1. Introduction

Electronic human resource management concept has attracted discourse both in practice and academia. Organizations have recognized the importance of integrating information technology in their functions and operations. The term Electronic Human Resource Management (e-HRM) was coined in the 1990s and refers to conducting HRM activities with the use of the internet or the intranet (Lengnick-Hall & Moritz, 2003). Strohmeier (2007) defined e-HRM as the application of information technology for networking and supporting at least two individual or collective actors in performing HRM activities. Since the mid-1990s, organizations have increasingly embraced electronic human resource management under different names, for instance, electronic Human Resource Management (e-HRM), Digital Human Resource Management (D-HRM), Green Human Resource Management (e-HRM), or Web based Human Resource Management.

Online recruitment systems enable organizations to share important details about the positions available and also provide more specific information such as job descriptions, organization's culture or brand identity and job incentives (Stone and Lukaszewsky, 2013). The most common practices used for online recruitment involve adding recruitment pages to existing organization websites; Using specialized recruitment websites such as job portals, online job boards; developing interactive tools for processing applications; and using screening techniques (Galanaki, 2002). E-recruitment has been categorized into two: corporate web site for recruitment and commercial jobs boards (such as monster.com) for posting job advertisements. For corporate websites a company develops its own website with a link for job posting/career options where candidates can log into for current openings. For commercial job boards for recruitment, a company advertises its vacant positions on other website that specialize in recruitment. Institutions generally adopt a recruitment method that suits their size and budget for recruitment. Further, the size and nature of the fraction that applies for an organization's vacancies will be affected by how (and to whom) the organization communicates its vacancies (Parry and Wilson, 2009). Clarke, (2006) argued that while recruiting and hiring efforts are already a major component of the standard HR department's responsibilities, this area is naturally a great choice for wide-sweeping Electronicing.' Here,
HR departments do hiring and recruiting more of a workforce that is aware of, and personally more committed to electronic matters than the typical job candidate. By hiring those who are already aligned with e-friendly environment living in their own lives, the workforce is then populated by an easier group to work with toward the greater goals of departmental or even organization-wide electronicing (Clarke, 2006).

E-Recruitment allows storing great amounts of CVs online, which makes the process unconstrained by geographical locations. Online job advertising allows companies to open all the information regarding job to the applicants since the first contact (Ravinda and Pallavi, 2011). Electronic selection happens when during the process of selection to fill job vacancies, companies consider candidates “IT concern and interest” as selection criteria. Another strategy for electronic selection is when interviewing candidates or evaluating them for selection, IT information management related questions are asked by those companies selecting applicants who have been engaging in electronicing as consumers under their private life domain is yet another form of electronic selection (Opatha, 2013).

After short listing candidates based on application documents and CVs, HR officers can ensure that the next steps of the selection process will evaluate the candidates’ aptitude to have electronic behaviors. An ordinary question about use of IT in handling operations during an interview or a group dynamic that mixes a business case with sustainability issues are two easy ways to understand someone’s degree of IT awareness. In the end, electronic score can also be given to each candidate and added to the overall spreadsheet of scores that will ultimately rank the top candidates (Renwick et al, 2008).

According to Jackson et al, (2011), technology allows companies to become paperless and for HR this can well start with newcomers. Online portals and folders can be used to archive employees’ documentation such as offer-letters, credentials, CVs or recommendation letters. Not to mention that nowadays CVs are mostly sent throughout the internet, with no need of being print. It can as well be used with current employees’ health insurance or car contracts, salary or information on other benefits.

A survey of universities websites and web content Spatha analysis in Kenya indicates that all universities have established websites on which they display corporate information. The websites provide a platform on which advertising of vacant positions and giving information about positions in the establishment of the respective universities is uploaded for purposes of reaching out to the public, both local and international. Besides the websites, information gathered from the HROs of respective universities covered under this study indicates that the universities have adopted and engaged the Enterprise Resource Planning (ERP) software system to help them in managing some financial and administrative operations.

Universities have embraced online teaching of students, virtual training of staff, and circulation of training materials is done online. Other online platforms that have been used to enhance e-HRM practices include use of emails, WhatsApp, Facebook, twitter, LinkedIn as for instance use of email for official communication, WhatsApp, twitter, LinkedIn for communication and sharing e-resources. Virtual meeting platforms such as Google meet, Zoom, Webex, and Kenet have been adopted by universities to carry out online meetings and trainings.

The term 'Service Quality' is an association of two different words; ‘service’ and ‘quality’. Service means ‘any activity or benefit that one party can offer to another that is essentially intangible and does not result in the ownership of anything. Gefen (2002) defined service quality as the subjective comparison that customers make between the quality of service that they receive and the one they get. In another definition, Kalidas (2007) defined service quality as the ability of a service provider to satisfy a customer in an efficient manner through which he can better the performance of business.

Service quality has widely been discussed since 20th century and its idea is still relevant to help today organizations in creating differentiation and gaining competitive advantage in an era of borderless world and globalization (Ismail, et al. 2016). In a quality management literature, quality service delivery is often seen as a multi-dimensional construct as illustrated in the following research studies:

The seminal work on service quality by Parasuraman et al., (1985), identified ten dimensions of service quality from 97 items which were considered important in assessing customer’s expectations and perceptions on delivered service. The ten dimensions were; tangibles, reliability, responsiveness, communication, credibility, security, competence, courtesy, understanding, knowing, customers, and access. Later in 1991, Parasuraman and his associates through an empirical test developed five dimensions of service quality based on the ten dimensions he developed in 1985. Factor analysis on a data set of 22 attributes revealed five dimensions which include tangibles, reliability, responsiveness, assurance and empathy. Tangibles include aspects such as the physical facilities, equipment, and appearance of personnel. Reliability is the ability to perform the desired service dependably, accurately, and consistently while responsiveness is the willingness to provide prompt service and help customers. Assurance concerns employees’ knowledge, courtesy, and ability to convey trust and confidence to the customers while empathy entails the provision of caring, individualized attention to customers (Parasuraman et al., 1991). Stone, et al., (2006) observed that every organization has its own culture which affects its ability to compete and respond successfully to changes in the external environment. The changes in the external environment in turn determine if the organization will succeed or fail. On the other hand, Sole (2009) observed that there are two basic factors which influence performance management systems in public organization. These are internal and external factors. Internal factors include leadership and internal management commitment, internal resources, performance-oriented culture, employee engagement, and maturity of PMS. Leadership is important in designing relevant policies and documenting work procedures that would help in providing guidance and ensuring consistency in decision making. Sole (2009) observed that culture can be thought of as the sum total of beliefs, ideologies, behaviors and values prevalent in organizations, which can influence organization power relationship and their response to change. It could have a great impact on its success if the employees are involved and motivated during the development of the performance measurement and management system. Experience in performance management and measurement
systems will affect the system implementation and also its end results. This study finds out the relationship between electronic recruitment management, service quality and the Interaction role of organizational factors. A survey through documented literature reveals that public universities have adopted electronic recruitment practice (e-RP), however, there is limited documentation on the link between e-RP and quality service delivery. Evidence suggest contextual variations on service quality between public and private universities with no significant difference between research and non-research universities from student perspectives (Yusof et al., 2017; Owino 2014). However, studies focusing on service quality from multiple perspectives are scanty and therefore this study explored e-HRM and service quality from teaching staff, administrative staff and student perspectives.

