{\partial q_2}, \quad \bar{p}_1 = - \frac{\partial S^{(2)}}{\partial \bar{q}_1}, \quad \bar{p}_2 = - \frac{\partial S^{(2)}}{\partial \bar{q}_2}, \] (4.17)

where the generating function \( S^{(2)} \) for the canonical transformation (4.1) is given by

\[ S^{(2)} = \frac{1}{q_1 - q_1} < \Lambda \Phi_1, \Phi_1 > + \frac{1}{2} (\eta_1 + \eta_2)(\Phi_1, \Phi_1 > + < \Phi_1, \Phi_1 > + \frac{2}{3} (m_2 - \eta_1)^3 (q_1 + 2q_1) + 2(m_2 - \eta_1)^2 (\eta_1 + \eta_2) q_1 - (\eta_1 + \eta_2) \eta_1 \eta_2 q_1. \]
\[ \frac{1}{2} \sqrt{(\eta_1 - \eta_2)^2 + (q_1 - \bar{q}_1)(q_2 - \bar{q}_2)} < \Phi_1, \Phi_1 > - < \bar{\Phi}_1, \bar{\Phi}_1 > + 2 \eta_1 \eta_2 \bar{q}_1 \]

\[ -2 \sum_{j=1}^{N} \sqrt{(\lambda_j - \eta_1)(\lambda_j - \eta_2)\phi_{ij}\phi_{ij}} + \frac{1}{4}(\eta_1 + \eta_2)(q_1 - \bar{q}_1)q_2 \]

\[ -\frac{1}{4} \sqrt{(\eta_1 - \eta_2)^2 + (q_1 - \bar{q}_1)(q_2 - \bar{q}_2)q_2(q_1 - \bar{q}_1)q_2} + \frac{1}{3}(\eta_1^2 + \eta_2^2). \quad (4.18) \]

By a straightforward calculation, we can show the spectrality property

\[ \frac{\partial S^{(2)}}{\partial \eta_1} = A^{(2)}(\eta_1) + f_1 B^{(2)}(\eta_1) = \mu_1, \quad \frac{\partial S^{(2)}}{\partial \eta_2} = A^{(2)}(\eta_2) + f_2 B^{(2)}(\eta_2) = \mu_2. \quad (4.19) \]

The points \((\eta, \mu_i)\) satisfy the separation equations given by the spectral curve \((2.13)\)

\[ \mu_i^2 = \eta_i^4 + P_0 \eta_i + P_{N+1} + \sum_{j=1}^{N} \frac{P_j}{\eta_i - \lambda_j}, \quad i = 1, 2. \]

5 m-times repeated two-point DTs for high-order constrained flows of the AKNS hierarchy

Assume that \((\psi_1(x, \eta), \psi_2(x, \eta))^T, i = 1, ..., 2m,\) be solutions of \((2.7)\) and \((2.8)\) with \(\lambda = \eta_i, \mu = \mu_i, i = 1, 2, ..., 2m, \eta_i \neq \lambda_j.\) We use \(q[l], r[l], \phi_{ij}[l], \phi_{2j}[l]\) to denote the action of \(l\)-times repeated two-point DTs of \((4.1)\) on the initial solution \(q[0], r[0], \phi_{ij[0]}, \phi_{2j[0]}\). We have according to \((4.1)\)

\[ q[l + 1] = q[l] - 2m_1[l], \quad r[l + 1] = r[l] - 2m_3[l], \quad (5.1a) \]

\[ \phi_{1j}[l + 1] = \frac{1}{\sqrt{(\lambda_j - \eta_{2l+1})(\lambda_j - \eta_{2l+2})}}[\phi_{1j}[l] - \phi_{2j}[l]], \quad \phi_{2j}[l + 1] = \frac{1}{\sqrt{(\lambda_j - \eta_{2l+1})(\lambda_j - \eta_{2l+2})}}[m_3[l]\phi_{1j}[l] + \phi_{2j}[l]]. \quad (5.1c) \]

