ABSTRACT
In this paper we introduce the definition of standard fuzzy quasi-metric space then we discuss several properties after we give an example to illustrate this notion. Then we showed the existence of a standard fuzzy quasi-metric space which is not bicompletable. Here we prove that every bicompletable standard quasi-metric space admits a unique [up to F-isometric] bicompletion.

2000 MSC: 54H25; 47H10; 54E50

Keywords
Standard fuzzy metric space, standard fuzzy quasi-metric space, bicompletable standard quasi-metric space.
INTRODUCTION

In [1] Kider started the study of a notion of standard fuzzy metric space that constitutes an interesting modification of the notion of metric fuzziness due to George and Veeramani [2]. In this paper we extend the notion standard fuzzy metric space to a standard fuzzy quasi-metric space. On the other hand, it was presented in [4] an example of a standard fuzzy metric space that is not completable, also it has been obtained an internal characterization of completable standard fuzzy metric spaces. Taking these results into account and the fact that the concept of bicompletion provides a theory of completion to quasi-metric spaces in the classical sense (for instance see [5]). It seems natural and interesting to discuss the problem of characterizing standard fuzzy quasi-metric spaces that are bicompletable. The main purpose of this paper is to solve this problem. Following the modern terminology (for instance see Section 11 of [5]) by a quasi-metric on a set $X$ we mean a function $d: X \times X \rightarrow [0, \infty)$ such that for all $x, y, z \in X$:

(i) $d(x, y) = d(y, x) = 0$ if and only if $x = y$

(ii) $d(x, y) \leq d(x, z) + d(z, y)$

Each quasi-metric $d$ on $X$ generates a $T_0$-topology $\tau_d$ which has a base the family of open balls $\{ B_\varepsilon(x) : x \in X, \varepsilon > 0 \}$.

1. STANDARD FUZZY METRIC SPACE

Definition 1.1:[3] A binary operation $*: [0,1] \times [0,1] \rightarrow [0,1]$ is a continuous $t$-norm if it satisfies the following conditions:

1. $*$ is associative and commutative.

2. $*$ is continuous.

3. $a*1 = a$ for all $a \in [0,1]$.

4. $a*b \leq c*d$ whenever $a \leq c$ and $b \leq d$ where $a,b,c,d \in [0,1]$.

Remark 1.2:[2] For any $r_1 > r_2$ we can find $r_3$ such that $r_1*r_3 \geq r_2$ and for any $r_4$ we can find an $r_5$ such that $r_5*r_5 \geq r_4$ where $r_1,r_2,r_3,r_4,r_5 \in (0,1)$.

We introduce the following definition.

Definition 1.3:[1] A triple $(X,M,*)$ is said to be standard fuzzy metric space if $X$ is an arbitrary set, $*$ is a continuous $t$-norm and $M$ is a fuzzy set on $X^2$ satisfying the following conditions:

(FM1) $M(x,y) > 0$ for all $x, y \in X$

(FM2) $M(x,y) = 1$ if and only if $x = y$

(FM3) $M(x,y) = M(y,x)$ for all $x, y \in X$

(FM4) $M(x,z) \geq M(x,y) * M(y,z)$ for all $x, y$ and $z \in X$

(FM5) $M(x,y)$ is a continuous fuzzy set

Example 1.4:[1] Let $X= \mathbb{N}$, and let $a*b = a.b$ for all $a, b \in [0,1]$.

Define $M(x,y) = \begin{cases} \frac{x}{y} & \text{if } x \leq y \\ \frac{y}{x} & \text{if } y \leq x \end{cases}$

for all $x, y \in \mathbb{N}$. Then $(\mathbb{N},M,*)$ is a standard fuzzy metric space.
Example 1.5:[1] Let $X=\mathbb{R}$ and let $a\ast b = a.b$ for all $a, b \in [0,1]$.

Define $M(x,y) = \frac{1}{e^{x-y}}$ for all $x, y \in \mathbb{R}$. Then $(\mathbb{R}, M, \ast)$ is a standard fuzzy metric space.

Definition 1.6:[1] Let $(X,M,\ast)$ be a standard fuzzy metric space then $M$ is continuous if whenever $x_n \to x$ and $y_n \to y$ in $X$ then $M(x_n,y_n) \to M(x,y)$ that is $\lim_{n \to \infty} M(x_n,y_n) = M(x,y)$.

Definition 1.7:[1] Let $(X,M,\ast)$ be a standard fuzzy metric space. Then $B(x,r) = \{y \in X : M(x,y) > 1-r\}$ is an open ball with center $x \in X$ and radius $r$, $0 < r < 1$.

