Received 23 December 2014

Abstract
This paper studies the problem to construct a spacelike developable surface possessing a given non-null parametric curve as the line of curvature in Minkowski 3-space. By using Frenet frame to express the surface, we derive the necessary and sufficient conditions when the resulting spacelike developable surface is cylinder, cone or tangent surface. Finally, we give some representative examples.

Key words: Spacelike developable surface, Line of curvature, Frenet frame

1. Introduction

In $E^3$ (Euclidean 3-space), developable surfaces are a subset of ruled surfaces. They can be developed onto a plane without stretching and tearing. Therefore, they have important application in many product design which use leather, paper, sheet metal as materials. There are three types of developable surfaces: cylinders, cones and tangent surfaces.

There are mainly two methods for the design of developable surfaces. One approach is to prove characterizing equations for the free form surfaces to be developable. The readers can refer to papers (Nolan, 1971, Aumann, 1991, Chalfant and Maekawa, 1998). However, the complex system of coupled equations is very difficult for the design of developable Bézier surfaces in a CAD system. Another approach to design developable surfaces is a direct surface represented in terms of geometric duality between points and planes in 3D projective space by Chu and Séquin (Chu and Séquin, 2002). In paper (Bodduluri and Ravani, 1993), the concept of duality between points and planes in 3D projective space was used to develop a new representation for developable surfaces in terms of plane geometry.

Line of curvature is one of the most important characteristic curve on a surface and it plays an important role in differential geometry, please refer to the book by Carmo (1976) and Willmore (1959). It is a useful tool in surface analysis for exhibiting variations of the principal direction. There are a number of papers studied the lines of curvature. Martin (Martin, 1983) introduced the principal patches whose sides are lines of curvature. He showed that the existence of such patches was contingent upon certain position matching and frame matching conditions along the patch boundary curves. Alourdas et al. (Alourdas, et al., 1990) studied how to construct a net of lines of curvature on a B-spline surface. In paper (Li, et al., 2011), the authors studied the parametric surface pencils which possess the given curve as the line of curvature. Moreover, the authors further gave an approach to design the developable surface through the given curve as line of curvature in paper (Li, et al., 2013).

As we all know, Minkowski geometry provides the theoretical model in mathematics for Einstein’s relativity theory. Especially, $E^3_1$ (Minkowski 4-space) has the very strong physical background. As the sub-space of $E^3_1$, $E^3$ (Minkowski 3-space) has many properties which are different from $E^3$. Some basic concepts, such as vector, frame, and the motion of point, have qualitative changes. Since the metric in $E^3_1$ is Lorentzian metric which is not positive definite metric. The distance function in $E^3_1$ can be positive, negative or zero. Therefore, the vectors in $E^3_1$ can be classified into three types: spacelike vectors, timelike vectors and lightlike vectors according to the sign of the distance function. Especially,
the emergence of lightlike vectors makes the results of some problems are surprising. As the spatio-temporal model of relativity theory, Minkowski space obtains much attention in the field of mathematics and physics. The theory of submanifold in Minkowski space has been an important topic in the field of geometry. In this paper, we continue the research of the paper (Li, et al., 2013). We give an approach to design the spacelike developable surface which possess the given curve as line of curvature, and we also derive the necessary and sufficient conditions for the spacelike developable surface to be cylinder, cone or tangent surface respectively.

The paper is organized as follows. In Section 2, we briefly recall the relevant definitions and results about curve and surface of Differential Geometry in $E_1^3$. In Section 3, for a given non-null parametric curve $\mathbf{r}(s)$, where $s$ is arc-length parameter, we construct a spacelike developable surface which possesses $\mathbf{r}(s)$ as the line of curvature and give the concrete expression of the resulting surface. Moreover, we derive the conditions when the developable surface is cylinder, cone or tangent surface respectively. Some representative examples are given in Section 4. Finally, we conclude the paper in Section 5.