Research on e-RP continue to report mixed results, with some studies reporting positive and significant results (Bondarouk e al, 2017), while other studies report non-significant results (Ruel et al, 2007). Chapman & Webster (2003) argue that e-RP has been found to achieve less than expected. Rather than e-RP freeing up time for human resource practitioners, it just shifted the same duties to online platforms (Gardner, Lepak, and Bartol 2003). In brief, e-RP did not improve HRM services. This view is consistent with Reddington & Hyde, (2008) who noted that e-RP results are not always as positive as commonly assumed. Other studies show that human resource professionals have been unsuccessful in using technology to initiate and support strategic decisions (Dery & Wailes, 2005), and therefore e-HRM technology is primarily used to simply support routine administrative human resource tasks and that, line managers reported contradictory results when using e-HRM (Haines & Lafluer, 2008; Hussain, Wallace, & Cornelius, 2007; Ball, 2001). Even though the e-RP concept is gaining acceptance today, there is still a missing link between the e-RP practices and quality service delivery in public universities and therefore this study sought to contribute in filling the identified gaps.

1.1. Purpose

The purpose of this study was to assess the relationship between electronic recruitment management and service quality; and to evaluate the moderating role of organization factors on the relationship between electronic recruitment management and service quality delivery in public universities in the Western Region of Kenya.

2. Literature Review

Gronroos (1990), and Lehtinen and Lehtinen (1991) conceptualized three similar classification of service quality. Gronroos (1990), classified quality dimensions as technical quality, functional quality and corporate image while Lehtinen and Lehtinen (1991) conceptualized service quality as physical quality, interactive quality and corporate quality. The technical and functional dimensions by Gronroos and Lehtinen are consistent with Nordic school of thought which holds the view that, effective quality service delivery should have two important dimensions, namely technical and functional quality. Technical quality is what customers receive from services provided by an organization and functional quality is about how an organization delivers its services to customers (Brady & Cronin, 2001). Later, the quality service delivery construct has been modified and simplified by US school of thought where it proposes that effective quality service delivery should have five specific dimensions, namely tangible (physical facilities, equipment, and appearance of workers), reliability (ability to perform the promised service dependably and accurately), responsiveness (willingness to help customer and provide prompt service), assurance (knowledge and courtesy of workers and their abilities to inspire trust and confidence), and empathy (caring, individualized attention the organization provides its customers) (Ismail and Yunan, 2016). Owlia and Aspinwall (1996) conducted a factor analysis of 30 items on service quality and extracted 7 dimensions of academic resources, support services, competence, attitude, delivery, content and reliability. The researchers later regrouped the seven dimensions into four dimensions after conducting three validity tests. The four dimensions are of academic resources, competence, attitude and content. The three constructs of support services, delivery and reliability were not valid and were dropped from the service quality measurement framework.

Carney (1994) proposed nineteen attributes of measuring service quality in a college. These attributes are student academic qualification, student personal qualities, interaction between faculty and students, quality of instruction, availability of varied courses, academic reputation, class size, career preparation, athletic programs, student social life activities, service rendered to community, facilities and equipment, location, physical appearance of the campus, on-campus residence, friendly, caring atmosphere, religious atmosphere, safety on campus and financial costs and aid available. Researchers have acknowledged that most of these variables are highly relevant to the measurement of service quality in university context. Some of these attributes by Carney are similar with Athiyaman (1997), who adopted eight attributes to examine university education services namely; availability of library services, computing facilities, recreational facilities, teaching the students well by faculty, level and difficulty of subject content, workload given to students and student numbers in each class and availability of university staff to be consulted by students. Hadikoemoro (2002) in a research study that focused on public and private universities captured thirty-five items of service quality after conducting two focus group interviews and after factor analysis seven items were dropped and 28 items remained and five dimension of service quality were extracted as follows academic services, readiness and attentiveness, fairness and impartiality, tangibility and attitudes. Academic services concern the ability of the university to perform services dependably and accurately, and also the completeness of academic-support facilities. Readiness and attentiveness dimension are about the university willingness and attentiveness to help students, and provide prompt service at all times. Fairness and impartiality on the other hand concerns the ability of the university to implement democratic campus regulations and apply discipline to all members. Tangibility is about the appearance of the university based on complete and modern equipment, physical facilities and neatness of employees. General attitudes cover fairness of grading and courteous handling of student issues.
Yusof, Rahman, & Ghouri, (2012) in their study on Educational Service Quality at Public Higher Educational Institutions targeting research universities and non-research universities in Malaysia concluded lack of significant difference in the importance educational service quality dimensions between research universities and non-research universities. From the student perspective they identified ten dimension of educational service quality namely; reliability, assurance, empathy, responsiveness, tangibles, communication, expertise, secondary services, social responsibility and self-development. This study therefore covered five specific dimensions of service quality namely; tangibles which included physical facilities and equipment, reliability which involved consistency and dependability in service provision, responsiveness which involved willingness by the service provider to help customers and provide prompt service, assurance which involved ability to convey trust and confidence, and empathy which involve showing care and individualized attention by the service provider. Customer experience which considered aspects like time taken, resolution of complaints, costs involved, behaviour of service givers; tangible factors for instance physical facilities, equipment, and appearance of workers), reliability which involves ability of staff to perform the promised service dependably and accurately; responsiveness which involves willingness to help customer and provide prompt service; assurance which involves knowledge and courtesy of workers and their abilities to inspire trust and confidence in the customers; and empathy which involves caring, individualized attention the organization provides its customers. It also covered the aspects of service culture and employee engagement as measures of quality service delivery.

