Abstract

The Chinese species of *Metriocnemus* van der Wulp *s. str.*, 1874 is reviewed. *M. (M.) calcaneum* sp. n. is described and illustrated as adult male. *M. (M.) albolineatus* (Meigen) is recorded from China for the first time. *M. (M.) beringensis* Cranston & Oliver, *M. (M.) bilobatus* Makarchenko & Makarchenko, *M. (M.) caudigus* Sæther, *M. (M.) intergerivus* Sæther, *M. (M.) tamaokui* Sasa and *M. (M.) tristellus* Edwards are recorded from the Oriental Region for the first time. A key to the males of 17 Chinese *Metriocnemus* (*Metriocnemus*) species is given.

Keywords

Chironomidae, *Metriocnemus*, new species, new records, China

Introduction

The genus *Metriocnemus* van der Wulp was erected in 1874; Coquillett (1910) subsequently designated *Chironomus albolineatus* Meigen, 1818 as the type species. Langton and Cobo (1997) described subgenera *Inermipupa* based on a species with a highly aberrant pupa (*Metriocnemus* (*Inermipupa*) *calencitaratum*). Subsequently Ashe and
O’Connor (2000) erected the subgenus Crymaleomiva for a species which not fully fits the larva, pupa or adult diagnosis of the genus (Metriocnemus (Crymaleomvia) brunneri).

The genus is found in mosses, phytotelmata, springs, ditches, streams and occasionally in the middle of lakes and rock pools (Cranston, Oliver and Sæther 1989, Sæther 1989). The genus presently includes 67 recorded species and had a worldwide distribution. Twelve species occur in the Oriental Region, 38 in the Palearctic Region, 15 in the Nearctic Region, 7 in the Neotropical Region, 6 in the Afrotropical Region and one in the Australasian Region (Ashe and O’Connor 2012). Grounded on virga present or absent, Sæther (1995) divided the genus into two main groups, the eurynotus group (with well developed virga) and the fuscipes group (without virga).

Regarding taxonomic study on the genus Metriocnemus in China, Sæther (1995) recorded 7 species including 3 species originally described from China. Wang (2000) listed ten species of Metriocnemus from China, among which the species of M. gracei Edwards, 1929 should be M. tristellus Edwards after we re-examined the specimen. Based on new material from China, one new species is described below and seven additional species are newly recorded. A key to the males of the Metriocnemus s.str. species occurring in China is presented.

Material and methods

The material examined was mounted on slides in Canada balsam, following the procedure outlined by Sæther (1969). The morphological nomenclature follows Sæther (1980). Measurements are given as ranges.

The types and other examined material in this study are housed in the College of Life Sciences, Nankai University, China (BDN).

The species

Metriocnemus (Metriocnemus) aculeatus Chaudhuri & Bhattacharyay
http://species-id.net/wiki/Metriocnemus_aculeatus

Metriocnemus aculeatus Chaudhuri & Bhattacharyay in Chaudhuri et al. (1989:309), Sæther (1995:55), Wang (2000:637).

Material examined. CHINA: Sichuan Province, Jinfo Mountain, 30°3’30”N, 103°53’15”E, 1 male, 9.v.1986, light trap, X. Wang. Fujian Province, Wuyi Mountain, 27°43’46”N, 118°1’52”E, 4 males, 28–30.iv.1993, light trap, X. Wang. Guizhou Province, Fanjing Mountain, Huguo Temple, 27°54’43”N, 108°38’35”E, 4 males, 2–4. vii.2001, light trap, R. Zhang.
New species and records of *Metriocnemus van der Wulp s. str.* from China...

**Remarks.** The species differs from all other *Metriocnemus* species by the wing chaetotaxy, the characteristic hypopygium with very long, sharply pointed anal point and a gonostylus lacking crista dorsalis. The Chinese specimens has higher antennal ratio (AR = 1.00–1.73) than the Indian specimens (AR = 1.09). Among the specimens of China, one was identified as *M. hirticollis* (Staeger, 1839), which should be *M. (M.) albolineatus* (Meigen, 1818) after we re-examined the specimen.

**Distribution.** *Metriocnemus (M.) aculeatus* has been recorded from India (Chaudhuri et al. 1989) and the Oriental China.

