We present the results of a search for relations between observables that are independent of the Chiral Perturbation Theory (ChPT) Next-to-Next-to-Leading Order (NNLO) Low-Energy Constants (LECs). We have found some relations between observables in $\pi\pi$, $\pi K$ scattering and $K_{l4}$ decay which have been evaluated numerically using fit 10 in [1] for the NLO LECs. We also show some preliminary results for a new global fit of the NLO LECs.
1. Introduction

Testing the validity of Chiral Perturbation Theory (ChPT) is a challenging task because of the many unknown parameters, called the Low Energy Constants (LECs), entering into the theory. In particular, at NNLO 90 unknown constants, the $C_i$, appear in the $p^6$ Lagrangian.

One way to overcome this problem is to study different combinations of observables that depend on the $C_i$ in the same way. These lead to $C_i$-independent relations which can be used to perform the test. Furthermore those combinations might be useful to gain information on the LECs too, since they let us isolate the same combinations of $C_i$ using different observables.

In [2] we study 76 observables at NNLO and find 36 such relations. We compare ChPT NNLO predictions with data/dispersive results for 13 of these. The observables involved are the ones in $\pi\pi$ and $\pi K$-scattering and in $K_{l4}$ decay. Here we first discuss how we perform the numerical analysis, the results of which appear in Tab.1, 2, 3 and 4, then we present for each process the relations studied. Finally we show some preliminary results for a new global fit of the $L_i$ at NNLO.

2. Numerical Analysis

The numerical analysis of the $C_i$-independent relations has been done in the following way. First we evaluate the combinations of observables appearing in each side of the relations using experiment/dispersive (exp) results of [3] for $\pi\pi$ scattering, [4] for $\pi K$ scattering and [5, 6] for $K_{l4}$ decay. Then we use ChPT results up to order $p^6$ [7, 8, 9] setting the $L_i$ to the values of fit 10 in [1]. Finally we subtract from the first (exp) evaluation the ChPT one. These differences will contain the $C_i$ part and higher order corrections. They have been quoted in Tab.1, 2, 3 and 4 in the columns labeled remainder. This has been done for each side of the relations under study. To check whether a relation is well satisfied we compare the remainders of its left-hand-side (LHS) and right-hand-side (RHS). Since they contain the same $C_i$ combinations, they should be equal within the uncertainties.

The errors quoted in the second columns of Tab.1, 2, 3 and 4 are obtained adding in quadrature the uncertainties in [3, 4, 5, 6]. This might result in an underestimate of the total error because of correlations. The theoretical errors due to the NLO LECs are shown in brackets in the columns of Tab.1, 2, 3 and 4 labeled NNLO 1-loop. They are obtained by varying all the $L_i$ around the central values of fit 10 according to the full covariance matrix as obtained by the authors of [1] and exploring the region with $\chi^2$/dof $\approx$ 1. The error is then estimated as the maximum deviation observed. The error for the $L_i$ contribution at NLO is never shown since it drops out of all the relations. No uncertainties due to higher order contributions have been added. The uncertainties due to theoretical errors are mostly on the last quoted digit.

3. $\pi\pi$ scattering

The $\pi\pi$ scattering amplitude can be written as a function $A(s,t,u)$ which is symmetric in $t$, $u$:

