Abstract

Introduction/Aim: The incidences of medicinal plant toxicity in the society are becoming serious in the society. There is the need for scientist to determine the toxicity profile of most is therefore very important. Terminalia Chebula is traditionally found in natural colon cleansers and used in treatment of constipation, digestive disorders, irregular fevers, flatulence, ulcers, vomiting, colic, and hemorrhoids. In this study the effect of sub-acute administration of Terminalia Chebula on the brain, spleen, and stomach were evaluated.

Method: Rats of either sex were selected. Group 1 received distilled water (10 ml/kg), while group 2, 3 and 4 received Terminalia Chebula 200, 400 and 800 mg/kg respectively. Animals were kept in standard cages and given access to the extract, water and food orally for 28 days, after which they were weighed and sacrificed. Blood was collected by cardiac puncture and taken immediately for hematological and chemopathological analysis. The brain, spleen, and stomach were also harvested for histological study of the effect of the plant using Haematotoxylin and Eosin (H&E) staining technique.

Result: There was significant (P<0.05) decrease in RBC, HGB, MCV, while there was no change in the level of neutrophiles, basophiles, eosinophiles and platelets. The size of the brain, spleen and stomach were observed to be slightly significantly (p<0.05) increased in rats with dose level of 400 mg/kg, while there was no significant (p<0.05) change observed at the 200 and 800 mg/kg dose. Histopathological examination of the brain and stomach showed normal features at all doses. The spleen showed slight lymphocyte hyperplasia at all doses and normal features at the control (10 ml/kg).

Conclusion: result of the study suggests that care should be observed when taken this herb.
is dark brown with some longitudinal cracks. Leaves are ovate and elliptical, with two large glands at the top of the petiole. The flowers are monoeocious, dull white to yellow, with a strong unpleasant odour, borne in terminal spikes or short panicles. The fruit is mild laxative, stomachic, tonic, alterative, antispasmodic [7,8].

It is useful in ophthalmia, hemorrhoids, dental caries, bleeding gums, ulcerated oral cavity. Its paste with water is found to be anti-inflammaratory, analgesic and having purifying and healing capacity for wounds. Its decoction is used as gargle in oral ulcers, sore throat. Its powder is a good astringent dentifrice in loose gums, bleeding and ulceration in gums [9]. It is good to increase appetite, digestive aid, liver stimulant, stomachic, gastrointestinal prokinetic agent, and mild laxative. The powder of *T. chebula* fruits has been used in chronic diarrhea. It is used in nervous weakness, nervous irritability. It promotes the receiving power of five senses. It is adjuvant in hemorrhages due to its astringent nature and good for chronic cough, chorizo, sore throat as well as asthma. Also it is useful in renal calculi, dysuria, retention of urine and skin disorders with discharges like allergies, urticaria and other erythematous disorders. Because of the wide use of this plant, this study is aim at evaluating the sub-acute toxic effect of the ethanol leaf extract of *Terminalia chebula* in Wister rats [7-9].

**Materials and Method**

**Animals**

Male and female Wister rats were obtained from College of Veterinary Medicine, Northwest A&F University, Yangling, Shaanxi, China. They were maintained on standard animal pellets and given water ad libitum. Permission and approval for animal studies were obtained from the College of Veterinary Medicine, Northwest A&F University.

**Plant Collection**

Fresh leaves of *Terminalia chebula* were collected from its natural habitat from nearby Yunnan province, China. The plant was authenticated from College of Veterinary Medicine, Northwest A&F University.

**Plant Extraction**

The leaves were shadow dried for two weeks. The dried plant material was further reduced into small pieces and pulverized. The powdered material was macerated in 70% ethanol. The liquid filtrates were concentrated and evaporated to dryness at 40°C in vacuum using rotary evaporator. The ethanol extract was stored at -4°C until used.

**Animal Study**

Twenty-four (24) rats of either sex (125-300g) were selected and randomized into four groups of six rats per group. Group 1 served as the control and received normal saline (10ml/kg) while the rats in groups 2, 3 and 4 were giving 200, 400, and 800 mg/kg of extract respectively. The weights of the rats were recorded at the beginning of the experiment and at weekly intervals. The first day of dosing was taken as D0 while the day of sacrifice was designated as D29.

**Haematological Analysis**

The rats were sacrificed on the 29th day of experiment. Blood samples were collected via cardiac puncture. The blood was collected into sample bottles containing EDTA for hematological analysis such as Hemoglobin concentration, White Blood Cell counts (WBC), differentials (neutrophils, eosinophils, basophils, lymphocyte and monocyte), Red Blood Cell count (RBC), platelets and Hemoglobin (Hb) concentration using automated Haematology machine (Cell-Dyn, Abbott, USA).

**Food and Water Consumption**

The amounts of feed and water consumed were measured daily as the difference between the quantity of feed and water supplied each day and the amount remaining after 24hours. The rats were sacrificed on the 29th day of experiment and organs were harvested for further gross histo-pathological analysis.

**Statistical Analysis**

Data were expressed as the Mean ± Standard Error of the Mean (SEM). Data were analyzed statistically using one-way Analysis of Variance (ANOVA) followed by Dunnett’s post hoc test for multiple comparisons between the control and treated groups. Values of *P* ≤ 0.05 were considered significant.