Proposition 1.8:[1] Let $B(x,r_1)$ and $B(x,r_2)$ be two open balls with same center $x$ in a standard fuzzy metric space $(X,M,\ast)$. Then either $B(x,r_1) \subseteq B(x,r_2)$ or $B(x,r_2) \subseteq B(x,r_1)$ where $r_1, r_2 \in (0,1)$.

Definition 1.9:[1] A subset $A$ of a standard fuzzy metric space $(X,M,\ast)$ is said to be open if given any point $a$ in $A$ there exists $r, 0 < r < 1$ such that $B(a,r) \subseteq A$. A subset $B$ is said to be closed if $\overline{A}$ or $\text{CL}(A)$ is open.

Definition 1.10:[1] A subset $A$ of a standard fuzzy metric space $(X,M,\ast)$ is said to be dense in $X$ if $\overline{A} = X$.

Theorem 1.12:[1] Every open ball in a standard fuzzy metric space $(X,M,\ast)$ is an open set.

Theorem 1.13:[1] Let $(X,M,\ast)$ be a standard fuzzy metric space. Define $\tau_{M^f} = \{A \subseteq X : x \in A$ if and only if there exists $0 < r < 1$ such that $B(x,r) \subseteq A\}$ Then $\tau_{M^f}$ is a topology on $X$.

Theorem 1.14:[1] Every standard fuzzy metric space is a Hausdorff space.

Definition 1.15:[1] A sequence $(x_n)$ in a standard fuzzy metric space $(X,M,\ast)$ is said to be converge to a point $x$ in $X$ if for each $r, 0 < r < 1$ there exists a positive number $N$ such that $M(x_n,x) > (1-r)$, for each $n \geq N$.

Theorem 1.16:[1] Let $(X,M,\ast)$ be a standard fuzzy metric space then for a sequence $(x_n)$ in $X$ converge to $x$ if and only if $\lim_{n \to \infty} M(x_n,x) = 1$.

Definition 1.17:[1] A sequence $(x_n)$ in a standard fuzzy metric space $(X,M,\ast)$ is Cauchy if for each $r, 0 < r < 1$, there exists a positive number $N$ such that $M(x_n,x_m) > (1-r)$, for each $m, n \geq N$.

Proposition 1.18:[1] Let $(X,d)$ be an ordinary metric space and let $a\ast b = a.b$ for all $a, b \in [0,1]$. Define $M_{d}(x,y) = \frac{1}{1+d(x,y)}$, then $(X,M_{d},\ast)$ is a standard fuzzy metric space and it is called the standard fuzzy metric induced by the metric $d$.

Proposition 1.19:[1] Let $(X,d)$ be a metric space and let $(X,M_{d},\ast)$ be the standard fuzzy metric space induced by $d$.

Let $(x_n)$ be a sequence in $X$. Then $(x_n)$ converges to $x \in X$ in $(X,d)$ if and only if $(x_n)$ converges to $x$ in $(X,M_{d},\ast)$.

Proposition 1.20:[1] Let $(X,d)$ be a metric space and let $M_{d}(x,y) = \frac{1}{1+d(x,y)}$. Then $(X,d)$ is a Cauchy sequence in $(X,d)$ if and only if $(x_n)$ is a Cauchy sequence in $(X,M_{d},\ast)$.

Definition 1.21:[1] Let $(X,M,\ast)$ be a standard fuzzy metric space. A subset $A$ of $X$ is said to be F-bounded if there
exists \( 0 < r < 1 \) such that, \( M(x,y) > 1 - r \), for all \( x, y \in A \).

**Proposition 1.22:**[1] Let \((X,d)\) be a metric space and let \( M_d(x,y) = \frac{1}{1+d(x,y)} \) then a subset \( A \) of \( X \) is \( F \)-bounded if and only if it is bounded.

**Definition 1.23:**[1] A standard fuzzy metric space \((X,M,\ast)\) is complete if every Cauchy sequence in \( X \) converges to a point in \( X \).

**Definition 1.24:**[1] Let \((X,M_X,\ast)\) and \((Y,M_Y,\ast)\) be standard fuzzy metric spaces and \( A \subseteq X \). A function \( f:A \rightarrow Y \) is said to be continuous at \( a \in A \), if for every \( 0 < \varepsilon < 1 \), there exist some \( 0 < \delta < 1 \), such that \( M_Y(f(x),f(a)) > (1 - \varepsilon) \) whenever \( x \in A \) and \( M_X(x,a) > (1 - \delta) \). If \( f \) is continuous at every point of \( A \), then it is said to be continuous on \( A \).