3. Research Methodology

3.1. Research Design

This study adopted a mixed methods research approach where explanatory, correlational and survey designs were adopted. Mixed methods research approach presents more than one approach to examining a research problem. Tashakkori and Creswell (2007) observed that mixed method is characterized by focus on research problems that require an examination of real-life contextual understandings, multi-level perspectives, and cultural influences. It also entails an intentional application of rigorous quantitative research assessing magnitude and frequency of constructs and rigorous qualitative research exploring the meaning and understanding of the constructs. Mixed methods research draws on the strengths of quantitative and qualitative data gathering techniques to formulate a holistic interpretive framework for generating possible solutions or new understandings of the problem (Cresswell and Plano, 2007). This study focused on real life contextual situations in public universities in the Western Region of Kenya, particularly on diverse aspects of electronic human resource management and service quality delivery. It handled both quantitative and qualitative data in assessing the influence of e-HRM practices on service quality delivery which were considered to require the mixed method research approach. The target population of this study was 5,467 teaching and administrative staff, 6 human resource officers, and 42 student leaders from the Students Governing Council (SGC) from the six universities in Western Region. Teaching staff and administrative staff comprised of 1,343 and 4,124 employees respectively. In the study, administrative and teaching staff were considered as the main target population for the reason that in as much as they are the primary service providers to both internal and external customers, they are the main consumers of the e-RMP services and not the students. For instance, all practices on human resourcing, compensation and benefits, training and development staff relations, staff discipline affect the staff directly more than they do affect students. The sample size and distribution of the respondents for this study was as indicated in Table 1.

| Name of University                                      | Strata | Target Population | Sample Size Calculation n = \( \frac{\text{no} + \text{no}}{N} \) | Sample Size |

Table 1: Sample Size and Distribution of Respondents per University
Source: Survey Data, 2019

3.2. Data Compilation, Analysis and Presentation

Data was analysed quantitatively and qualitatively using descriptive statistics.

3.2.1. Descriptive Analysis

Statistics for overall demographic profile of the sample were as presented in Table 4.7.
The overall demographic measure for this study indicated that 48.6% male and 51.4% female respondents participated in the study as shown in Table 4.7. The age of the participants ranged from 20 to 60 and above with the highest frequency and percentage (40.6%) being in the age bracket of 41 to 50. The study also involved participants of various academic qualifications ranging from other (which included certificate, diploma and higher diploma) to PhD with the highest percentage (31.2%) of respondents being those with master’s degrees. The study also involved 43% of teaching and 57% of administrative staff. Thirty-nine-point two percent (39.2) of respondents were those who had worked in their current stations for between 1 and 5 years; 31.5% had worked for between 6 and 10 years, 21.7% had worked for between 11 and 15 years and 7.6% had worked for between above 16 years. Thus, the study covered both the long serving and new entrants into the university service hence the information gathered was inclusive of both the old and new staff. Therefore demographically, this study covered respondents of both male and female gender, all official working ages, academic qualifications, designations and length of service in their respective current stations as at the time of the study.

3.2.2. Descriptive Characteristic for Dependent Variable (Service Quality Delivery)

Respondents were assessed on service quality delivery in public universities using the matrix with questions on quality service delivery, they were asked to put a tick (√) in the column to the right side of the option that best suited their response. The rating was on a scale of 1 to 5 with 1 denoting Strongly Disagree, 2 - Disagree, 3 – Somewhat Agreed, 4 - Agree and 5 – Strongly Agree. Results for descriptive analysis for SQD were as indicated in Table 3.

| Statement | SD | D | SWA | A | SA | Mean | Std. Dev. |
|-----------|----|---|-----|---|----|------|----------|
| SQ1       | 14 | 15 | 62  | 136| 51 | 3.7  | 0.995    |
| SQ2       | 8  | 34 | 121 | 75 | 39 | 3.37 | 0.968    |
| SQ3       | 10 | 15 | 129 | 62 | 59 | 3.53 | 1.005    |
| SQ4       | 14 | 105| 56  | 69 | 28 | 2.97 | 1.123    |
| SQ5       | 13 | 88 | 47  | 90 | 33 | 3.15 | 1.147    |
| SQ6       | 13 | 111| 60  | 64 | 27 | 2.93 | 1.104    |
| SQ7       | 9  | 88 | 49  | 84 | 46 | 3.25 | 1.169    |
| SQ8       | 13 | 26 | 129 | 67 | 41 | 3.35 | 1.3      |
| SQ9       | 7  | 21 | 113 | 101| 30 | 3.46 | 0.884    |
| SQ10      | 6  | 45 | 62  | 98 | 61 | 3.6  | 1.075    |
| SQ11      | 22 | 121| 43  | 55 | 37 | 2.87 | 1.213    |

Table 3: Descriptive Statistics for SQD
Source: Research Data, 2019

Average Satisfaction level of Quality Service Delivery: 3.2953, 66%, .66700, .03958
Results in Table 3 revealed that 5% of the respondents strongly disagreed that use of e-RMP in their university had reduced the time for providing services to customers 5% disagreed, 49% somewhat agreed, 22% agreed and (18%) strongly agreed, with the statement; 3% of the respondents strongly disagreed that e-RMP practices in our university saves time and has helped employees to be more efficient in their work, 12% disagreed, 44% somewhat agreed, 27% agreed and (14%) strongly agreed, with the statement; 4% of the respondents strongly disagreed e-RMP in my university has ensured customer complaints are addressed promptly by HR department, 5% disagreed, 47% somewhat agreed, 23% agreed and (21%) strongly agreed with the statement; 5% of the respondents strongly disagreed that e-RMP practices in our university has reduced customer complaints on HR services, 39% disagreed, 21% somewhat Agreed, 25% agreed and (10%) strongly agreed with the statement; 5% of the respondents strongly disagreed that the university has used e-HRM to create awareness on costs of services provided to customers, 9% disagreed, 47% somewhat Agreed, 24% agreed and (15%) strongly agreed with the statement; 3% of the respondents strongly disagreed that the university uses e-RMP to create awareness on costs of services provided to customers, 8% disagreed, 42% somewhat Agreed, 37% agreed and 11% strongly agreed with the statement; 2% of the respondents strongly disagreed that use of e-RMP system in their university had made staff confident in the way they handle their work, 17% disagreed, 23% somewhat Agreed, 36% agreed and 22% strongly agreed with the statement; 8% of the respondents strongly disagreed that university uses e-RMP system to ensure no extra charges are levied on services rendered, 44% disagreed, 15% somewhat Agreed, 20% agreed and 13% strongly agreed with the statement.

On average, the satisfaction level for SQD was 66% (mean = 3.2933, Std. Dev. = 0.667) (Table 4.8), rated moderate. There was no mean of 4 or five on any of the items in the questionnaire. This implies that the level of satisfaction with service quality in universities in the Western Region of Kenya is moderate. Thus, staff are moderately satisfied with the quality of services they receive from the respective HR departments in universities. The moderate level of satisfaction with quality service delivery observed in this study could be attributed to the challenges faced by the public universities in the Western Region of Kenya, thus limiting them from achieving quality services delivery.