We denote

\[ G_m = \begin{pmatrix}
\eta_1^m \psi_1(\eta_1) & \eta_2^m \psi_1(\eta_2) & \eta_3^m \psi_1(\eta_3) & \cdots & \eta_{2m}^m \psi_1(\eta_{2m}) \\
\eta_1^{m-1} \psi_1(\eta_1) & \eta_2^{m-1} \psi_1(\eta_2) & \eta_3^{m-1} \psi_1(\eta_3) & \cdots & \eta_{2m}^{m-1} \psi_1(\eta_{2m}) \\
\cdots & \cdots & \cdots & \cdots & \cdots \\
\psi_1(\eta_1) & \psi_1(\eta_2) & \psi_1(\eta_3) & \cdots & \psi_1(\eta_{2m}) \\
\eta_1^{m-2} \psi_2(\eta_1) & \eta_2^{m-2} \psi_2(\eta_2) & \eta_3^{m-2} \psi_2(\eta_3) & \cdots & \eta_{2m}^{m-2} \psi_2(\eta_{2m}) \\
\cdots & \cdots & \cdots & \cdots & \cdots \\
\psi_2(\eta_1) & \psi_2(\eta_2) & \psi_2(\eta_3) & \cdots & \psi_2(\eta_{2m})
\end{pmatrix}, \]
\[
\Delta_m = \begin{pmatrix}
\eta_1^{m-1} \psi_1(\eta_1) & \eta_2^{m-1} \psi_1(\eta_2) & \eta_3^{m-1} \psi_1(\eta_3) & \ldots & \eta_{2m}^{m-1} \psi_1(\eta_{2m}) \\
\eta_1^{m-2} \psi_1(\eta_1) & \eta_2^{m-2} \psi_1(\eta_2) & \eta_3^{m-2} \psi_1(\eta_3) & \ldots & \eta_{2m}^{m-2} \psi_1(\eta_{2m}) \\
& \ldots & \ldots & \ldots & \ldots \\
\eta_1^{m-1} \psi_2(\eta_1) & \eta_2^{m-1} \psi_2(\eta_2) & \eta_3^{m-1} \psi_2(\eta_3) & \ldots & \eta_{2m}^{m-1} \psi_2(\eta_{2m}) \\
\eta_1 \psi_1(\eta_1) & \eta_2 \psi_1(\eta_2) & \eta_3 \psi_1(\eta_3) & \ldots & \eta_{2m} \psi_1(\eta_{2m}) \\
\eta_1 \psi_2(\eta_1) & \eta_2 \psi_2(\eta_2) & \eta_3 \psi_2(\eta_3) & \ldots & \eta_{2m} \psi_2(\eta_{2m}) \\
\end{pmatrix},
\]

\[
W_m(j) = \begin{pmatrix}
\lambda_j^m \phi_{1j}[0] & \eta_1^m \psi_1(\eta_1) & \eta_2^m \psi_1(\eta_2) & \ldots & \eta_{2m}^m \psi_1(\eta_{2m}) \\
\lambda_j^{m-1} \phi_{1j}[0] & \eta_1^{m-1} \psi_1(\eta_1) & \eta_2^{m-1} \psi_1(\eta_2) & \ldots & \eta_{2m}^{m-1} \psi_1(\eta_{2m}) \\
& \ldots & \ldots & \ldots & \ldots \\
\lambda_j^{m-1} \phi_{2j}[0] & \eta_1^{m-1} \psi_2(\eta_1) & \eta_2^{m-1} \psi_2(\eta_2) & \ldots & \eta_{2m}^{m-1} \psi_2(\eta_{2m}) \\
\phi_{1j}[0] & \eta_1 \psi_1(\eta_1) & \eta_2 \psi_1(\eta_2) & \ldots & \eta_{2m} \psi_1(\eta_{2m}) \\
\phi_{2j}[0] & \eta_1 \psi_2(\eta_1) & \eta_2 \psi_2(\eta_2) & \ldots & \eta_{2m} \psi_2(\eta_{2m}) \\
\end{pmatrix}.
\]

Then \(m\)-times repeated DTs for the constrained flows (2.4) are given by

\[
q[m] = q[0] - 2 \frac{G_m^*}{\Delta_m^*}, \quad r[m] = r[0] - 2 \frac{G_m^*}{\Delta_m^*}, \quad (5.2a)
\]

\[
\phi_{1j}[m] = \frac{1}{\sqrt{\prod_{i=1}^{2m}(\lambda_j - \eta_i)}} \frac{W_m(j)}{\Delta_m^*}, \quad \phi_{2j}[m] = \frac{1}{\sqrt{\prod_{i=1}^{2m}(\lambda_j - \eta_i)}} \frac{W_m^*(j)}{\Delta_m^*}, \quad (5.2b)
\]

where \(G_m^*, W_m^*(j)\) and \(\Delta_m^*\) are obtained by interchanging \(\psi_1(x, \eta_i)\) and \(\psi_2(x, \eta_i)\), \(i = 1, \ldots, 2m, \phi_{1j}(\lambda_j)\) and \(\phi_{2j}(\lambda_j)\) in \(G_m, W_m(j)\) and \(\Delta_m\), respectively. Formula (5.2a) was shown in [2, 10], (5.2b) can be obtained in the same way by using the formulas for Vandermonde-like determinants \(G_m^*, W_m^*(j)\) and \(\Delta_m^*\) given in [22].

6 Conclusion

Some methods were presented to construct the Bäcklund transformations with the properties described above in [2, 3, 8, 3, 14] for few examples. In this paper we propose a way to construct infinite number of explicit one- and two-point Bäcklund transformations for high-order constrained flows of soliton hierarchy by means of the Darboux transformations for the constrained flows by using the high-order constrained flows of the AKNS...
hierarchy as model. By constructing the generating functions, it is shown that these BTs are canonical transformations including Bäcklund parameter $\eta$ and a spectrality property holds with respect to the Bäcklund parameter $\eta$ and the conjugate variable $\mu$. The pair $(\eta, \mu)$ lies on the spectral curve and satisfies the separation equation. Also we present the formula for m-times repeated Darboux transformations for the high-order constrained flows of the AKNS hierarchy.

The method prososed in this paper can be applied to the high-order binary constrained flows of AKNS hierarchy in [23] to find new explicit BT’s with canonicity and spectrality.