**Theorem 1.25:**[1] Let \((X,M_X,\ast)\) and \((Y,M_Y,\ast)\) be standard fuzzy metric spaces and \( A \subseteq X \). A function \( f:A \rightarrow Y \) is continuous at \( a \in A \) if and only if whenever a sequence \((x_n)\) in \( A \) converge to \( a \), the sequence \((f(x_n))\) converges to \( f(a) \).

**Theorem 1.26:**[1] A function \( f:X \rightarrow Y \) is continuous on \( X \) if and only if \( f^{-1}(G) \) is open in \( X \) for all open subset \( G \) of \( Y \).

**Theorem 1.27:**[1] A mapping \( f:X \rightarrow Y \) is continuous on \( X \) if and only if \( f^{-1}(F) \) is closed in \( X \) for all closed subset \( F \) of \( Y \).

**Lemma 1.28:**[1] Let \( A \) be a subset of a standard fuzzy metric space \((X,M,\ast)\) then \( a \in \overline{A} \) if and only if there is a sequence \((a_n)\) in \( A \) such that \( a_n \rightarrow a \).

**Theorem 1.29:**[1] Let \( A \) be a subset of a standard fuzzy metric \((X,M,\ast)\) then \( A \) is dense in \( X \) if and only if for every \( x \in X \) there is \( a \in A \) such that \( M(x,a) > 1 - \varepsilon \) for some \( 0 < \varepsilon < 1 \).

**Definition 1.30:**[4] Let \((X,M_X,\ast)\) and \((Y,M_Y,\ast)\) be any two standard fuzzy metric spaces. A mapping \( f:X \rightarrow Y \) which is both one-to-one and onto is said to be a homeomorphism if and only if the mapping \( f \) and \( f^{-1} \) are continuous on \( X \) and \( Y \), respectively. Two standard fuzzy metric spaces \( X \) and \( Y \) are said to be homeomorphic if and only if there exists a homeomorphism of \( X \) onto \( Y \), and in this case, \( Y \) is called a homeomorphic image of \( X \).

**Remark 1.31:**[4] If \( X \) and \( Y \) are homeomorphic, the homeomorphism puts their points in one-to-one correspondence in such a way that their open sets also correspond to one another. For standard fuzzy metric space \( X \) and \( Y \), let \( X \sim Y \) means that \( X \) and \( Y \) are homeomorphic. It is easily verified that the relation is reflexive, symmetric and transitive.

**Definition 1.32:**[4] A mapping \( f \) from a standard fuzzy metric space \((X,M_X,\ast)\) into a standard fuzzy metric space \((Y,M_Y,\ast)\) is an \( F \)-isometry if \( M_Y(f(x),f(y)) = M_X(x,y) \) for all \( x, y \in X \). It is obvious that an \( F \)-isometry is one-to-one and uniformly continuous. \( X \) and \( Y \) are said to be \( F \)-isometric if there exists an \( F \)-isometry between them that is onto. An \( F \)-isometry is necessarily a homeomorphism but the converse is not true.

**Proposition 1.33:**[4] Let \((X,d)\) be a metric space and let \((X, M_d, \ast)\) be the induced standard fuzzy metric space.

Let \((Y,d)\) be another metric space and let \((Y, N_d, \ast)\) be the induced standard fuzzy metric space. Let \( f:X \rightarrow Y \) be a mapping then \( f \) is isometry if and only if \( f \) is \( F \)-isometry.

**Theorem 1.34:**[4] Let \( A \) be a dense subset of a standard fuzzy metric space \((X,M,\ast)\). If every Cauchy sequence of point of \( A \) converges in \( X \) then \((X,M,\ast)\) is complete.

**Proof:** Let \((x_n)\) be a Cauchy sequence in \( X \), since \( A \) is dense then for every \( x_n \in X \) there is \( a_n \in A \) such that \( M(x_n, a_n) > 0 \)
(1- s) for some 0 < s < 1 by Theorem 1.29 Then by Remark 1.2 there is (1- ε)∈(0,1) such that

(1- s) * (1- s) ≥ (1- ε).

Since (xₙₙ) is Cauchy so (aₙₙ) is Cauchy so aₙ→x by assumption. Now M(xₙₙ, x) ≥ M(xₙₙ, aₙₙ) * M(aₙₙ, x) ≥

(1- s) * (1- s) ≥ (1- ε). Hence xₙₙ→x. 

**Definition 1.35:** Let (X,M,*) be a standard fuzzy metric space. A completion of (X,M,*) is a complete standard fuzzy metric space (Y,N,*) such that (X,M,*) is F-isometric to a dense subset of Y.

In [4] it was presented the following example of a standard fuzzy metric space that is not completatable.