$$A(\pi^a\pi^b \rightarrow \pi^c\pi^d) = \delta^{a,b}\delta^{c,d}A(s,t,u) + \delta^{a,c}\delta^{b,d}A(t,u,s) + \delta^{a,d}\delta^{b,c}A(u,t,s),$$  (3.1)
where \( s, t, u \) are the usual Mandelstam variables. The isospin amplitudes \( T_I(s, t) \) \((I = 0, 1, 2)\) are
\[
T^I(s, t) = 3A(s, t, u) + A(t, u, s) = A(u, s, t),
\]
and are expanded in partial waves
\[
T^I(s, t) = 32\pi \sum_{\ell=0}^{+\infty} (2\ell + 1) P_\ell(\cos \theta)t'_\ell(s),
\]
where \( t \) and \( u \) have been written as \( t = -\frac{1}{2}(s - 4m^2_\pi)(1 - \cos \theta), u = -\frac{1}{2}(s - 4m^2_\pi)(1 + \cos \theta) \). Near threshold the \( t'_\ell \) are further expanded in terms of the threshold parameters
\[
t'_\ell(s) = q^{2\ell}(a'_\ell + b'_\ell q^2 + O(q^4)), \quad q^2 = \frac{1}{4}(s - 4m^2_\pi),
\]
where \( a'_\ell, b'_\ell, \ldots \) are the scattering lengths, slopes, \ldots. We studied the 11 parameters where a dependence on the \( C_i \) shows up. Using \( s + t + u = 4m^2_\pi \) we can write the amplitude to order \( p^6 \) as
\[
A(s, t, u) = b_1 + b_2 s + b_3 s^2 + b_4 (t - u)^2 + b_5 s^3 + b_6 (t - u)^2 + \text{non polynomial part}
\]
The tree level Feynman diagrams give polynomial contributions to \( A(s, t, u) \) which must be expressible in terms of \( b_1, \ldots, b_6 \). Therefore we expect and find 5 relations:
\[
\begin{align*}
[5b_0^2 - 2b_0 - 27a_1] - 15a_0^2 + 6a_0^0 & = -18 [b_1]_{C_i}, \\
[3a_1 + b_0^0]_{C_i} & = 20 [b_0^0 - b_0^0 - a_2^2 + a_2^0]_{C_i}, \\
[b_0^0 + 5b_0^0 + 9a_1] & = 90 [a_0^0 - b_0^0]_{C_i}, \\
[3b_1^0 + 25a_2^3]_{C_i} & = 10 [a_2^0]_{C_i}, \\
-5b_2^0 + 2b_0^0 & = 21 [a_1^0]_{C_i},
\end{align*}
\]
where \([A]_{C_i} \equiv C_i\)-dependent part of \( A \). All quantities are expressed in units of \( m^2_\pi \). In fact, since these relations hold for every contribution to the polynomial part, they are valid for the NLO tree level contribution as well and for two- and three-flavour ChPT. Thus they get \( L_i \)-contributions only at NNLO via the non polynomial part of Eq. (3.4).

In Tab. [1] we show our numerical results. We quote the left-hand-side (LHS) and right-hand-side (RHS) of each of the relations. In the second column we use the values of the threshold parameters of [3]. The next columns use the ChPT results of [7] and give the contributions from pure one-loop at NLO, the tree level NLO contribution, the pure two-loop contribution, and the \( L_i \) dependent part at NNLO (called NNLO 1-loop).

Comparing the remainders of the LHS with the RHS ones, we see that the first three relations are very well satisfied, while the last two work at a level around two sigma.

We can also check how the two-flavour predictions hold up. Since here the corrections are in powers of \( m^2_\pi \) rather than in powers of \( m^2_K \), the expansion should converge better. For the ChPT evaluation we use the threshold parameters as quoted in [3] for their best fit of the NLO LECs. The result is shown in Tab. [2]. We see the same pattern as for the three-flavour case: the first three relations are very well satisfied while the last two are somewhat worse but below two sigma.
4. $\pi K$ scattering

The $\pi K$ scattering has amplitudes $T^I(s,t,u)$ in the isospin channels $I = 1/2, 3/2$. As for $\pi \pi$ scattering we introduce the partial wave expansion of the isospin amplitudes

$$T^I(s,t,u) = 16\pi \sum_{\ell=0}^{\infty} (2\ell + 1)P_\ell(\cos \theta)t^I_\ell(s), \quad \text{(4.1)}$$

and we define scattering lengths $a^I_\ell, b^I_\ell$ by expanding the $t^I_\ell(s)$ near threshold:

$$t^I_\ell(s) = \frac{1}{2} \sqrt{s} q^{2I}_{\pi K} (a^I_\ell + i b^I_\ell q^{2I}_{\pi K} + \mathcal{O}(q^4_{\pi K})), \quad \quad q^{2I}_{\pi K} = \frac{s}{4} \left(1 - \frac{(m_K + m_\pi)^2}{s}\right) \left(1 - \frac{(m_K - m_\pi)^2}{s}\right).$$