2. Backgrounds

2.1. Curves and surfaces in Minkowski 3-space

Definition 1 (Lopez, 2008) The Lorentz-Minkowski space is the metric space $E_1^3 = (R^3, <, >)$, where the metric $<, >$ is given by

$$< \mathbf{u}, \mathbf{v} > = u_1v_1 + u_2v_2 - u_3v_3, \quad \mathbf{u} = (u_1, u_2, u_3), \mathbf{v} = (v_1, v_2, v_3).$$  \hspace{1cm} (1)

The metric $<, >$ is called the Lorentzian metric.

Definition 2 (Lopez, 2008) A vector $\mathbf{v} \in E_1^3$ is called

(1) spacelike if $< \mathbf{v}, \mathbf{v} > > 0$ or $\mathbf{v} = 0$,

(2) timelike if $< \mathbf{v}, \mathbf{v} >= 0$ and

(3) lightlike if $< \mathbf{v}, \mathbf{v} >= 0$ and $\mathbf{v} \neq 0$.

We point out that the null vector $\mathbf{v} = 0$ is considered of spacelike type although it satisfies $< \mathbf{v}, \mathbf{v} >= 0$.

The definition of vector product is the same as the given one in the Euclidean ambient.

Definition 3 (Lopez, 2008) If $\mathbf{u}, \mathbf{v} \in E_1^3$, we call the Lorentzian vector product of $\mathbf{u}$ and $\mathbf{v}$ to the unique vector denoted by $\mathbf{u} \times \mathbf{v}$ that satisfies

$$< \mathbf{u} \times \mathbf{v}, \mathbf{w} >= det(\mathbf{u}, \mathbf{v}, \mathbf{w}),$$

where $det(\mathbf{u}, \mathbf{v}, \mathbf{w})$ is the determinant of the matrix obtained by putting by columns the coordinates of the three vectors $\mathbf{u}, \mathbf{v}$ and $\mathbf{w}$.

For any two vectors $\mathbf{u} = (u_1, u_2, u_3)$ and $\mathbf{v} = (v_1, v_2, v_3)$, the vector product is defined by $\mathbf{u} \times \mathbf{v} = (u_2v_3 - u_3v_2, u_3v_1 - u_1v_3, -(u_1v_2 - u_2v_1)).$

Let $\mathbf{r}(s)$ be a curve in $E_1^3$, where $s$ is the arc-length parameter. We say that $\mathbf{r}(s)$ is spacelike (resp. timelike, lightlike) at $s$ if $\mathbf{r}(s)$ is a spacelike (resp. timelike, lightlike) vector. In this paper, $\mathbf{r}(s)$ denote the derivatives of $\mathbf{r}$ with respect to arc length parameter $s$. The curve $\mathbf{r}(s)$ is called spacelike (resp. timelike, lightlike) if it is for any $s \in I$.

We suppose that $\mathbf{r}(s)$ be a unit speed timelike curve in $E_1^3$. Let $k(s)$ and $\tau(s)$ be the curvature and torsion. Assume $\dot{r}(s) \neq 0$ for all $s \in [0, L]$, since this would give us a straight line. For each point of $\mathbf{r}(s)$, the corresponding Serret-Frenet formulae is given by (Wallace 1995):

$$\mathbf{T}(s) = k(s)\mathbf{N}(s), \hspace{1cm} (2)$$

$$\mathbf{N}(s) = k(s)\mathbf{T}(s) + \tau(s)\mathbf{B}(s), \hspace{1cm} (3)$$

$$\mathbf{B}(s) = -\tau(s)\mathbf{N}(s), \hspace{1cm} (4)$$

and

$$\mathbf{T}(s) \times \mathbf{N}(s) = \mathbf{B}(s), \mathbf{T}(s) \times \mathbf{B}(s) = -\mathbf{N}(s), \mathbf{N}(s) \times \mathbf{B}(s) = -\mathbf{T}(s).$$ \hspace{1cm} (5)