The challenges facing public universities in the Western Region of Kenya include inadequate ICT infrastructure to support full-fledged adoption of technology; organization factors which include restructuring of the institutions for purposes of maximizing utilization of e-services; and attitude of employees towards utilization of e-services. These challenges pose a risk on employee engagement, which in its absence would directly affect quality service delivery. These observations agree with Shuck, & Zigarmi (2016) observed that work engagement, job engagement, organizational engagement, and intellectual/ social engagement were constructs of employee engagement that if adopted and implemented would result into quality service delivery. Furthermore, Watson (2009) observed that an efficient human resource management structure enables companies to deal with matters related to human resource adequately. This assists the employees deliver an acceptable quality of services, in spite of the challenges within and without the organization. These observations agree with Walter (2017) who posited that a robust human Resource management structure assists organization give more priority to their organizational and business plans while efficiently administering the variations inherent in their daily operations. Human Resource management assists in attracting and maintaining competent staff, assists staff and management in embracing to organizational change, and allows the application of technology in determining how and where a job is performed leading to improved service delivery.

3.2.3. Descriptive Characteristic for Independent Variables (E-Recruitment Management Practice E-RMP)

This section presents results and discussions on Preference between electronic media and print media, e-recruitment platforms used in universities, perception towards use of e-recruitment the universities, descriptive statistics for e-recruitment practice.

Respondents were asked to indicate their preference in relation to electronic and print media in communicating information on recruitment in their respective universities. The results were as shown in Table 4.

| Preferred Media  | Count Response | % Response |
|------------------|----------------|------------|
| Electronic Media | 274            | 99.3%      |
| Print Media      | 2              | 0.7%       |
| Total Response   | 276            | 100%       |

Table 4: Preference between Electronic and Print Media
Source: Research Data, 2019

From the findings in Table 4, majority of the respondents, 99.3% prefer use of electronic media to print media (0.7%) when communicating information on recruitment in the university. Electronic media was preferred because its convenience in circulating and storage of electronic information without limitation of time and space. In addition, use of electronic media helps the universities to cover a wider population when advertising; and it is also less costly when compared with print media. Retrieval of electronic information is easy, fast and convenient as it can be accessed from
anywhere. These results indicate that both administrative and teaching staff prefer electronic platforms in their operations. Universities can capitalize on this preference by engaging employees more on a single platform. It also indicates a lot of potential on electronic platforms. This agrees with Chapman and Webster (2003) who observed that use of e-system in recruitment and selection of candidates for advertised positions heightens efficiency in hiring systems which could be achieved by reduction in selection cycle time in comparison with the manual approaches that may cause withdrawal by applicants and give the opportunity to the competitors to hire the best applicants.

The study sought to determine the E-Recruitment platforms used by most of the universities in the Western Region of Kenya. The responses were as shown in Table 5.

| Electronic Media | Count Response | N   | % Response |
|------------------|----------------|-----|------------|
| Website          | 262            | 276 | 95%        |
| Email            | 166            | 276 | 60%        |
| What's App       | 138            | 276 | 50%        |

*Table 5: Electronic Media Commonly Used*

From the findings in Table 5, majority of the respondents, 95% indicated that their respective universities use Website to communicate information on the recruitment process, 60% use email, and 50% claim that their respective universities use WhatsApp media to disseminate the information on recruitment. Use of respective university websites was commonly used because the website is considered an official e-platform on which official university information is communicated to a wide range of interested persons within and outside the country. In this way, the university can attract applicants from all over the world to create a large pool of qualified professionals from which suitable candidates can be selected. Email and WhatsApp are used as complementary platforms for increasing circulation of advertisements to a wider population. Use of the two complementary e-platforms is not limited to university staff, but information picked by the public is circulated to interested parties. WhatsApp is minimally adopted as an official complementary e-platform because once information goes out, it is picked by other people and circulated on walls where the universities do not have control on information circulated. Information on WhatsApp is usually circulated informally and is bound to be distorted as it moves on various walls.

The observations above agree with Chapman and Webster (2003) who posited that use of E-system of recruitment and selection lowers costs to the organization; is cheaper than advertising in the newspapers. Maric and Ilic (2012), observed that when using e-recruitment system, the organization will eliminate intermediaries, reduce in the time for recruitment (over 65 percent of the hiring time), facilitate the recruitment of right type of people with the required skills thus improving in efficiency of recruitment process and that it gives a 247 access to an online collection of resumes. Chapman and Webster (2003) also observed that online recruitment helps the organizations to weed out the unqualified candidates in an automated way. Besides, recruitment websites also provide valuable data and information regarding the compensation offered by the competitors, which helps the HR managers to take various HR decisions like promotions and on salary trends in industry.

The study sought to determine respondents’ perception towards use of E-Recruitment services in public universities in the Western Region of Kenya. The responses were as shown in Table 6.

| Do you think effective use of Electronic media in recruitment processes can contribute to improved efficiency in recruitment of staff at the university? | Count Response | % Response |
|-------------------------------------------------------------------------------------------------------------------------------|----------------|------------|
| Yes                                                                                | 273            | 99%        |
| No                                                                                 | 3              | 1%         |
| Total Response                                                                     | 276            | 100%       |

*Table 6: Perception towards Use of E-Recruitment Services*

The findings in Table 6 indicated that majority of the respondents, 99% think that if electronic media is effectively implemented, it can improve efficiency in recruitment of staff at their respective universities. The study, therefore, sought to assess the use of e-recruitment services in the exercise of recruiting staff in the universities and the results were as follows:

Respondents were asked to give their opinion on E-RM practice in their universities. Using the matrix with questions on E-RM practice, they were asked to put a tick (✓) in the column to the right side of the option that best suited their response. The rating was on a scale of 1 to 5 with 1 denoting Strongly Disagree, 2 - Disagree, 3 – Somewhat Agree, 4 - Agree and 5 – Strongly Agree. The findings were as indicated in Table 7.
### Table 7: Descriptive Statistics for Electronic-Recruitment Management

Source: Research Data, 2019

| Statement | SD | D | SWA | A | SA | Mean | Std. Dev |
|-----------|----|---|-----|---|----|------|----------|
| E-Recruit1 | 113 | 15 | 31 | 48 | 79 | 2.88 | 1.703 |
| E-Recruit2 | 91 | 35 | 39 | 74 | 43 | 2.8 | 1.501 |
| E-Recruit3 | 16 | 38 | 118 | 66 | 45 | 3.3 | 1.068 |
| E-Recruit4 | 17 | 21 | 52 | 125 | 65 | 3.71 | 1.089 |
| E-Recruit5 | 20 | 19 | 47 | 141 | 57 | 2.82 | 1.469 |
| E-Recruit6 | 45 | 110 | 43 | 49 | 36 | 2.72 | 1.279 |
| E-Recruit7 | 39 | 96 | 57 | 38 | 48 | 2.86 | 1.311 |
| E-Recruit8 | 45 | 39 | 33 | 123 | 76 | 3.78 | 1.091 |
| E-Recruit9 | 37 | 121 | 30 | 49 | 48 | 2.82 | 1.328 |
| E-Recruit10 | 91 | 19 | 71 | 59 | 45 | 2.82 | 1.469 |