*Metriocnemus (Metriocnemus) albolineatus* (Meigen)
http://species-id.net/wiki/Metriocnemus_albilineatus

*Chironomus albilineatus* Meigen, 1818:39
*Chironomus atratulus* Zetterstedt, 1850:3590
*Metriocnemus albolineatus* (Meigen); Sæther (1989:399)

**Material examined.** CHINA: Sichuan Province, Ganzi City, Yajiang County, 29°53′48″N, 103°10′19″E, 1 male, 14.vi.1986, light trap, X. Wang.

**Remarks.** The male can be separated from other species of *Metriocnemus* by having a short virga (23–26 µm long), very weak inferior volsella, rounded to bluntly triangular crista dorsalis, tapering anal point with blunt apex, Sc with 10–31 setae, M with 15–32 setae, and cell m with 35–73 setae. This species is a member of the *eurynotus* group, but the male can be separated from other species of the group by having a shorter virga and a weaker inferior volsella. It has more setae on the wings than *M. (M.) brusti* and *M. (M.) corticalis*, but fewer than *M. (M.) eurynotus*.

**Distribution.** The species is recorded from the Nearctic, Palaearctic and Oriental regions (Ashe and O’Connor 2012). In China it was collected from Sichuan Province in Oriental China for first time.

*Metriocnemus (Metriocnemus) beringensis* (Cranston & Oliver)
http://species-id.net/wiki/Metriocnemus_beringensis

*Apometriocnemus beringensis* Cranston & Oliver, 1988:428
*Metriocnemus beringensis* (Cranston & Oliver); Sæther (1995:59)

**Material examined.** CHINA: Tibet, Zhangmu, 28°46′26″N, 87°30′22″E, 1 male, 15.viii.1987, light trap, C. Deng. Tibet, Zhangmu, 28°46′26″N, 87°30′22″E, 1 male, 6.ix.1987, light trap, C. Deng.

**Remarks.** *Metriocnemus (M.) beringiensis* may be no more than a small form of *M. (M.) fuscipes* (Meigen, 1818) differing in having a strongly reduced or absent anal
point and slightly fewer setae on squama. Chinese specimens have fewer setae (R with 18–28, R, with 18–20, R3+4 with 15–38 setae) on the wing than Norwegian specimens (R with 39–69, 55, R1 with 27–47, 36, R3+4 with 37–81, 59 setae) (Sæther 1995).

**Distribution.** The species is previously recorded from the Nearctic and Palaearctic regions (Ashe and O’Connor 2012). In China it was collected in Tibet in Oriental China for first time.

**Metriocnemus (Metriocnemus) bilobatus** Makarchenko & Makarchenko
http://species-id.net/wiki/Metriocnemus_bilobatus

Metriocnemus bilobatus Makarchenko & Makarchenko, 2004:216

**Material examined.** CHINA: Sichuan Province, Kangding City, Ertaizidaoban, 30°2’20”N, 101°50’6”E, 1 male, 15.vi.1996, water net, X. Wang. Sichuan Province, Litang County, 29°59’45”N, 100°16’11”E, 1 male, 11.vi.1996, light trap, X. Wang.

**Remarks.** This species can be separated from other Metriocnemus species by having a total length of 2.18–2.42 mm, wing length of 1.85–2.25 mm, AR = 0.23–0.26, acrostichals in 2 rows, 25–37 dorsocentrals, and reduced anal lobe of the wing. The anal point is 45–48 µm long, and lacking microtrichia in distal half. Virga is 50–53 µm long and consists of a single spine. The inferior volsella is bilobate, and the length of the basal lobe is about half the length of the gonocoxite.

**Distribution.** The species is recorded from Russian Far East (Makarchenko and Makarchenko 2004). In China it was collected in Sichuan Province in Oriental China for first time.

**Metriocnemus (Metriocnemus) brusti** Sæther
http://species-id.net/wiki/Metriocnemus_brusti

Metriocnemus brusti Sæther, 1989:407; Wang (2000:637).