---

Table 1: The relations found in the $\pi\pi$-scattering. The lowest order contribution is always zero by construction. The NLO LEC part satisfies the relation, as it should. Notice the extra factors of ten for some of them. All quantities are in the units of powers of $m_\pi$.  

| $s_{\pi \pi}$ | NLO 1-loop | NLO LECs 2-loop | NLO 1-loop | NNLO 1-loop | remainder |

| $10^2$ LHS (3.9) | 0.92 ± 0.07 | 1.00     | −0.08 ± 0.07  |
| $10^3$ RHS (3.9) | 1.18 ± 0.04 | 1.15     | 0.04 ± 0.04   |
and $t = -2q^2_{\pi K}(1 - \cos \theta)$, $u = -s - t + 2m_K^2 + 2m_\pi^2$. Again we studied only those observables where a dependence on the $C_i$ shows up.

It is also customary to introduce the crossing symmetric and antisymmetric amplitudes $T^\pm(s,t,u)$

$$3T^+(s,t,u) = T^{1/2}(s,t,u) + T^{3/2}(s,t,u), \quad T^-(s,t,u) = T^{1/2}(s,t,u) - T^{3/2}(s,t,u), \quad (4.2)$$

which can be expanded around $t = 0, s = u$ using $v = (s-u)/(4m_K)$ (subthreshold expansion):

$$T^+(s,t,u) = \sum_{i,j=0}^\infty c_{ij}^t v^{2j}, \quad T^-(s,t,u) = \sum_{i,j=0}^\infty c_{ij}^- v^{2j+1}. \quad (4.3)$$

There are 10 subthreshold parameters that have tree level contributions from the NNLO LECs, in $c_{01}^-$ and $c_{20}^-$ the same combination $-C_1 + 2C_3 + 2C_4$ appears \[8\]:

$$16\rho^2 [c_{20}^-]_{C_i} = 3 [c_{01}^-]_{C_i}. \quad (4.4)$$

Therefore in the isospin odd channel only three subthreshold parameters get independent contributions from the $C_i$. So for the 7 differences $a_-^\ell = a_\ell^{1/2} - a_\ell^{3/2}$ and $b_-^\ell = b_\ell^{1/2} - b_\ell^{3/2}$ getting contributions at NNLO and three subthreshold parameters we expect four relations:

$$(\rho^4 + 3\rho^3 + 3\rho + 1) [a_1^-]_{C_i} = 2\rho^2 (\rho + 1)^2 [b_1^-]_{C_i} - \frac{2}{3} \rho (\rho^2 + 1) [b_0^-]_{C_i} + \frac{1}{2\rho} (\rho^2 + \frac{4}{3} \rho + 1) (\rho^2 + 1) [a_0^-]_{C_i}, \quad (4.5)$$

$$5(\rho + 1)^2 [b_2^-]_{C_i} = \frac{(\rho - 1)^2}{\rho^2} [a_1^-]_{C_i} - \frac{\rho^4 + \frac{2}{3} \rho^2 + 1}{4\rho^2} [a_0^-]_{C_i} + \frac{\rho^2 - \frac{2}{3} \rho + 1}{2\rho^2} [b_0^-]_{C_i}, \quad (4.6)$$

$$5(\rho^2 + 1) [a_2^-]_{C_i} = [a_1^-]_{C_i} + 2\rho [b_1^-]_{C_i}, \quad (4.7)$$

$$7(\rho^2 + 1) [a_3^-]_{C_i} = [a_2^-]_{C_i} + 2\rho [b_2^-]_{C_i}. \quad (4.8)$$

the threshold parameters are expressed in units of $m_\pi$, and we use the symbol $\rho = m_K/m_\pi$.

$T^+$ brings in 7 more combinations of threshold parameters, $a_+^\ell = a_\ell^{1/2} + 2a_\ell^{3/2}$ and $b_+^\ell = b_\ell^{1/2} + 2b_\ell^{3/2}$, but there are 6 independent subthreshold parameters so we find only one more relation:

$$7 [a_3^+]_{C_i} = \frac{1}{2\rho} [a_2^+]_{C_i} - [b_2^+]_{C_i} + \frac{1}{5\rho} [b_1^+]_{C_i} - \frac{1}{60\rho^3} [a_0^+]_{C_i} - \frac{1}{30\rho^2} [b_0^+]_{C_i}. \quad (4.9)$$

Again these relations hold for all tree-level contributions up to NNLO. The numerical check is shown in Tab. \[\text{III}\]. The columns in Tab. \[\text{III}\] have the same meaning as in Tab. \[\text{II}\].