If $\mathbf{r}(s)$ is a unit speed spacelike curve, the Serret-Frenet formulae are as follows:
(1) $N(s)$ is spacelike and $B(s)$ is timelike
$$T(s) = k(s)N(s),$$
$$N(s) = -k(s)T(s) + \tau(s)B(s),$$
$$B(s) = \tau(s)N(s),$$
and
$$T(s) \times N(s) = -B(s),$$
$$T(s) \times B(s) = N(s),$$
$$N(s) \times B(s) = T(s).$$

(2) $N(s)$ is timelike and $B(s)$ is spacelike
$$T(s) = k(s)N(s),$$
$$N(s) = k(s)T(s) + \tau(s)B(s),$$
$$B(s) = \tau(s)N(s),$$
and
$$T(s) \times N(s) = B(s),$$
$$T(s) \times B(s) = N(s),$$
$$N(s) \times B(s) = T(s).$$

Here $N(s)$ and $B(s)$ are called the normal vector and the binormal vector respectively.

For a parametric surface $P(s,t)$, it is called a spacelike (timelike) if the induced metric on $P(s,t)$ is a Riemannian (Lorentzian) metric on each tangent plane. That is to say, the unit normal vector $n(s,t)$ of the surface $P(s,t)$ is timelike (spacelike) on each point of $P(s,t)$, where
$$n(s,t) = \frac{P_s(s,t) \times P_t(s,t)}{|P_s(s,t) \times P_t(s,t)|}.$$  

2.2. Ruled surface

Ruled surface is the well-known geometric object. Extending the research of ruled surface from $E^3$ to $E^3_1$, and studying its geometric properties is an important issue. De Woestijne (de Woestijne, 1990) classified all ruled surfaces in $E^3_1$. Kim and Yoon (Kim and Yoon, 2004) classified the ruled surfaces satisfying Gauss map conditions in $E^3_1$.

Now, we define a ruled surface $M$ in $E^3_1$. Let $\alpha = \alpha(s)$ be a curve defined on an open interval $I_1$ of $R$ and $\beta = \beta(s)$ be a transversal vector field along $\alpha$. For an open interval $I_2$ of $R$, we have the parametrization for $M$
$$P(s,t) = \alpha(s) + t\beta(s), \quad s \in I_1, t \in I_2,$$
where $\alpha(s)$ is called a base curve and $\beta(s)$ a director curve.

For non-developable ruled surface (15) in $E^3_1$, if $<\alpha',\beta'> \neq 0$ and $<\alpha',\beta'> = 0$, then the ruled surface (15) is said to be of type $M^1_1(M^2_1)$.

(1) If $<\alpha',\alpha' > < 0$ and $< \beta,\beta' > 1$, when $< \beta,\beta' > 0(< \beta,\beta' > 0)$, the ruled surface (15) is said to be type $M^1_1(M^2_1)$.

(2) If $< \alpha',\alpha' > < 0$ and $< \beta,\beta' > 1$, when $< \beta,\beta' > 0(< \beta,\beta' > 0)$, the ruled surface (15) is said to be type $M^1_1(M^2_1)$.

In the following, we give a simple example.

Example 1 Let $a$ be a nonzero constant, the ruled surface $M$ in $E^3_1$ can be expressed
$$P(s,t) = (as, t \cos s, t \sin s).$$
We choose $a = 2$, this parametrization defines a non-developable ruled surface of type $M^1_1$ in $E^3_1$, which is called a helicoid of the 3rd kind. See Fig.1.

3. Construction of spacelike developable surface with a non-null line of curvature

Firstly, we review a known theorem, which characterizes lines of curvature on a surface.

Theorem 1 A curve on a surface is a line of curvature if and only if the surface normals along the curve form a developable surface.
3.1. The given curve \( r(s) \) is spacelike curve

Let the normal surface of \( r(s) \) be

\[
Q(s, t) = r(s) + in_1(s),
\]

(16)

where \( n_1(s) = N \sinh \theta + B \cosh \theta \) is timelike. Let \( b_1(s) = N \cosh \theta + B \sinh \theta \).