**Material examined.** CHINA: Hebei Province, Pingquan County, Guangtou Mountain, 41°1’43”N, 118°43’1”E, 1 male, 29.vi.1995, light trap, H. Li. Guizhou Province, Dazhen County, Xiaosha River, 29°10’45”N, 107°32’59”E, 1 male, 25.v.2004, light trap, H. Tang.

**Remarks.** According to Sæther (1989), the male can be separated from other members of Metriocnemus by having rounded crista dorsalis, anal point tapering to blunt apex, well sclerotized virga, comparatively sparsely haired wing with about 0–8 setae on Sc, 0–11 on M, 0–14 on PCu and 7–9 setae in cell m, and squama with 27–34 setae. The Chinese specimens have slightly more setae on wing membrane, with about 2–9 setae on Sc, 12–14 on M, 35–48 on PCu and 13–16 setae in cell m, but squama only with 15-17 setae. The species is similar to M. (M.) albilineatus (Meigen,
New species and records of Metriocnemus van der Wulp s. str. from China...

1818) and M. (M.) eurynotus, but has tapering anal point and rounded crista dorsalis. It has a well developed virga as in M. (M.) corticalis and differs from this species in minor details in the wing chaetotaxy and the hypopygium.

**Distribution.** The species is recorded from the Nearctic and Palaearctic regions (Ashe and O’Connor 2012). It was collected in both Oriental and Palaearctic China.

*Metriocnemus (Metriocnemus) calcaneum* sp. n.
http://zoobank.org/2A5C2FA0-54B9-46E6-90BA-A6D3FD4558C1
http://species-id.net/wiki/Metriocnemus_calcaneum
Figs 1–3

**Type material.** Holotype male (BDN No. 08832), CHINA: Hebei Province, Pingquan County, Guangtou Mountain, 41°1'43"N, 118°43'1"E, 29.vi.1995, light trap, W. Bu. Paratype male (BDN No. 08816), as holotype except the date is 28.vi.1995.

**Diagnostic characters.** The gonostylus is 83–90 µm long, with short, strong outer projection; crista dorsalis is strong and pointed; LR₁ is high (0.68–0.70); squama with 8–10 setae; and cell m basally of RM with 15 setae.

**Etymology.** From Latin, *calcaneum* meaning the heel, referring to the short, strong outer projection on gonostylus. The species epithet is a noun in apposition.

**Description.** Male (n = 2).

Total length 2.49–2.68 mm. Wing length 1.68–1.88 mm. Total length / wing length 1.43–1.48. Wing length / length of profemur 2.09–2.23.

**Coloration.** Head and abdomen brown, thorax and legs yellow.

**Head.** AR 1.43–1.58. Temporal setae 11, including 4 inner verticals, 3 outer verticals, and 4 postorbitals. Clypeus with 10–12 setae. Tentorium 123–150 µm long, 18–20 µm wide. Stipes 105–108 µm long, 25–40 µm wide. Palp segments lengths (in µm): 18–40, 43, 135–155, 105–118, 153–165. Length ratio of palpomere 5/3 1.06–1.13.

**Wing** (Fig. 1). VR 1.16–1.34. Costal extension 110–150 µm long. Brachiolum with 1 seta, C extension with 8 non-marginal setae, Sc with 2–3, R with 18–19, R₁ with 16–17, R₄,₅ with 25–32, RM with 1, M with 0–2, M₁,₂ with 26, M₃,₄ with 20, Cu with 0, Cu₁ with 7 setae. Pcu and An without setae. Wing membrane with setae in most cells, with 15 setae in cell m basally of RM, cell r₄,₅ with 74–105, cell m₁,₂ with 108–135, cell m₃,₄ with 21–38 setae. Squama with 8–10 setae.

**Thorax.** Antepronotum with 1–2 setae. Dorsocentrals 10–12, acrostichals 8–9, prealars 5. Scutellum with 7–8 setae.

**Legs.** Spur of fore tibia 53–75 µm long, spurs of mid tibia 33–35 µm and 25–28 µm long, of hind tibia 53–58 µm and 28 µm long. Width at apex of fore tibia 38–43 µm, of mid tibia 35–43 µm, of hind tibia 45–50 µm. Comb of 12 setae, shortest 20–23 µm long, longest 50–63 µm long. First tarsomere of mid leg with 1 pseudospur, 20 µm long; hind leg without pseudospurs. Lengths (in µm) and proportions of legs as in Table 1.
Table 1. Lengths (in µm) and proportions of legs segments of *Metriocnemus (Metriocnemus) calcaneum* sp. n., male (n = 2).