The first relation is reasonably satisfied, somewhat below two sigma. The second relation has a large discrepancy but if we assume a theory error of about half the NNLO contribution it seems reasonable. The third relation is well satisfied but the RHS has a rather large experimental error. The fourth relation does not work well, mainly due to the fact that we seem to underestimate the value for $a_2^-$. The last relation works well.
The numerical results are quoted in Tab. 4. The first relation does not work but the second is well satisfied. If we look in the numerical results we see that the relation 1 is 3.01 and vanishes for the others. The NLO LECs part satisfies the relation. Notice the extra factors of ten for some of them. All quantities are in the units of powers of $m_{\pi^+}$.

Table 3: The relations found in the $\pi K$-scattering. The tree level contribution to the LHS and RHS of relation 1 is 3.01 and vanishes for the others. The NLO LECs part satisfies the relation. Notice the extra factors of ten for some of them. All quantities are in the units of powers of $m_{\pi^+}$.

5. $\pi\pi$ and $\pi K$ scattering

If we consider the $\pi\pi$ and $\pi K$ system together we get two more relations due to the identities

$$[b_5]_{C_i} = \left[ c_{30}^+ \right]_{C_i} + \frac{3}{p} \left[ c_{20}^- \right]_{C_i}, \quad [b_6]_{C_i} = \frac{1}{4p} \left[ c_{20}^- \right]_{C_i} + \frac{1}{16p^2} \left[ c_{11}^+ \right]_{C_i},$$

where $c_{ij}^+ (c_{ij}^-)$ are expressed in units of $m_{\pi}^{2j_2+j_1} (m_{\pi}^{2j_2+j_1})$. We can express these relations in terms of the threshold parameters (all quantities expressed in powers of $m_{\pi^+}$):

$$6 \left[ a_1^+ \right]_{C_i} = (1 + \rho) \left[ a_3^+ + 3a_3^- \right]_{C_i},$$

$$3 \left[ (1 + \rho)^2 \left[ b_5^+ \right]_{C_i} + 7 (1 - \rho)^2 \left[ a_1^+ \right]_{C_i} \right] = (1 + \rho) \left[ 7 (1 - 4\rho + \rho^2) \left[ a_3^- \right]_{C_i} + \left[ a_3^+ + 2pb_2^+ \right] \right].$$

The numerical results are quoted in Tab. 4. The first relation does not work but the second is well satisfied. If we look in the numerical results we see that $a_3^-$ plays a minor role in the RHS of the second relation but is important in the first, so this could be the same problem of relation (4.8). A related analysis can be found in [13].

6. $K_{\ell 4}$

The decay $K^+(p) \rightarrow \pi^+(p_1)\pi^-(-p_2)e^+(p_3)e^-(p_4)v(p_{\nu})$ is given by the amplitude [11]

$$T = \frac{G_F}{\sqrt{2}} V_{us}^* \bar{u}(p_{\nu})(1 - \gamma_5)\gamma_\mu(p_3)\gamma_{\nu}(p_4)(V^\mu - A^\mu)$$

where $V^\mu$ and $A^\mu$ are parametrized in terms of four formfactors: $F, G, H$ and $R$ (but the $R$-formfactor is negligible in decays with an electron in the final state). Using partial wave expansion and neglecting $d$ wave terms one obtains [12]:

$$F = f_x + f' x q^2 + f'' x q^4 + f'' e q^6/4m_{\pi}^2 + f_{\ell} \sigma_{\pi} X \cos \theta + \ldots,$$

$$G_{\rho} = g_{\rho} + g'_{\rho} q^2 + g''_{\rho} q^4 + g'' e q^6/4m_{\pi}^2 + g_{\ell} \sigma_{\pi} X \cos \theta + \ldots$$