According to the Theorem 1, \( r(s) \) is the line of curvature of the surface \( P(s, t) \) if and only if \( Q(s, t) \) is developable and \( n_1(s) \) is the normal vector of \( P(s, t) \).

By computing, we have

\[
\dot{n}_1(s) = \dot{\theta} \cosh \theta N + \sinh \theta N + \dot{\theta} \sinh \theta B + \cosh \theta B
\]

\[
= \dot{\theta} \cosh \theta N + \sinh \theta (\cosh \theta T + \dot{\theta} \sinh \theta B + \cosh \theta N)
\]

\[
= -k \sinh \theta T + (\dot{\theta} + \tau) b_1
\]

Then

\[
\dot{r}, n_1, \dot{n}_1 = 0 \iff (T, \sinh \theta N + \cosh \theta B, -k \sinh \theta T + (\dot{\theta} + \tau) b_1) = 0
\]

\[
\iff (T, \sinh \theta N, (\dot{\theta} + \tau) b_1) + (T, \cosh \theta B, (\dot{\theta} + \tau) b_1) = 0
\]

\[
\iff \dot{\theta} + \tau = 0
\]

\[
\iff \dot{\theta} = -\tau.
\]

That is

\[
\theta = -\int_{s_0}^s \tau ds + \theta_0,
\]

where \( s_0 \) is the starting value of the arc length. Generally, we choose \( s_0 = 0 \), and then \( \theta_0 = \theta(0) \).

Following, we give the corresponding theorem of the spacelike developable surface possessing the given spacelike curve as a line of curvature.

**Theorem 2** Given a spacial parametric spacelike curve \( r(s) \), there exists a spacelike developable surface \( P(s, t) \) possessing \( r(s) \) as a line of curvature.

**Proof** For the spacelike curve \( r(s) \), suppose the normal surface of it be

\[
P_1(s, t) = r(s) + in_1(s),
\]

(18)

where \( n_1(s) = N(s) \sin \theta + B(s) \cosh \theta \) is timelike. \( \theta(s) \) is defined by Eq. (17). Define a surface

\[
P(s, t) = r(s) - ib_1(s),
\]

(19)

obviously, \( P(s, 0) = r(s) \). Since

\[
P_1(s, t) \times P_1(s, t)|_{s=0} = (r(s) - ib_1(s)) \times (-b_1(s))|_{s=0}
\]

\[
= -T(s) \times (\cosh \theta N + \sinh \theta B)
\]

\[
= \cosh \theta B + \sinh \theta N
\]

\[
= n_1(s),
\]
then \( \mathbf{P}_1(s, t) \) is the normal surface of \( \mathbf{P}(s, t) \). Moreover, \( \theta(s) \) is defined as Eq.(17), then the surface \( \mathbf{P}_1(s, t) \) is developable. According to Theorem 1, \( r(s) \) is a line of curvature of \( \mathbf{P}(s, t) \).

Finally, since  
\[
(r, -\mathbf{b}_1, -\dot{\mathbf{b}}_1) = (T, \mathbf{b}_1, k \cosh \theta T) = 0,
\]
the spacelike surface \( \mathbf{P}(s, t) \) is developable. The conclusion holds.

In the following, we derive the conditions when the spacelike developable surface (19) is cylinder, cone or tangent surface respectively.

**Theorem 3** The spacelike developable surface Eq.(19) is a cylinder if and only if \( \theta = 0 \).

**Proof** The developable surface Eq.(19) is cylinder if and only if \( \mathbf{b}_1 \times \mathbf{b}_1 = 0 \). By computing,
\[
\begin{align*}
\mathbf{b}_1 \times \mathbf{b}_1 &= (\cosh \theta \mathbf{N} + \sinh \theta \mathbf{B}) \times (-k \sinh \theta T) \\
&= -k \sinh \theta \cosh (\mathbf{N} \times T) - k \sinh^2 \theta (\mathbf{B} \times T) \\
&= -k \sinh \theta \cosh \mathbf{B} - k \sinh^2 \theta \mathbf{N}.
\end{align*}
\]
That is
\[
\mathbf{b}_1 \times \mathbf{b}_1 = 0 \iff \begin{cases} 
 k \sinh \theta \cosh \theta = 0 \\
 k \sinh^2 \theta = 0 \\
 \sinh \theta = 0 \\
 \theta = 0.
\end{cases}
\]
This ends the proof.