Hypopygium (Figs 2–3). Anal point proper 30–45 µm long, 23–25 µm wide, tapering from base to pointed apex; with 8–11 setae at base on tergite IX. Laterosternite IX with 10–13 setae. Phallapodeme 48–53 µm long; transverse sternapodeme 110–133 µm long. Gonocoxite 223–224 µm long. Gonostylus 83–90 µm long, with short, strong outer projection; crista dorsalis strong and pointed; megaseta 13 µm long. HR 2.49–2.70. HV 2.76–3.24.

**Distribution.** The specimens were collected in Hebei Province in Palaearctic China.

*Metriocnemus (Metriocnemus) calvescens* Sæther

http://species-id.net/wiki/Metriocnemus_calvescens

*Metriocnemus calvescens* Sæther, 1995:45; Wang (2000:637).

**Material examined.** CHINA: Qinghai Province, Menyuan County, Haibei Station, 37°22'33"N, 101°37'20"E, 3 males, 12.vii.1989, light trap, M. Wei.

**Remarks.** This species apparently forms the sister species of *M. ursinus* (Holmgren, 1869). It can be separated from *M. (M.) ursinus* on its smaller size, by having only 27 setae in cell r_{4+5}, only 26 setae on scutellum, and the presence of pseudospurs on fore metatarsus (Sæther 1995). Compare to the holotype, the measurements of the two more males are very similar, except only 8-15 setae on scutellum.

**Distribution.** The species was described by Sæther (1995) in Qinghai Province in Palaearctic China based on a single male specimen. Later two more male slides have been made which collected in the same location as the holotype.

*Metriocnemus (Metriocnemus) caudigus* Sæther

http://species-id.net/wiki/Metriocnemus_caudigus

*Metriocnemus caudigus* Sæther, 1995:52; Wang (2000:367).

**Material examined.** CHINA: Fujian Province, Wuyi Mountain, 27°43'46"N, 118°1'52"E, 1 male, 28.iv.1993, light trap, X. Wang.

**Remarks.** This species can be separated from other species of *Metriocnemus* by having a slender gonostylus with long, low crista dorsalis; a robust, long anal point; and an AR of 1.0–1.5. The Chinese specimen has a slightly higher 5^{th}/3^{rd} palp ratio (0.79–0.94) than the Norwegian specimens (0.70). Further, the Chinese specimen has 2 pseudospurs, 24–32 µm long, on tarsomere 1 and 1 pseudospur, 20–28µm long on tarsomere 2 of mid and hind legs, while the Norwegian specimens have 1 pseudospur, 23–38 µm long, on tarsomere 1 of mid and hind legs only.

**Distribution.** The species was described from Norway by Sæther (1995). In China it was collected in Fujian Province in Oriental China.
**Metriocnemus (Metriocnemus) dentipalpus** Sæther
http://species-id.net/wiki/Metriocnemus_dentipalpus

*Metriocnemus dentipalpus* Sæther, 1995:44

**Material examined.** Holotype (ZMB No.145): CHINA: Tibet, Dingri, Chang Street, 28°39’31”N, 87°7’34”E, 1 male, 16.ix.1987, light trap, C. Deng.

**Remarks.** The species is similar to *M. (M.) brusti* Sæther, 1989 and *M. (M.) acutus* Sæther, 1995 but can be separated on having 20 setae on vein M, an AR = 1.43, palp with a small apical tooth on each of palpomeres 3 and 4, anal point with concave margins and details of the hypopygium. *M. (M.) brusti* only have 0–14 setae and *M. (M.) acutus* without setae on vein M.