(6.2)
Here $s_\pi(x)$ is the invariant mass of dipion (dilepton) system, and $q^2 = s_\pi/(4m_\pi^2) - 1$. $\theta$ is the angle of the pion in their rest frame w.r.t. the kaon momentum and $t - u = -2\sigma_\pi \lambda \cos \theta$. Using NNLO ChPT results $[8,9]$ we find one relation between the quantities defined in $(6.2)$ and $\pi K$ scattering:

$$\sqrt{2} \left[ f''_s \right]_{CI} = 64 \rho F_\pi \left[ c_{50}^+ \right]_{CI}.$$  \hfill (6.3)

This leads to a relation between $\pi K$ threshold parameters and $f''_s$ which, with all quantities expressed in units of $m_{\pi^+}$, reads:

$$\sqrt{2} \left[ f''_s \right]_{CI} = \frac{32\pi}{1 + \rho} F_\pi \left[ 35 \frac{2 + \rho + 2\rho^2}{6} \left[ a^+_3 \right]_{CI} - \frac{5}{4} \left[ a^+_2 + 2\rho b^+_2 \right]_{CI} \right].$$  \hfill (6.4)

Numerical results for $(6.4)$ are shown in Tab. 4. The experimental results is taken from $[5]$ for $f''_s/f_s$ and from $[6]$ for $f_s$. This should be an acceptable combination since the central value for $f''_s/f_s$ and $f''_s/f_s$ from $[6]$ are in good agreement with those of $[5]$. This relation is not satisfied: the sign is even different on the two sides. Notice that, in both cases, we also see that the ChPT series has a large NNLO contribution.

It has been already noticed, see $[1]$ and Fig. 1, that ChPT, at present, underestimates the curvature $f''_s$. On the other hand there are indications that dispersive analysis techniques might help solving this problem: Fig. 7 in $[1]$ shows that the dispersive result of $[13]$ has a larger curvature then the two-loop result. Therefore, we do not consider this discrepancy a major problem for ChPT.

### 7. New fits of the NLO constants (preliminary results)

As remarked in $[14]$, many NNLO calculations are now available in three-flavour ChPT. Besides, new lattice and dispersive results and further experimental data are at our disposal too. A study of the predictive power of NNLO ChPT is needed, and therefore also an update of the $L_i$ fit. For this reason we are working on a new program to perform this fit with many more observables implemented. So far we have included masses and decay constants, $K_{\ell4}$ formfactors, $\pi\pi$ and $\pi K$ scattering lengths and the scalar pion radius. For now we rely on the resonance estimates of the $C_i$ used in $[1]$, although our plan is to achieve more information on them.

Our first preliminary results are summarized in Tab. 3. In the second column we quote fit 10 of $[1]$. This was found using the available linear fit for $K_{\ell4}$ of $[8]$, $F_K/F_\pi = 1.22$, the kaon and

|            | LHS $(5.2)$ | RHS $(5.2)$ | LHS $(5.3)$ | RHS $(5.3)$ | LHS $(6.4)$ | RHS $(6.4)$ |

Some more comment can be found in [16].
8. Conclusions

We have performed a systematic search for relations between observables that allow a test of ChPT at NNLO order in a $C_i$-independent way. We studied in detail the relations for the $\pi\pi$, $\pi K$ scattering and $K_{\ell 4}$ since for these cases enough experimental and/or dispersion theory results exist.

The resulting picture is that ChPT at NNLO mostly works but there are troublesome cases. The $\pi\pi$ system alone works well. The $\pi K$ system alone works satisfactorily but with some discrepancies. The same can be said for the combinations of both systems. A common part in these two cases is the presence of $a_3^-$. Comparing $\pi K$ scattering and $K_{\ell 4}$ leads to a clear contradiction which needs further investigation.

Acknowledgments

IJ gratefully acknowledges an Early Stage Researcher position supported by the EU-RTN Programme, Contract No. MRTN–CT-2006-035482, (FLAVIAnet). This work is supported in part by the European Commission RTN network, Contract MRTN-CT-2006-035482 (FLAVIAnet), European Community-Research Infrastructure Integrating Activity “Study of Strongly Interacting Matter” (HadronPhysics2, Grant Agreement n. 227431) and the Swedish Research Council. We thank the organizers for a very pleasant meeting.