**Theorem 4** The spacelike developable surface Eq.(19) is a cone if and only if \( k \cosh \theta = k_0 \cosh \theta_0 \), where \( \theta_0 = \theta(0), k_0 = k(0) \).

**Proof** Let \( \mathbf{w}(s) = \mathbf{r}(s) - \frac{r(\sigma) \mathbf{b}_1(\sigma)}{B(\sigma)} \mathbf{b}_1(\sigma) \) be the line of striction of the surface Eq.(19). Then \( \mathbf{P}(s, t) \) is a cone if and only if \( \dot{\mathbf{w}}(s) = 0 \). Firstly, let \( \lambda(s) = \frac{r(\sigma) \mathbf{b}_1(\sigma)}{B(\sigma)} \), then
\[
\dot{\mathbf{w}} = \dot{\lambda} \mathbf{b}_1 - \lambda \dot{\mathbf{b}}_1
\]
\[
= T - \dot{\lambda}(\cosh \theta \mathbf{N} + \sinh \theta \mathbf{B}) + k \lambda \cosh \theta T
\]
\[
= (1 + \lambda k \cosh \theta)T - \lambda k \cosh \theta \mathbf{N} - \lambda \sinh \theta \mathbf{B},
\]
this means \( \dot{\mathbf{w}} = 0 \) if and only if
\[
\left\{ \begin{array}{l}
 1 + \lambda k \cosh \theta = 0, \\
  \dot{\lambda} \cosh \theta = 0, \\
  \dot{\lambda} \sinh \theta = 0,
\end{array} \right.
\]
i.e.
\[
\lambda = \text{const.} = -\frac{1}{k \cosh \theta}.
\]
This equivalent to
\[
k \cosh \theta = k_0 \cosh \theta_0,
\]
which ends the proof.

**Theorem 5** The developable surface Eq.(19) is a tangent surface if and only if \( k \cosh \theta = k_0 \cosh \theta_0 \), where \( \theta_0 = \theta(0), k_0 = k(0) \).

**Proof** According to the proof of Theorem 4, if \( k \sin \theta \neq k_0 \sin \theta_0 \), then \( \dot{\mathbf{w}}(s) \neq 0 \). Since \( (\mathbf{w}, \mathbf{b}_1, \dot{\mathbf{b}}_1) = 0, \mathbf{w} \cdot \dot{\mathbf{b}}_1 = 0 \) and \( |\mathbf{b}_1| = 1, \mathbf{b}_1 \perp \dot{\mathbf{b}}_1 \), we can get \( \mathbf{w} \parallel \mathbf{b}_1 \). That is to say the surface Eq.(19) is a tangent surface. The conclusion holds.

(2) \( \mathbf{N}(s) \) is timelike, and \( \mathbf{B}(s) \) is spacelike

It is similar to the above case, we will not to analyze this situation in detail. In this case, the spacelike developable surface can be expressed as
\[
\mathbf{P}(s, t) = \mathbf{r}(s) + t \mathbf{b}_1(s),
\]
where \( \mathbf{b}_1(s) = \sinh \theta \mathbf{N}(s) + \cosh \theta \mathbf{B}(s) \) and its unit normal vector is \( \mathbf{n}_1(s) = \cosh \theta \mathbf{N}(s) + \sinh \theta \mathbf{B}(s) \).
The corresponding conditions when the spacelike developable surface is cylinder, cone and tangent surface respectively are as follows.

**Theorem 6** The spacelike developable surface Eq.(21) is a cylinder if and only if \( \theta = 0 \).

**Theorem 7** The spacelike developable surface Eq.(21) is a cone if and only if \( k \sinh \theta = k_0 \sinh \theta_0 \), where \( \theta_0 = \theta(0), k_0 = k(0) \).
Theorem 8: The developable surface Eq. (21) is a tangent surface if and only if \( k \sinh \theta \neq k_0 \sinh \theta_0 \), where \( \theta_0 = \theta(0), k_0 = k(0) \).