**Example 1.36:** Let a*b = max{0, a + b - 1} for all a, b∈[0,1]. Now let {xₙₙ: n = 3, 4, 5,...,∞} and {yₙₙ: n = 3, 4,...,∞} be two sequences of distinct points such that A∩B = Ø where A= {xₙₙ: n ≥ 3} and B = {yₙₙ: n ≥ 3}. Put X = A∪B, define M : X×X→[0,1] as follows : M(xₙₙ, xₙₙ) = M(yₙₙ, yₙₙ) = 1 - [1/n∧m - 1/n∨m]Where n∧m = min(n,m) and n∨m = max(n,m). M(xₙₙ, yₙₙ) = M(yₙₙ, xₙₙ) = 1/n + 1/m

It was shown that (X,M,*) is a standard fuzzy metric space and (X,M,*) is not completatable.

**Definition 1.37:** A standard fuzzy metric space (X,M,*) is called completatable if it admits a completion.

**Theorem 1.38:** Every completatable standard fuzzy metric space admits a completion.

2. STANDARD FUZZY QUAS-METRIC SPACE

**Definition 2.1:** The triple (X,M,*) is called a standard fuzzy quasi-metric space where X is a nonempty set, * is a continuous t-norm and M is a fuzzy set on X×X satisfying the following conditions:

1) For all x, y∈X, M(x,y) > 0
2) M(x,y) = M(y,x) = 1 if and only if x = y
3) M(x,y) * M(y,z) ≤ M(x,z) for all x, y, z∈X
4) M is a continuous fuzzy set

**Proposition 2.2:** If (X,M,*) is a standard fuzzy quasi-metric space then define M⁻¹ : X×X→[0,1] by : M⁻¹⁻¹(x,y) = M⁻¹(x,y) for all x, y∈X.

Then (X, M⁻¹,*) is a standard fuzzy quasi-metric space.

**Proof:** (1) M⁻¹⁻¹(x,y) > 0 since M(x,y) > 0 for all x, y∈X

(2) M⁻¹⁻¹(x,y) = 1 if and only if M(y,x) = 1 = M(x,y) ⇔ y = x

(3) M⁻¹⁻¹(x,y) * M⁻¹⁻¹(y,z) = M(x,y) * M(z,y)

= M(z,y) * M(y,x)

≤ M(z,x) = M⁻¹⁻¹(x,z)

(4) M⁻¹ is continuous since M is continuous.

Therefore (X, M⁻¹,*) is a standard fuzzy quasi-metric space.
**Proposition 2.3:** Let \((X,M,\ast)\) be a standard fuzzy quasi-metric space. Define \(G:X \times X \to [0,1]\) by: 
\[
G(x,y) = \min \{M(x,y), M^{-1}(x,y)\}.
\]
Then 
\[(X,G,\ast)\] is a standard fuzzy space. We shall refer to \((X,G,\ast)\) as the standard fuzzy metric induced by \((X,M,\ast)\).

**Proof:** It is sufficient to show that \(G(x,y) = G(y,x)\) for each \(x, y \in X\). If \(G(x,y) = M(x,y)\) then \(G(y,x)\) must equal to \(M^{-1}(y,x)\) but \(M^{-1}(y,x) = M(x,y)\) that is \(G(x,y) = M(x,y)\). Hence \(G(x,y) = G(y,x)\). Similarly if \(G(x,y) = F(x,y)\) then \(G(x,y) = G(y,x)\).

Therefore \((X,G,\ast)\) is a standard fuzzy metric space.

**Proposition 2.4:** Let \((X,M,\ast)\) be a standard fuzzy quasi-metric space. Then 
\[
\tau_M = \{A \subseteq X : a \in A \iff \exists r, 0 < r < 1, \text{ such that} \quad B(a,r) \subseteq A\}
\]
is a topology on \(X\).

**Proof:** The proof is similar to the proof of Theorem 1.13, hence is omitted.

**Example 2.5:** Let \((X,d)\) be an ordinary quasi-metric space and let \(M_d\) be the function defined on \(X \times X\) to \([0,1]\) by: 
\[
M_d(x,y) = \frac{1}{1 + d(x,y)}.
\]
Then for each continuous \(t\)-norm \(\ast\), \((X,M_d,\ast)\) is a standard fuzzy quasi-metric space which is called the standard fuzzy induced by the quasi-metric \(d\). Furthermore, it is easy to check that \((M_d)^{-1} = M_d^{-1}\) and 
\[
G_d = M_d^\ast \quad \text{where} \quad d^{-1}(x,y) = d(y,x), \quad d^\ast(x,y) = \max\{d(x,y), d^{-1}(x,y)\}, \quad G_d(x,y) = \min\{M_d(x,y), M_d^{-1}(x,y)\}.
\]

**Definition 2.6:** A standard fuzzy quasi-metric space \((X,M,\ast)\) is called bicomplete if \((X,G,\ast)\) is a complete standard fuzzy metric space.