Mean | % Mean | Std. Deviation | Std. Error of Mean |
---|------|---------------|------------------|
Average Satisfaction level in E-Recruitment HRM services | 3.1379 | 63% | .79646 | .04701 |

Results in Table 7 revealed that 40% of the respondents strongly disagreed that the University has established internal electronic communication mechanisms e.g. use of internet and social media platforms for recruitment of applicants, 5% disagreed, 11% somewhat agreed, 12% agreed and (28%) strongly agreed, with the statement; 32% of the respondents strongly disagreed that applicants are allowed to inquire/seek clarification on recruitment using electronic media, 12% disagreed, 14% somewhat agreed, 26% agreed and (15%) strongly agreed, with the statement; 6% of the respondents strongly disagreed that the university communicates information to recruitment panelists using electronic medium, 13% disagreed, 42% somewhat agreed, 23% agreed and (16%) strongly agreed, with the statement; 6% of the respondents strongly disagreed that the university requests for departmental staffing needs using intra-university email network, 8% disagreed, 19% somewhat agreed, 45% agreed and (23%) strongly agreed, with the statement; 7% of the respondents strongly disagreed that the university sends feedback on departmental staffing needs via email and social media, 7% disagreed, 17% somewhat agreed, 50% agreed and (20%) strongly agreed, with the statement; 3% of the respondents strongly disagreed that advertisements for declared vacant positions are placed on the university website, 14% disagreed, 12% somewhat agreed, 44% agreed and (27%) strongly agreed, with the statement; 14% of the respondents strongly disagreed that Job Application Forms are uploaded on the university website, 35% disagreed, 21% somewhat agreed, 14% agreed and (17%) strongly agreed, with the statement; 16% of the respondents strongly disagreed that recruitment of internal staff in the university is processed Electronically, 39% disagreed, 15% somewhat agreed, 17% agreed and (13%) strongly agreed, with the statement; 13% of the respondents strongly disagreed that the university has established internal Electronic system for declaration of vacant positions, 42% disagreed, 11% somewhat agreed, 17% agreed and (17%) strongly agreed, with the statement; 32% of the respondents strongly disagreed that the university makes provision for applicants to submit soft copies of application documents, 7% disagreed, 25% somewhat agreed, 21% agreed and (16%) strongly agreed, with the statement.

On average, the satisfaction level in the e-recruitment practice in the universities in the Western region of Kenya was 63% (mean = 3.1379, Std. Dev. = 0.79646), rated moderate as shown in Table 4.12. There was no mean of 4 or 5 on any of the items in the questionnaire. This indicates that universities in the Western Region of Kenya have moderately implemented e-recruitment management practice. Information gathered from HROs indicated that implementation of e-recruitment practice was on course but was faced with the challenge of inadequate ICT infrastructure upon which compensation modules could be uploaded and implemented. However, it was reported that the universities had phased the establishment of ICT infrastructure in order to facilitate full implementation of e-recruitment practice. There was consensus among HROs that implementation of e-recruitment practice would be beneficial to the universities in the region. Once full implementation would be achieved, there is hope that it will increase efficiency and transparency in the recruitment exercise.

This observation agrees with Marić and Ilić (2012) who posited that cost reduction and higher speed were benefits technology contributed to the selection process, but also, they raise alert about the complication of activities in HR department at initial stage of the transition since for example involvement of the internal relevant employees during the
development of the solution is necessary. Compared with Stefan and Rüdiger (2009) whose study established that e-HRM was a common practice throughout Europe since two-thirds of all organizations had already adopted e-HRM, universities in the Western Region of Kenya are still transitng from the traditional recruitment and selection practice to Electronic practice. It was observed that at the time of this study was when universities in the Western Region of Kenya were catching up with what happened in Europe in the year 2009.

3.2.4. Descriptive Statistics for Organizational Factors (Moderator)

The study sought to determine the moderating effect of organisational factors and their influence on the relationship between relational e-HRM practices e-recruitment management, and service quality delivery in public universities in the Western Region of Kenya. The findings were as detailed in Table 8.

| Statement | SD | D | SWA | A | SA | Mean | Std. Dev. |
|-----------|----|---|-----|---|----|------|-----------|
| Organisational factor 1 | 16  | 91 | 41  | 91 | 43  | 3.19  | 1.204     |
| Organisational factor 2 | 14  | 37 | 145 | 70 | 21  | 3.16  | 0.915     |
| Organisational factor 3 | 5   | 108| 50  | 90 | 26  | 3.09  | 1.073     |
| Organisational factor 4 | 10  | 105| 45  | 79 | 38  | 3.11  | 1.162     |
| Organisational factor 5 | 11  | 106| 78  | 58 | 24  | 2.92  | 1.046     |
| **Average Satisfaction level in E-Performance Management Practices** | **3.1129** | **62%** | **0.79521** | **0.04678** |

From the results in Table 8 above, 6% of the respondents strongly disagreed with the statement that leadership of the university is committed to providing resources for implementation of e-RMP, 32% disagreed, 15% somewhat Agreed, 32% agreed and 15% strongly agreed, with the statement. Five (5%) of the respondents strongly disagreed with the statement that the University has developed and implemented policies to enable operationalization of e-RMP, 13% disagreed, 51% Somewhat Agreed, 24% agreed and 7% strongly agreed, with the statement. Two (2%) of the respondents strongly disagreed with the statement that the university has developed work procedures that support implementation of e-RMP, 39% disagreed, 18% Somewhat Agreed, 32% agreed and 9% strongly agreed, with the statement. Four (4%) of the respondents strongly disagreed with the statement that employees of the university have requisite experience in handling intranet software with regard to e-RMP, 38% disagreed, 28% Somewhat Agreed, 21% agreed and 9% strongly agreed, with the statement. Four (4%) of the respondents strongly disagreed with the statement that there is sufficient infrastructure for implementation of e-RMP in my university, 38% disagreed, 28% Somewhat Agreed, 21% agreed and 9% strongly agreed, with the statement.

On average, the satisfaction level organizational factors in the universities in the Western Region of Kenya was 62% (mean = 3.1129, Std. Dev. = 0.79521), rated moderate as shown in Table 4.21. There was no mean of 4 or 5 on any of the items in the questionnaire. Provision of strategic leadership is a key ingredient in steering the public universities in the Western Region of Kenya reach the goal of quality service delivery. Leadership of the public universities in the region has established structures and documented information on establishment and use of e-RMP in improving service delivery. The universities in the region have prepared policies and procedures that support implementation of e-RMP. Managements’ commitment is observed in universities in the region ensuring provision of physical, financial and human resources. The extent of provision of these resources directly affects the quality of services delivered in public universities in the Western Region of Kenya. It is therefore important that management of respective public universities in the region ensure that these resources are provided for improved quality service delivery.

3.3. Hypothesis Testing - Tests for Regression Assumptions

The study sought to test for the assumptions for linear regression between e-RMP and service quality delivery. These included tests for Normality, Linearity, Homoscedasticity and presence of outliers.