**Result**

**Effect of 28 days Oral Administration of Terminalia chebula on Hematological Parameters in Rats**

*Terminalia chebula* caused significant (*p*<0.05) decrease in the level of red blood cell, hemoglobin, platelet etc. and significantly (*p*<0.05) caused an increase in mean corpuscular hemoglobin concentration in the rats at the dose level of 400 mg/kg compared to the control. The level of basophiles, neutrophiles, eosinophils and lymphocytes were however not significantly (*p*<0.05) affected by mean corpuscular hemoglobin concentration (Table 1) (Figures 1-6).
Table 1: Effect of 28 days oral administration of ethanol leaf extract of Ocimum canum on hematological parameters in wistar rats.

| Treatment (mg/kg) | Hematological parameters | DW(10ml/kg) | 200 mg/kg | 400 mg/kg | 800 mg/kg |
|------------------|--------------------------|-------------|-----------|-----------|-----------|

**Table 3**: Effect of 28 days oral administration of *Ocimum canum* on relative organ to body weight ratio in rats.

| Relative Treatment (mg/kg) | Organ to Brain | Body Weight Stomach | Ratio % Spleen |
|----------------------------|----------------|---------------------|----------------|
| DW (10 ml/kg)              | 0.818±0.02     | 0.905±0.063         | 0.420±0.017    |
| 200 mg/kg                  | 0.843±0.098    | 0.833±0.027         | 0.429±0.061    |
| 400 mg/kg                  | 1.43±0.161*    | 1.328±0.121*        | 0.935±0.089*   |
| 800 mg/kg                  | 0.952±0.068    | 0.974±0.041         | 0.401±0.029    |

Note: *Significantly different from the Distilled Water (DW) control at p<0.05. DW = distilled water.

**Effect of Oral Administration of Ethanol Leaf Extract of *Terminalia chebula* on Histology of Brain, Lungs, Spleen and Stomach of Rats**

Histopathological examination of the brain showed normal features at all doses and slight vacuolation at 400 mg/kg dose of the extract. The lungs showed normal features at all doses respectively. The spleen showed slight lymphocyte hyperplasia at all doses and normal features at the control (10 ml/kg). The stomach showed normal features at all doses of the extract administered.

**Discussion**

Herbal medicine is becoming popular particularly in developing counties and there is an increased interest in green medicine simply because it is considered safe relative to conventional medicines [10-12]. Traditionally, plants and plant extracts were used to cure many diseases and disorders. However, before usage it is of utmost important to ensure its safety [13,14]. The extract may be therapeutically very efficient but if its toxicity assessment is not worked out, it will not be accepted. Hence, toxicity assessment...
Hematological parameters are useful indices that can be employed to assess the toxic potentials of plant extracts in living systems [16,17]. They can also be used to explain blood relating functions of chemical compound/plant extract. Present result showed that ethanol leaf extract of *Terminalia chebula* caused a reduction in the level of red blood cells, hemoglobin, hematocrit, mean corpuscular volume, mean corpuscular hemoglobin and mean corpuscular hemoglobin concentration which means that it can significantly reduce oxygen carrying capacity of the blood and thus cause anemia. Anemia is a condition where the blood has insufficient red blood cells to carry oxygen from the lungs to the rest of the body or not enough hemoglobin [18-20], the iron-rich protein that carries oxygen inside the red blood cells and gives blood its red color [21-24]. Anemia takes several forms and may vary in severity and duration [22,24]. Also reductions in Packed Cell Volume (PCV) and Red Blood Cell (RBC) were also observed in rats administered with the extract. This implies that *Terminalia chebula* could cause disturbances in omsoregulatory system of the blood cells and/or oxidative injury to the cell membrane. The extract could suppress the haemopoietic system. The reduction may have also occurred due to lysis of blood cells. Sule et al, 201225 also observed decrease in RBC, PCV, hemoglobin and lymphocytes in rats fed with extracts of *Acalypha wilkesiana*.

The major functions of the white blood cell and its differentials are to fight infections, defend the body by phagocytosis against invasion by foreign organisms and to produce or at least transport and distribute antibodies in immune response [26]. The extract had no effect on white blood cell parameters, suggesting that it does not disturb or improve immune system. In this study, there was significant increase in the mean body weight ratio of brain, stomach and spleen of Wister rats administered with ethanol leaf extract of *Terminalia chebula* at 400 mg/kg dose below and beyond which there was no effect. The probable reason could be that the plant extract has some toxicity effects on these organs which tend to increase their sizes. This may also suggest that the plant may have a biphasic tendency. That is, at a particular dose it has an oxidant effect, while at higher dose it may be reversed or act as an antioxidant. In addition, reports indicated that tannins, saponins, volatile oils, saponin glycosides and alkaloids were detected in fresh and dried samples of *Terminalia chebula* [19,26-28]. Histology observation also agrees with other parameters that the plant extract may be deleterious at some doses while at other doses, the plant may be safe.

**Conclusion**

Though, biochemical analysis was not carried out in this work, result suggests the need for caution while consuming the plant. It is also important to establish the right dose that will be beneficial for the purpose intended. Further work that will include biochemical study may be done to give a better and broader insight on the possible activity of *Terminalia chebula* in the body.