**Definition 2.7:** Let \((X,M,\ast)\) be a standard fuzzy quasi-metric space. A bicompletion of \((X,M,\ast)\) is a bicomplete standard fuzzy quasi-metric space \((Y,N,\ast)\) such that \((X,M,\ast)\) is \(F\)-isometric to a dense subset of \(Y\).

**Lemma 2.8:** Let \((X,M,\ast)\) be a standard fuzzy quasi-metric space. Denote by \(S\) the collection of all Cauchy sequence in \((X,G,\ast)\).

Define a relation \(\sim\) on \(S\) by \((x_n) \sim (\hat{x}_n)\) if and only if \(\lim G(x_n,\hat{x}_n) = 1\), where by \(\lim G(x_n,\hat{x}_n)\) we denote the lower limit of the sequence \((G(x_n,\hat{x}_n))\) i.e. 
\[
\lim G(x_n,\hat{x}_n) = \sup \inf_{k \geq k} G(x_n,\hat{x}_n).
\]
Then \(\sim\) is an equivalence relation on \(S\).

**Proof:** 1- \(\sim\) is reflexive because \(G(x_n,x_n) = 1\) for all \(n \in \mathbb{N}\) so \((x_n) \sim (x_n)\)

2- If \((x_n) \sim (y_n)\), it immediately follows that \((y_n) \sim (x_n)\) because 
\[
G(x_n,y_n) = G(y_n,x_n) \quad \text{for all} \quad n \in \mathbb{N}, \quad \text{So that} \quad \lim G(y_n,x_n) = \lim G(x_n,y_n) = 1
\]

3- \(\sim\) is transitive, suppose that \((x_n) \sim (y_n)\) and \((y_n) \sim (z_n)\). We shall prove \(\lim G(x_n,z_n) = 1\). Since \((x_n) \sim (y_n)\) then \(\lim G(x_n,y_n) = 1\).

Also \((y_n) \sim (z_n)\) so \(\lim G(y_n,z_n) = 1\) for all \(n \in \mathbb{N}\).

Now \(G(x_n,z_n) \geq G(x_n,y_n) \ast G(y_n,z_n)\)

**ISSN 2347-1921**
\[
\lim G(x_n, z_n) \geq \lim G(x_n, y_n) \ast \lim G(y_n, z_n)
\]

Hence \( \lim G(x_n, z_n) = 1 \]

**Lemma 2.9:** Define \( M_S((x_n), (y_n)) = \lim M(x_n, y_n) \) for all \((x_n), (y_n) \in S\) where \( M_S : S \times S \to [0,1] \). Then \( M_S \) satisfies 1, 3 and 4 of Definition 2.1.

**Proof:** 1- \( M_S((x_n), (y_n)) > 0 \) because \( M(x_n, y_n) > 0 \) so, \( \lim M(x_n, y_n) > 0 \).

3- Let \((x_n), (y_n), (z_n) \in S\) and put \( \alpha = M_S((x_n), (y_n)), \beta = M_S((y_n), (z_n)) \) and \( \gamma = M_S((x_n), (z_n)) \). We shall show that \( \alpha \ast \beta \leq \gamma \). If \( \alpha = 0 \) or \( \beta = 0 \) the conclusion is obvious. So we assume that \( \alpha > 0 \) and \( \beta > 0 \). Choose an arbitrary \( \varepsilon \in (0, \min\{\alpha, \beta\}/2) \). Then \( (\alpha - \varepsilon) < M_S((x_n), (y_n)) \) and \( (\beta - \varepsilon) < M_S((y_n), (z_n)) \). Furthermore, there exists \( N_\varepsilon \) such that for all \( k \geq N_\varepsilon \)

\[
M_S((x_n), (y_n)) - \varepsilon < M(x_k, y_k) \quad \text{and} \quad M_S((y_n), (z_n)) - \varepsilon < M(y_k, z_k)
\]

Then \( (\alpha - 2\varepsilon) \ast (\beta - 2\varepsilon) \leq [M_S((x_n), (y_n)) - \varepsilon] \ast [M_S((y_n), (z_n)) - \varepsilon] \)

\[
\leq M(x_k, y_k) \ast M(y_k, z_k)
\]

\[
\leq M(x_k, z_k) \quad \text{for all} \quad k \geq N_\varepsilon
\]

Therefore \( (\alpha - 2\varepsilon) \ast (\beta - 2\varepsilon) \leq \inf_{k \geq N_\varepsilon} M(x_k, z_k) \)

\[
\leq \lim \inf M(x_n, z_n) = \gamma
\]

By continuity of \( \ast \), it follows that \( \alpha \ast \beta \leq \gamma \).