3.3.1. Test for Normality

The study sought to assess whether the scores for the e-RMP variable were normally distributed. To achieve this, the study used the Shapiro-Wilk Test and the findings were as shown in Table 9.
From the results of Table 9, the p-values for all the variables were greater than 0.05 level of significance; E-Recruitment (W= 0.947, p-value = 0.072 > 0.05), and Organisational factors (W= 0.944, p-value = 0.082 > 0.05). The study concludes that the scores for all the variables were significantly normally distributed.

3.3.2. Test for Linearity
To achieve test for linearity between the service quality delivery and the independent variables, the study used Normal P-P Plot and the residual scatterplot. The findings were as shown in the Figure2.

![Normal P-P Plot of Regression Standardized Residual for E-RM Practice](source)

In Figure 2 the points lie in a reasonably straight diagonal line from bottom left to top right; this was an indication that there was a linear relationship between e-recruitment and service quality delivery.

3.3.3. Test for Homoscedasticity
Homoscedasticity refers to the assumption that the dependent variable exhibits similar amounts of variance across the range of values for an independent variable. To achieve test for test for homoscedasticity, the study used the residual scatterplots and the findings were as shown in the Figures 4.6.

![Scatter Plot of Standardized Residuals for E-RM Practice](source)
In the Scatterplot shown in Figure 3 shows that the residuals are roughly rectangular distributed, with most of the scores concentrated in the centre, thus an indication that the assumption of homoscedasticity holds.

3.3.4. Multicollinearity Test

The study adopted the use of Variance Inflation Factor (VIF), tolerance values and correlation coefficients to detect multicollinearity as shown in Table 10 and 15 respectively. The study utilized the centering of independent variables and moderator variables prior to computing interaction terms to counter multicollinearity (Hayes 2013). This was tested through the visual inspection of variance inflation factors which revealed acceptable values which were all below the set values of -10 to 10. To further confirm that there was no multicollinearity, tolerance values were checked and it was established that they were all below 1.0 which is the accepted standard according to Hayes (2013).

| Variable     | Tolerance (1/VIF) | VIF  |
|--------------|------------------|------|
| E-Recruitment| 0.532            | 1.879|

*Table 10: Multicollinearity Test Using Variance Inflated Factor (VIF)*  
Source: Research Data, 2020

The correlation analysis results were based on threshold by (Moore, 2004). According to Moore, a bivariate Pearson correlation coefficient above 0.9 indicates multicollinearity. Therefore, for the independent variables, the study indicates that there was no multicollinearity among the independent variables thus supporting the Variance Inflation Factors (VIF) findings of Table 10 above.

| Service Quality | Electronic Recruitment | Electronic Compensation | Electronic HR Training |
|-----------------|------------------------|-------------------------|------------------------|
| Electronic Recruitment Pearson Correlation | .558** | 1 | |
| p-value | .000 | | |

*Table 11: Correlation Matrix*  
**. Correlation is significant at the 0.01 level (2-tailed)

The correlation coefficients in the correlation matrix (15) show that none of the coefficients between independent variable was above 0.9. From the results of Table 11, e-recruitment management had a significantly positive relationship with the service quality delivery in (r = 0.558 > 0.5, p = 0.000<0.05). A coefficient (r) between +0.5 and +1 or -0.5 and -1 indicates a strong relationship based on the argument by Lyndsay (2009), therefore, the study conclude that e-recruitment management had a significantly strong positive relationship with the service quality delivery among the universities in Western Kenya.

3.3.5. Results for Simple Linear Regression Analysis

Model 1 represents the results of the simple linear regression for e-recruitment.

| Model Summary | Model 1 |
|---------------|---------|
| R             | 0.558   |
| R Square      | 0.312   |
| Adjusted R Square | 0.309 |
| Std. Error    | 0.55509 |
| ANOVA         |         |
| Degrees of freedom (a,b) | (1,280) |
| F-statistic F(a,b) | 126.760 |
| p-value for F-statistic | 0.000 |
| Regression Coefficients |     |
| Intercept     | 1.819   |
| β (Unstandardized coefficient) | 0.467 |
| Standardized Beta Coefficient | 0.558 |
| t(β)          | 11.259  |
| p-value (β)   | 0.000   |
| t (Intercept) | 13.500  |
| p-value (Intercept) | 0.000 |

*Table12: Results of Hypothesis Testing*  
Source: Research Data, 2020

The hypothesis for the study was, H01: E-recruitment management has no significant influence on service quality delivery in public universities in the Western Region of Kenya. The Coefficient results in Table12 showed a positive
significant influence ($\beta = 0.467$, t = 11.259, p=0.000<0.05) and therefore the study rejected the null hypothesis and concludes that e-recruitment management had a statistically significant influence on service quality delivery in public universities in the Western Region of Kenya. Electronic recruitment management had a positive standardized beta coefficient value of 0.558 as shown in the coefficients results of Table12, an indication that a unit improvement in the e-recruitment management practices was likely to result to an improvement in the quality service delivery in public universities in the Western Region of Kenya by 55.8%. The ANOVA results as shown in model 1 in Table 4.25 were, F (1, 281) = 126.760, P = 0.000 < 0.05; this was a clear indication that the linear regression model was a good fit to the dataset. The model (E-recruitment management practices) was able to explain 31.2% of the variation in the service quality delivery in public universities in the Western Region of Kenya as indicated by the R Square value of 0.312 as shown Table 4.25. The following was the linear regression model to predict the service quality delivery in public universities in the Western Region of Kenya when given the level of effectiveness of the e-recruitment management practices:

$$\text{Service Quality Delivery} = 1.819 + 0.467 \times \text{E-Recruitment management practices}.$$  

According to the results of the model, e-recruitment management practices do improve service quality delivery in employee recruitment in public universities. This is because in the adoption of e-RM practice, information on advertised positions reaches many qualified persons within specified time at a very minimal cost. In electronic advertisement, the information is circulated to employees even areas where print media will not reach so long as there is network coverage for internet services. Smart phones are used to access the information on advertised positions at the convenience of people searching for jobs. Therefore, when many staff access advertisements and submit applications in large numbers, it creates a bigger pool of applicants from which the most qualified and most suitable candidates can be selected. Thus, e-recruitment management practice increases efficiency in the recruitment process, lowers costs of advertisement, brings about convenience, and eliminates mediocrity in the recruitment exercise therefore improving quality service delivery.