**Distribution.** The species is known only from Tibet in Oriental China by Sæther (1995).

---

**Metriocnemus (Metriocnemus) eurynotus** (Holmgren)
http://species-id.net/wiki/Metriocnemus_eurynotus

*Chironomus obscuripes* Holmgren, 1869:8, preoccupied

*Chironomus eurynotus* Holmgren, 1883:179

*Metriocnemus eurynotus* (Holmgren); Sæther (1995:44); Wang (2000:637)

**Material examined.** CHINA: Gansu Province, Yuzhong County, 35°50’35”N, 104°6’45”E, 1 male, 8.viii.1993, light trap, X. Wang. Sichuan Province, Jinfo Mountain, 30°3’30”N, 103°53’15”E, 1 male, 9.v.1986, light trap, X. Wang.

**Remarks.** The male can be recognized on the completely parallel–sided anal point with broad, rounded apex; and the sharply triangular crista dorsalis.

**Distribution.** The species is recorded from the Nearctic, Palaearctic and Oriental regions (Ashe and O’Connor 2012). The species has been collected in both Oriental and Palaearctic China.

---

**Metriocnemus (Metriocnemus) fuscipes** (Meigen)
http://species-id.net/wiki/Metriocnemus_fuscipes

*Chironomus fuscipes* Meigen, 1818:49

*Metriocnemus fuscipes* (Meigen); van der Wulp (1875:136); Sæther (1989:423, 1995:58); Wang (2000:637)

**Material examined.** CHINA: Ningxia Hui Autonomous Region, Liupan Mountain, 35°47’22”N, 106°17’36”E, 1 male, 4.viii.1987, light trap, W. Wang. Liaoning Province,
Changbai Mountain, 41°2′40″N, 122°37′38″E, 1 male, 1.v.1994, light trap, X. Wang. Tibet, Yadong County, 27°29′5″N, 88°54′25″E, 1 male, 29.viii.2003, light trap, H. Xue.

Remarks. This species is easily recognized by the lack of virga, pointed anal point, low inferior volsella with apical hump, LR only 0.38–0.39 and AR = 0.9–1.2 (Sæther 1989). The Chinese specimens have a slightly higher AR (1.28–1.42) than that given by Sæther (1989) (AR = 0.86–1.17).

Distribution. The species is recorded from the Nearctic and Palaearctic regions (Ashe and O’Connor 2012). In China the species was collected in Palaearctic China.

Metriocnemus (Metriocnemus) intergerivus Sæther
http://species-id.net/wiki/Metriocnemus_intergerivus

Metriocnemus intergerivus Sæther, 1995:52

Material examined. CHINA: Hubei Province, Enshi Tujia and Miao Autonomous Prefecture, He Mountain, Fenshuiling, 29°53′24″N, 110°2′1″E, 2 males, 12–16. vii.1999, light trap, B. Ji. Hubei Province, Enshi Tujia and Miao Autonomous Prefecture, Xianfeng County, Pingba, 29°24′57″N, 109°8′18″E, 2 males, 20.vii.1999, light trap, B. Ji. Liaoning Province, Changbai Mountain, 41°2′40″N, 122°37′38″E, 2 males, 1.v.1994, light trap, X. Wang. Sichuan Province, Daocheng County, Sangdui, 29°11′28″N, 100°6′32″E, 1 male, 13.vi.1996, light trap, X. Wang.

Remarks. The male imago combines a well developed virga with a low crista dorsalis, weak anal point, and low inferior volsella typical of the fuscipes group. The species has an AR = 1.78–2.42.

Distribution. The species is recorded from the Nearctic and Palaearctic regions (Ashe and O’Connor 2012). It is known from both Oriental and Palaearctic China for first time.

Metriocnemus (Metriocnemus) picipes (Meigen)
http://species-id.net/wiki/Metriocnemus_picipes

Chiromomus picipes Meigen, 1818
Chironomus paganicus Walker, 1856:183
Metriocnemus hirtipalpis Kieffer, 1915:478
Metriocnemus longipalpus Sinharay & Chaudhuri, 1978:281
Metriocnemus picipes (Meigen); van der Wulp (1874:136); Edwards (1929:311); Pinder (1978:90), Sæther (1995:59); Wang (2000:637)

Material examined. CHINA: Jilin Province, Changbai Mountain, 41°2′40″N, 122°37′38″E, 1 male, 7.vii.1986, light trap, X. Wang. Yunan Province, Songhua Coun-
ty, 25°11'38"N, 109°8'18"E, 1 male, 1.vi.1996, light trap, B. Wang. Hebei Province, Pingquan County, Guangtou Mountain, 41°1'43"N, 118°43'1"E, 1 male, 29.vi.1995, light trap, H. Li. Sichuan Province, Daocheng County, Sangdui, 29°11'28"N, 100°6'32"E, 2 males, 13.vi.1996, light trap, X. Wang. Hubei Province, Deduo Mountain, Fenshui ling, 29°40'8"N, 109°5'12"E, 1 male, 16.vi.1999, light trap, B. Ji.