4- \( M_S \) is continuous because \( M \) is continuous.

**Notation 2.10:** We denote the quotient \( S/\sim \) by \( \overline{S}/\sim \) and \( [(x_n)] \) the class of the element \( (x_n) \) of \( S \).

**Lemma 2.11:** If \( (x_n) \sim (a_n) \) and \( (y_n) \sim (b_n) \) then \( M_S((x_n), (y_n)) = M_S((a_n), (b_n)) \).

**Proof:** \( M_S((x_n), (y_n)) \geq M_S((a_n), (a_n)) \ast M_S((b_n), (b_n)) \ast M_S((a_n), (b_n)) \ast M_S((a_n), (b_n)) \)

Thus \( M_S((x_n), (y_n)) \geq M_S((a_n), (b_n)) \). Now

\[
M_S((a_n), (b_n)) \geq M_S((x_n), (y_n)) \ast M_S((x_n), (y_n)) \ast M_S((y_n), (y_n))
\]

\[
= M_S((x_n), (y_n))
\]

So, \( M_S((a_n), (b_n)) \geq M_S((x_n), (y_n)) \). Therefore \( M_S((x_n), (y_n)) = M_S((a_n), (b_n)) \).

**Definition 2.12:** For each \( [(x_n)], [(y_n)] \in \overline{S} \) define \( \overline{M}([(x_n)], [(y_n)]) = M_S((x_n), (y_n)) \). Then \( \overline{M} \) is a function from \( \overline{S} \times \overline{S} \) to \([0,1]\) and it is well defined by Lemma 2.11. Also we define \( T:X \to \overline{S} \) such that for each \( x \in X \), \( T(x) \) is the class of constant sequence \( x, x, \ldots \).

Now, from the above construction we obtain the main result in this section.
Theorem 2.13: Let \((X, M, \ast)\) be a standard fuzzy quasi-metric space.

(a) \((\bar{X}, \bar{M}, \ast)\) is a standard fuzzy quasi-metric space

(b) \(T(X)\) is dense in \((\bar{X}, \bar{M}, \ast)\)

(c) \((X, M, \ast)\) is \(F\)-isometry to \((T(X), \bar{M}, \ast)\)

(d) \((\bar{X}, \bar{M}, \ast)\) is bicomplete

Proof (a): \(\bar{M}\) satisfies conditions 1, 3 and 4 of Definition 2.1 as an immediate consequence of Lemma 2.9. Now, let \((x_n), (y_n)\) \(\in S\) such that \(\bar{M}([x_n], [y_n]) = 1\). If \((z_n) \in ([y_n])\) it follows that from Lemma 2.11 that \(\bar{M}_s((z_n), (y_n)) = 1\). The same argument shows that \((z_n) \in ([x_n])\) implies that \(\bar{M}_s((z_n), (x_n)) = 1\). We conclude that \(\bar{M}([x_n], [y_n]) = 1\) if and only if \([x_n] = [y_n]\). Hence \((\bar{X}, \bar{M}, \ast)\) is a standard fuzzy quasi-metric space.

Proof (b): Let \((x_n) \in S\) and \(0 < \varepsilon < 1\). Since \((x_n)\) is Cauchy sequence in \((X, M, \ast)\) then there is \(N_\varepsilon\) such that \(M(x_{k}, x_{N_\varepsilon}) < 1 - \varepsilon / 2\) for all \(k \geq N_\varepsilon\).

Thus \(\bar{M}((x_n), T(x_{N_\varepsilon})) = \bar{M}_s((x_n), T(x_{N_\varepsilon}))\)

\[\geq \inf_{k \geq N_\varepsilon} M(x_{k}, x_{N_\varepsilon})\]

\[\geq 1 - \varepsilon / 2 > 1 - \varepsilon\]

We have shown that \(T(X)\) is dense in \((\bar{X}, \bar{M}, \ast)\).

Proof (c): This is almost obvious because for each \(x, y \in X\), we have \(\bar{M}(T(x), T(y)) = M(x, y)\).