3.2. The given curve \( r(s) \) is timelike curve

If the given curve \( r(s) \) is timelike curve, in order to construct a spacelike developable surface, the normal vector of the surface must be timelike. Suppose the normal vector is

\[
\mathbf{n}_1(s) = A_1(s)\mathbf{N}(s) + A_2(s)\mathbf{B}(s)
\]

where \( \mathbf{N}(s), \mathbf{B}(s) \) are all spacelike. Then \( \mathbf{n}_1(s), \mathbf{n}_1(s) >= A_1(s)^2 + A_2(s)^2 > 0 \), which is impossible timelike. In a word, if we want to construct a spacelike surface, the curve \( r(s) \) can not be timelike.

In above theorems, we not only prove the existence of the spacelike developable surface, but also give the concrete expression of the surface. This is very meaningful in practical application.

4. Examples

In this section, some representative examples are given in order to verify the validity of this constructing method. In the first two examples, the curves possess spacelike normal vectors and timelike binormal vectors.

Example 2: In this example, we will construct a spacelike developable surface possessing the given parametric spacelike helix as a line of curvature. Given a parametric spacelike helix,

\[
r(s) = (a \cosh \left( \frac{s}{c} \right), \frac{bs}{c}, a \sinh \left( \frac{s}{c} \right)), \quad a > 0, b \neq 0, b^2 - a^2 = c^2, -1 \leq s \leq 1.
\]

By computing, we get

\[
\mathbf{T}(s) = \left( \frac{a}{c} \sinh \left( \frac{s}{c} \right), \frac{b}{c} - \frac{a}{c} \cosh \left( \frac{s}{c} \right) \right),
\]

\[
\mathbf{N}(s) = \left( \cosh \left( \frac{s}{c} \right), 0, \sinh \left( \frac{s}{c} \right) \right),
\]

\[
\mathbf{B}(s) = \left( -\frac{b}{c} \sinh \left( \frac{s}{c} \right), -\frac{a}{c}, -\frac{b}{c} \cosh \left( \frac{s}{c} \right) \right),
\]

\[
k(s) = \frac{a}{c^2}, \quad \tau(s) = -\frac{b}{c^2}.
\]

Then \( \theta(s) = \frac{b}{c}s + \theta_0 \). If we choose \( \theta_0 = 0 \), the corresponding spacelike developable surface is

\[
\mathbf{P}(s, t) = r(s) - t(c \sinh \theta N(s) + \sinh \theta \mathbf{B}(s))
\]

\[
= (a \cosh \left( \frac{s}{c} \right) - t \cosh \left( \frac{bs}{c^2} \right) \cosh \left( \frac{s}{c} \right), \frac{b}{c} \sinh \left( \frac{s}{c} \right) - t \sinh \left( \frac{bs}{c^2} \right) \sinh \left( \frac{s}{c} \right), \frac{a}{c} + t \sinh \left( \frac{bs}{c^2} \right) \cosh \left( \frac{s}{c} \right)).
\]

According to Theorem 5, it is a spacelike tangent developable surface. Choosing \( a = 1, b = 2 \), the surface is shown in Fig. 2(a). Figure 2(b) shows the surface with \( \theta_0 = \frac{\pi}{4} \).

Example 3: Given a parametric spacelike circle, whose normal vector and binormal vector are spacelike and timelike respectively.

\[
r(s) = (\cos s, \sin s, 0), \quad 0 \leq s \leq 2\pi.
\]

After simple computation, we have

\[
\mathbf{T}(s) = (-\sin s, \cos s, 0), \mathbf{N}(s) = (-\cos s, -\sin s, 0), \mathbf{B}(s) = (0, 0, -1),
\]

and \( k(s) = 1, \tau(s) = 0 \), then \( \theta(s) \) is a constant. Choosing \( \theta(s) = \frac{\pi}{3} \), obviously, according to Theorem 4, the spacelike developable surface

\[
\mathbf{P}(s, t) = (\cos s + t \cosh \theta \cos s, \sin s + t \cosh \theta \sin s, \sinh \theta),
\]

is a cone which possesses the given circle as line of curvature. (See Fig. 3).
In the following examples, the normal vectors and binormal vectors of the given curves are timelike and spacelike respectively.