The findings of this study agree with Stone and Lukaszewsky, (2013) who observed that online recruitment systems enable organizations to share important details about the positions available and also provide more specific information such as job descriptions. In addition, the findings reflect the observations by Parry and Wilson, (2009) who observed that institutions generally adopt a recruitment method that suits their size and budget for recruitment. Further, Galanaki, (2002) posited that the size and nature of the fraction that applies for an organization’s vacancies will be affected by how (and to whom) the organization communicates its vacancies. In this case, public universities covered by this study have adopted online recruitment by adding recruitment pages to existing university websites; using specialized recruitment websites such as job portals, online job boards; developing interactive tools for processing applications; and using screening techniques. This study confirmed that technology has made it possible for the universities to become paperless where there is a possibility of creating portals and folders that could be used to archive employees’ documentation such as offer-letters, credentials, CVs or recommendation letters. The study found out that applicants for positions are asked to submit their documents to HR officers in soft copy with no need of hard copies. It can as well be used with current employees’ health insurance or car contracts, salary or information on other benefits. This observation resonates with that of Jackson et al., (2011).

### 3.3.6. Moderated Hierarchical Linear Regression Analysis

This sub-section presents results and discussions on moderation effect of organisational factors on the relationship between e-recruitment management and service quality delivery in public universities in the Western Region of Kenya.

The second objective of the study was to determine the moderation effect of organisational factors on the relationship between e-recruitment management and service quality delivery in public universities in the Western Region of Kenya. The study adopted the use of hierarchical linear regression analysis to assess the moderation effect. The variables were centred in order to avoid potentially problematic high multicollinearity with the Interaction terms created (Lyndsay, 2009); the Interaction term (I) is the Interaction effect between the independent variable and the moderator. Lyndsay (2009) further concluded that a significant interaction effect indicates presence of the moderation effect. The findings were as summarised in Table 4.26.

### 3.3.7. Results for Moderation Analysis

Model 2 represent the results for moderation analysis for e-recruitment management using hierarchical linear regression. Model 2 presents the results for moderation analysis for e-compensation management using hierarchical linear regression.

| Model Summary | Model 2 |
|---------------|---------|
| R             | 0.567   |
| R Square      | 0.322   |
| Adjusted R Square | 0.317 |
| Std. Error    |         |
| ANOVA         |         |
| Degrees of freedom (a,b) | (2,279) |
| F- statistic, F(a,b) | 66.131  |
| p-value for F-statistic | 0.000  |
Hypothesis H02a states that there is no significant moderating effect of organizational factors on the relationship between e-recruitment and service quality delivery in public universities. Based on the findings in Table 13, model 5 shows that the interaction effect for organizational factors had a negative and significant influence on the relationship between e-recruitment and service quality delivery as indicated by significant beta and p values ($\beta = -0.077$, p-value $=0.044 < 0.05$). Therefore, the study rejected the null hypothesis (H05a) and concluded that organisational factors had a negative significant moderation effect on the relationship between e-recruitment management and service quality. The ANOVA results as shown in model 5 of Table 13 were significant as indicated by the F-Statistic, $F(1, 279) = 66.131$, $P = 0.000 < 0.05$ which indicated that the moderated hierarchical linear regression model was a good fit to the dataset. The overall model was able to explain $32.2\%$ of the variation in service quality delivery as indicated by the $R^2$ value of 0.322 in Table 13. To determine how the organisational factor moderates the relationship between e-recruitment management and the service quality delivery, the study used the interaction Plots as suggested by Brien (2007). The plot is as shown in Figure 3.

![Interaction Plot](image)

**Figure 3: Interaction Plot on Moderation Effects of Organizational Factors on the Relationship between E-RM and Service Quality Delivery**

*Source: Research Data, 2020*

Close and thorough examination of the interaction plot in Figure 3, revealed that organisational factors demonstrated an enhanced negative moderation effect on the relationship between e-recruitment management and service delivery. When the level of implementation of the organisation factors is low, e-recruitment management seem to have a lower influence on service quality delivery compared to moderate and high levels of implementation, and when the level of implementation of the organisation factors is moderate, e-recruitment management seem to have a lower influence on the service quality delivery compared to high levels of implementation of the organisational factors.

Creating a pool of quality applicants from which candidates for advertised positions are selected is key in establishing quality human resource workforce. As such, Management's strategy in ensuring a successful e-recruitment exercise needs to be underscored. Allocation of resources by management towards creation of e-recruitment platforms in the respective public universities in the Western Region of Kenya creates an environment that facilitates efficiency in the recruitment processing and improves on the quality of the recruits. Therefore, continued support towards implementation of e-recruitment practice leads to establishment of a culture that satisfies both the universities in the region and the applicants. Easter, (1996) observed that culture determines differential treatment of personnel performing the same
functions and may have a negative impact on overall mission effectiveness, as people performing the same tasks, under the same conditions and threats, receive different treatment or rewards. Staff may develop negative opinions and perceptions and this might result in dissatisfaction in the short-term and retention issues in the long-term. The outcome may inhibit the development of a healthy organizational climate, which in turn may impact the organization performance and the effectiveness and success of the operation (Macey, et al, (2009). Thus, the way the university establishes a culture influences the way e recruitment is operationalized and managed.

A summary of hypotheses testing results is presented in Table14.

| Hypothesis No. | Description | Result | Decision |
|---------------|-------------|--------|----------|
| H01:          | E-recruitment management has no significant influence on service quality delivery in public universities in the Western Region of Kenya. | $(\beta = 0.467, t = 11.259, p=0.000<0.05)$ | Rejected the null hypothesis |
| H05a          | There is no significant moderating effect of organizational factors on the relationship between e-recruitment and service quality delivery in public universities | $(\xi = 0.077, p-value =0.444 < 0.05)$ | Rejected the null hypothesis (H05a) |

Table14: Summary Table for Hypotheses Testing

Human Resource Officers from the six universities indicated that universities advertise vacant positions using print and electronic media. In print media, they advertise in local daily newspapers that have national coverage. Besides print media, the universities use their websites to advertise for vacant positions that require filling. It was reported that electronic media was found to be the fastest way of relaying information on advertised vacancies to a wider scope of interested applicants. Applicants use various electronic platforms such as WhatsApp, Facebook, twitter, messenger and other modes to relay information to possible applicants.

It was reported by HROs that use of electronic advertisement was found to be more advantageous than use of print media. HROs were in agreement that electronic advertisements reached far and wide and were not restricted local coverage alone. It was reported that electronic mode of recruitment reached people in foreign countries thus attracting more qualified applicants for the advertised positions. These findings corroborate the findings of the questionnaire. In the questionnaire, the mean for most of the questions was 3.14 which indicates that majority of the respondents somewhat agreed with the statements, an indication that implementation of E-recruitment and service quality delivery in the universities was moderate. In the questionnaire it was also observed that there was no mean of 4 and 5 on any of the questionnaire items. This indicates that universities still had a lot to do in linking E-recruitment management to service quality delivery.