Proof (d): Let \(G([x_n]), ([y_n]) = \min \{ \bar{M}(([x_n]), ([y_n])), \bar{M}^{-1}(([x_n]), ([y_n])) \}\)

Let \((\tilde{x}_n)\) be a Cauchy sequence in \(\tilde{X}\), \(G, \ast\), then there is an increasing sequence \((n_k)\) in \(N\) such that \(G(\tilde{x}_n, \tilde{x}_m) > (1 - 2^{-k})\) for all \(n, m \geq n_k\). Since \(T(X)\) is dense in \(\tilde{X}\), \(G, \ast\) then for each \(k \in N\) there is \(y_k \in X\) such that \(G(\tilde{x}_{n_k}, T(y_k)) > (1 - 2^{-k})\) for all \(k \in N\). We show that \((y_k)\) is a Cauchy sequence in \((X, G, \ast)\). To this end, choose \(0 < \varepsilon < 1\). Take \(j \in N\) such that \((1 - 2^{-j}) \ast (1 - 2^{-j}) > (1 - \varepsilon)\). Then for each \(k, m \geq j\), we have

\[M(y_k, y_m) = \bar{M}(T(y_k), T(y_m))\]

\[\geq \bar{M}(T(y_k), \tilde{x}_{n_k}) \ast \bar{M}(\tilde{x}_{n_k}, \tilde{x}_{m_k}) \ast \bar{M}(\tilde{x}_{m_k}, T(y_m))\]

\[\geq (1 - 2^{-k}) \ast (1 - 2^{-(k+m)}) \ast (1 - 2^{-m})\]

\[\geq (1 - 2^{-k}) \ast (1 - 2^{-j}) \ast (1 - 2^{-j}) > (1 - \varepsilon)\]

And consequently \((y_k)\) is a Cauchy sequence in \((X, G, \ast)\). Therefore \(\tilde{Y} = [y_k]\), where \(\tilde{Y} = [y_k]\). Finally, we prove that \((\tilde{x}_n)\) converges to \(\tilde{Y}\) in \((\tilde{X}, G, \ast)\).
Indeed, as in part (c) choose $0 < \varepsilon < 1$. Take $j \in \mathbb{N}$ such that

$$(1 - 2^{-j}) \ast (1 - 2^{-j}) \ast (1 - 2^{-j}) > (1 - \varepsilon)$$

Since $(y_k)$ is a Cauchy sequence in $(X, \mathcal{G}, \ast)$, the proof of part (b) shows that there is $k \geq j$ such that $\mathcal{G}(y_k, T(y_k)) > (1 - 2^{-j})$

Then for $n \geq n_k$, we obtain

$$\mathcal{G}(\tilde{y}_n, \tilde{x}_n) \geq \mathcal{G}(y_k, T(y_k)) \ast \mathcal{G}(T(y_k) \tilde{x}_n) \ast \mathcal{G}(\tilde{x}_n, \tilde{x}_n)$$

$$\geq (1 - 2^{-j}) \ast (1 - 2^{-k}) \ast (1 - 2^{-j})$$

$$\geq (1 - 2^{-j}) \ast (1 - 2^{-j}) \ast (1 - 2^{-j}) > (1 - \varepsilon)$$

We conclude that $(\tilde{X}, \tilde{M}, \ast)$ is bicomplete.

**Definition 2.14:**

A standard fuzzy quasi-metric space $(X, M, \ast)$ is called bicomplete if it admits a bicompletion.

**Theorem 2.15:**

Let $(X, M, \ast)$ be a standard fuzzy quasi-metric space and let $(Y, N, \ast)$ be a bicomplete standard fuzzy quasi-metric space.

If there is an $F$-isometry mapping $f$ from a dense subset $A$ of $X$ to $Y$ then $f$ has a unique extension $\tilde{f}^*: X \rightarrow Y$.

**Proof:** We consider any $x \in X$ but $x = \overline{A}$ so $\overline{A}$ then there is a sequence $(x_n)$ in $A$ such that $(x_n)$ converges to $x$ by Lemma 1.28. Then $(x_n)$ is Cauchy. Since $f$ is $F$-isometry $(f(x_n))$ is Cauchy in $Y$ but $Y$ is complete hence there is $y \in Y$ such that $(f(x_n))$ converges to $y$. Now we define $\tilde{f}^*(x) = y$. We now show that this definition is independent of the particular choice of the sequence in $A$ converging to $x$. Suppose that $(x_n)$ in $A$ converges to $x$ and $(z_n)$ in $A$ converges to $x$. Then $(V_m)$ converges to $x$ where $(V_m) = x_1, z_1, x_2, z_2, \ldots$. Hence $(f(V_m))$ converges and the two subsequence $(f(V_m))$ and $(f(z_n))$ must have the same limit. This prove $\tilde{f}^*$ is uniquely defined at every $x \in X$. Clearly $\tilde{f}^*(x) = f(x)$ for every $x \in A$ so that $\tilde{f}^*$ is an extension of $f$.