**Example 4**
Given a parametric spacelike helix with timelike normal vector and spacelike binormal vector, the helix is

$$r(s) = (a \sinh \left( \frac{s}{c} \right), \frac{bs}{c}, a \cosh \left( \frac{s}{c} \right)), \quad -1 \leq s \leq 1,$$

where $a, b, c \in \mathbb{R}, a^2 + b^2 = c^2$. It is easy to get

$$T(s) = \left( \frac{a}{c} \cosh \left( \frac{s}{c} \right), \frac{b}{c}, \frac{a}{c} \sinh \left( \frac{s}{c} \right) \right)$$

$$N(s) = (\sinh \left( \frac{s}{c} \right), 0, \cosh \left( \frac{s}{c} \right)),$$

$$B(s) = \left( \frac{b}{c} \cosh \left( \frac{s}{c} \right), -\frac{a}{c}, -\frac{b}{c} \sinh \left( \frac{s}{c} \right) \right),$$

$$k(s) = \frac{a}{c^2}, \quad \tau(s) = \frac{b}{c^2}.$$

Then $\theta(s) = -\frac{b}{s} + \theta_0$. Let $\theta_0 = 0$, the corresponding spacelike developable surface can be expressed as

$$P(s, t) = r(s) + t(\sinh \theta N(s) + \cosh \theta B(s))$$

$$= (a \sinh \left( \frac{s}{c} \right) + t \sinh \left( -\frac{bs}{c^2} \right) \sinh \left( \frac{s}{c} \right) + \frac{bs}{c} t \cosh \left( \frac{bs}{c^2} \right) \cosh \left( \frac{s}{c} \right), \frac{bs}{c}, -a t \cosh \left( -\frac{bs}{c^2} \right)).$$
\[
a \cosh \left( \frac{s}{c} \right) + t \sinh \left( -\frac{bs}{c^2} \right) \cosh \left( \frac{s}{c} \right) + \frac{b}{c} t \cosh \left( \frac{bs}{c^2} \right) \sinh \left( \frac{s}{c} \right).
\]

It is a spacelike tangent developable surface. Choosing \( a = 2, b = 1 \), the surface is shown in Fig. 4(a). When \( \theta_0 = \frac{1}{2} \), see Fig. 4(b).

#### Example 5

Suppose we are given a parametric spacelike curve

\[ r(s) = (\sinh s, 0, \cosh s), \quad -1 \leq s \leq 1. \]

It is easy to get

\[ T(s) = (\cosh s, 0, \sinh s), \quad N(s) = (\sinh s, 0, \cosh s), \quad B(s) = (0, -1, 0), \]

and \( k(s) = 1, \tau(s) = 0, \) then \( \theta(s) \) is a constant. If \( \theta(s) = 0 \), the corresponding spacelike developable surface

\[ P(s, t) = r(s) + t(\sinh \theta N(s) + \cosh \theta B(s)) \]

\[ = (\sinh s, -t, \cosh s) \]

is a cylinder, which is shown in Fig. 5(a). Figure 5(b) shows the surface with \( \theta(s) = 1 \).

#### 5. Conclusions

In this paper, we extend our work in paper (Li 2013) to \( E^3_1 \) (Minkowski 3-space), and give an approach to construct a spacelike developable surface which possesses the given curve as a line of curvature. We not only prove the existence of the spacelike developable surface but also give the concrete expression of the resulting surface. At the same time, we derive the necessary and sufficient conditions when the developable surface is cylinder, cone or tangent surface respectively.