HROs from the sampled universities indicated that the universities had installed and were using enterprise resource planning (ERP) software in processing payments to staff. The findings indicated that though ERP had been installed in all the six universities, implementation of the finance and human resource modules which are used to compute employee remuneration and payments were at different levels. In one university, all processes involving computing, giving necessary approvals and wiring money to the staff accounts is done online while in the other five universities, they blend electronic and manual systems. HROs explained that the main challenge facing the universities in full implementation of ERP software was insufficient ICT infrastructure. These findings corroborate the findings of the questionnaire. In the questionnaire, the mean for most of the questions was 3.07 which indicates that majority of the respondents somewhat agreed with the statements, an indication that implementation of E-compensation and service quality delivery in the universities was moderate. In the questionnaire it was also observed that there was no mean of 4 and 5 on any of the questionnaire items. This indicates that universities still had a lot to do in linking E-compensation management to service quality delivery.

The findings from nominal group discussions with students revealed that students were moderately satisfied with the physical facilities in their respective universities. The students held the opinion that insufficient physical facilities in their universities affected the service offered to them by staff. However, they appreciated efforts made by the universities in improving physical facilities as time went by.

Students leaders observed that though universities had made effort to provide ICT equipment to staff, there was still a challenge since not all staff had been facilitated to get ICT Equipment that would enable them provide quality service. They observed that staff were using the limited ICT equipment available to provide electronic services. This had improved flexibility in staff work environment and had made staff to improve the quality of services they received from staff. In all the universities, student leaders observed the internet coverage was a big challenge as internet could only be accessed in certain areas and not others. They explained that non-resident students could not access internet services in their areas of residence unless they came to the universities. The findings indicated that employees in the universities were most of the times in official wear. The staff looked neat and they were warm to them as time progressed.

Student leaders observed that it was difficult to even press some staff on dates that fall in the middle of the months, leave alone whether they were willing to help or not. However, some student leaders observed that staff generally helped them whenever they presented issues. Other student leaders confirmed that staff in the university were generally cordial in their relationship with students, were fair in their dealings, appeared neat and were welcoming to students. Half of the student leaders observed that there was trust and confidence inspired by the teaching and administrative staff in the universities. They reported that there were cases of trusted staff both in teaching and administrative positions. However,
they indicated that there were reports of staff who had even conned students of their monies. Other responses indicated that some teaching staff did not inspire confidence in the students as they missed lectures and involved themselves in malpractices with students. However, the student’s leaders doubted staff who went beyond requirements of their line of duty to help students. They cited cases of staff who did extra work with students, provided adequate learning resources and facilitated students to get requisite learning materials. Such staff won the trust of students wholesome.

Student leaders indicated that since introduction of electronic services in the universities, the staff improved in the performance of their duties. Students confirmed that the level of accuracy in performance of services had steadily increased. In addition, student leaders confirmed that they had observed that staff were more willing to provide services than in the past. They further confirmed that as time progressed, and as staff were getting used to integrating ICT in the operations, they were winning trust and confidence of students.

Student leaders also reported that though the universities were registering improvement in how they provided service to students, there were still areas where students concerns had been raised but were not addressed as fast as was anticipated. For instance, they observed that there were cases of missing marks that made some students not to graduate on time. They also reported that they could receive details about their fee payment through electronic messages, they still noted that there were cases of irregularities in their statements thus making some of them to be denied chance to sit for their examinations.

These results agree with the observations made in the findings in the questionnaire and in the interview schedule for the HROs. In the questionnaire, it was noted that staff were moderately satisfied with e-HRM operations and service quality with an average mean of 3.22.

4. Summary of Findings, Conclusions and Recommendations

The study purposed to establish to assess the influence of e-recruitment practices on service quality in public universities in the Western Region of Kenya. The findings of the study revealed that on average, the satisfaction level in the e-recruitment in the Universities in the Western region of Kenya was 63% (mean = 3.1379, Std. Dev. = 0.79646), rated moderate. The results indicated that e-recruitment Practice had a significantly strong positive relationship with the service quality in universities in Western Kenya (r = 0.558; p = 0.000<0.05). A coefficient (r) between +0.5 and +1 or -0.5 and -1 indicates a strong relationship. ANOVA test showed a positive significant influence of e-recruitment management on service quality β = 0.467, t = 11.259, p=0.000<0.05.

The second objective of this study was to investigate the moderating role of organization factors on the relationship between e-recruitment management and service quality in public universities in Western Region of Kenya. The findings revealed that organizational factors had a negative significant effect on the relationship between e-recruitment management and service quality delivery in public universities in the Western Region of Kenya respectively. However, the findings also revealed that organizational factors had no significant effect on the relationship between e-HR training management and e-performance management and service quality delivery in public universities in the Western Region of Kenya as indicated by β = -0.032, t =-0.787, p-value =0.432 > 0.05] andβ = -0.030, t =-0.762, p-value =0.447 > 0.05] respectively.

Findings from HROs indicate that universities were transiting from the traditional human resource management to electronic human resource management. The human resource management officers observed that operationalization of e-RMP and its influence on service quality was moderate. Findings from student leaders indicated the service quality offered by both teaching and administrative staff was moderate.

Based on evaluation of the hypotheses and on the findings of this study, the conclusions the study rejected the null hypothesis and concluded that e-recruitment had a statistically positive significant influence on service delivery in public universities in the Western Region of Kenya. Further, the study concluded that organizational factors have a negative significant moderating effect on the relationship between e-recruitment management practices on service quality delivery in public universities in the Western Region of Kenya.

This study contributes to the body of knowledge by providing a strategic framework based on relational e-RMP practice dimensions that public universities can use to improve on service quality delivery. The findings of this study have led to the development of a new model which states that the relational e-RMP practice dimensions: e-recruitment management practices can be adopted as a strategy to improve service quality delivery contrary to some of the previous findings.

The study contributes to the empirical literature by establishing that electronic recruitment management dimension has a significant relationship with quality service delivery in public universities in the Western Region of Kenya and that public universities should focus on implementing the relational e-HRM strategy appropriately by focusing on training programmes that support the implementation of the relational e-HRM practice strategy.

The study brings out the importance of the independent variable: e-recruitment management practice to service quality delivery. This is a departure from the previous relational HRM practices that were not information technology based. The findings will be used in the education industry to ensure that despite the challenges experienced; they can reach the target of quality service delivery by operationalizing relational e-RM Practice.

The study recommends that public universities in the Western Region of Kenya should upgrade and adopt usage of e-recruitment practice to improve on quality service delivery, commit enough resources for continued improvement of electronic recruitment management in order to improve on quality of service delivered; and that Government through the ministry of education and other education stakeholders should consider increasing funding for ICT infrastructure in universities so as to enable provision of electronic recruitment management. In addition, a longitudinal study would be more preferable as it could provide a better perspective in addition to further informing the policy frameworks of quality.
service delivery. Finally, further research should be carried out in other industries, for example, financial and manufacturing industries whose e-HRM issues closely relate to those of the educational industry.