**Theorem 2.16:** Let $(X, M, \ast)$ be a standard fuzzy quasi-metric space and let $(Y, N, \ast)$ be a bicomplete standard fuzzy quasi-metric space.

If $f$ is an $F$-isometry mapping from a dense subset $A$ of $X$ to $Y$ then the unique extension $\tilde{f}^*: X \rightarrow Y$ is an $F$-isometry.

**Proof:** Let $x, y \in X$ then there exists two sequences $(x_n)$ and $(y_n)$ in $A$ such that $x_n \rightarrow x$ and $y_n \rightarrow y$. Choose an arbitrary $0 < \varepsilon < 1$. Now: $\varepsilon + M(x, y) > M(x, y)$. Furthermore, it follows that $(x_n)$ and $(y_n)$ are Cauchy sequences in $A$ so

$(\tilde{f}^*(x_n))$ and $(\tilde{f}^*(y_n))$ are Cauchy sequences in $Y$. But $Y$ is complete hence $(\tilde{f}^*(y_n))$ converges to $\tilde{f}^*(y)$ and $(\tilde{f}^*(x_n))$ converges to $\tilde{f}^*(x)$. Then there is a positive integer $N$ such that $M(x, x_n) > (1 - \varepsilon)$, $M(y, y_n) > (1 - \varepsilon)$

$N(\tilde{f}^*(x_n), \tilde{f}^*(y_n)) > (1 - \varepsilon)$ and $N(\tilde{f}^*(y_n), \tilde{f}^*(y)) > (1 - \varepsilon)$ for all $n \geq N$

Thus we have

$$\varepsilon + M(x, y) > M(x, y)$$

Thus we have

$$\geq M(x, x_n) \ast M(x_n, y_n) \ast M(y, y_n)$$
\[ (1 - \varepsilon) \ast N(f^n(x_n), f^n(y_n)) \ast (1 - \varepsilon) \]

But
\[ N(f^n(x_n), f^n(y_n)) \geq N(f^n(x), f^n(x)) \ast N(f^n(y), f^n(y)) \ast N(f^n(y), f^n(y)) \]
\[ \geq (1 - \varepsilon) \ast N(f^n(x), f^n(y)) \ast (1 - \varepsilon) \text{ for all } n \geq N. \]

Therefore \( \varepsilon + M(x, y) \geq (1 - \varepsilon) \ast (1 - \varepsilon) \ast N(f^n(x), f^n(y)) \ast (1 - \varepsilon) \ast (1 - \varepsilon) \)

By continuity of \( \ast \) and \( \ast \) it follows that \( M(x, y) \geq N(f^n(x), f^n(y)) \)

A similar argument shows that \( N(f^n(x), f^n(y)) \geq M(x, y) \) for all \( x, y \in X \)

We conclude that \( f^* \) is an \( F \)-isometry from \((X, M, \ast) \) to \((Y, N, \ast) \)

**Theorem 2.17**: Every bicompletable standard fuzzy quasi-metric space admits a unique [up to \( F \)-isometry] bicompletion.

**Proof**: Let \((Y, M_1, \ast)\) and \((Z, M_2, \circ)\) be two bicompletions of \((X, M, \ast)\) then we will prove that \((Y, M_1, \ast)\) and \((Z, M_2, \circ)\) are \( F \)-isometric. Since \((Y, M_1, \ast)\) is a bicompletion of \((X, M, \ast)\) then there is an \( F \)-isometry \( f \) from \((X, M, \ast)\) to a dense subset of \((Y, M_1, \ast)\). By Theorem 2.15 and Theorem 2.16 \( f \) admits a unique extension \( f^* \) onto \((Y, M_1, \ast)\) which is also an \( F \)-isometry. Similarly \( f^* \) is an isometry extension \((X, M, \ast)\) onto \((Z, M_2, \circ)\). To prove that \( f^* \) and \( f \) are \( F \)-isometric it remains to see that \( f^* \) and \( f \) are onto we will show that \( f^* \) is onto. Indeed given \( y \in Y \) there is a sequence \((x_n)\) in \( X \) such that \( f^*(x_n) \to y \). Since \( f^* \) is an \( F \)-isometry \((X, M, \ast)\) is a Cauchy sequence, so it converges to some point \( x \in X \). Consequently \( f^*(x) = y \). Similarly we can prove that \( f \) is onto. Hence \( f^* \) and \( f \) are \( F \)-isometric. Now \((Y, M_1, \ast)\) is \( F \)-isometric to \((X, M, \ast)\) and \((X, M, \ast)\) is \( F \)-isometric to \((Z, M_2, \circ)\). Hence \((Y, M_1, \ast)\) is \( F \)-isometric to \((Z, M_2, \circ)\).