**Remarks.** The Chinese specimens have a low number of setae on each of subcosta (0–9, 2) and M (4–20, 12), combined with a high AR (1.89–2.90, 2.24) and LR3 (0.44–0.50, 0.46), and a conspicuously long spur of the fore tibia (2.0–2.4 times as long as the apical width of tibia), these characters will distinguish the species from other members of *Metriocnemus*. *Metriocnemus wittei* Freeman, 1955 from Africa might be a synonym (Sæther 1995).

**Distribution.** The species is recorded from the Nearctic, Palaearctic and Oriental regions (Ashe and O’Connor 2012). It has been collected in both Oriental and Palaearctic China.

Yunnan Province, Dali County, Yinqiao, 25°45'10"N, 109°5'12"E, 1 male, 21.v.1996, light trap, B. Wang. Xinjiang Uygur Autonomous Region, Yining City, Saimuli Lake, 44°37'26"N, 81°12'28"E, 1 male, 30.vii.2000, light, trap, N. Tang.

**Remarks.** The species has an AR = 1.13; very long palp; wing with numerous macrotrichia; ta1 and ta2 of mid and hind leg each with 2 pseudospurs; virga composed of nearly 20 spines; anal point robust, partly parallel–sided; a strongly projecting, rectangular inferior volsella in basal half of the gonocoxite; and a triangular, preapical cristal dorsalis.

**Distribution.** The species was described from Japan (Sasa 1983), and it is a newly recorded in China. It is known from both Oriental and Palaearctic China.

*Metriocnemus (Metriocnemus) tristellus* Edwards

http://species-id.net/wiki/Metriocnemus_tristellus

*Metriocnemus tristellus* Edwards, 1929:312
*Metriocnemus gracei* Edwards, 1929:312 sensu Wang 2000:637.

**Material examined.** CHINA: Zhejiang Province, Qingyuan City, Baishanzu County, 27°43'51"N, 100°7'33"E, 2 males, 18–22.iv.1994, light trap, H. Wu.
Remarks. The species has an AR = 1.2, very low inferior volsella, and weak anal point. Basal half of the wing membrane is bare, costa is strongly produced, and the distance C–M is rather less than M–Cu. The palp is unusually short, palpomeres 3 and 4 are less than three times as long as broad, palpomere 2 is rather longer. Wang (2000) recorded *M. gracei* Edwards, 1929 from China, which should be *M. (M.) tristellus* Edwards after we re-examined the specimen.

Distribution. The species is recorded from the Nearctic and Palaearctic regions (Ashe and O’Connor 2012). The species has been collected in Oriental China for first time.

*Metriocnemus (Metriocnemus) unilinearis* Chaudhuri & Bhattacharyay

http://species-id.net/wiki/Metriocnemus_unilinearis

*Metriocnemus unilinearis* Chaudhuri & Bhattacharyay in Chaudhuri et al. 1989:312; Sæther (1995:56); Wang (2000:637)

Material examined. CHINA: Tibet, Zhangmu, 28°46′26″N, 87°30′22″E, 1 male, 7.ix.1987, light trap, C. Deng. Tibet, Zhangmu, 28°46′26″N, 87°30′22″E, 1 male, 21.ix.1987, light trap, C. Deng. Tibet, Zhangmu, 28°46′26″N, 87°30′22″E, 1 male, 9.viii.1987, light trap, C. Deng. Guizhou Province, Fanjing Mountain, Huguo Temple, 27°54′43″N, 108°38′35″E, 1 male, 4.viii.2001, light trap, R. Zhang. Fujian Province, Wuyi Mountain, Tongmu County, 27°43′46″N, 118°1′52″E, 2 males, 29.iv.1993, sweep net, W. Bu.

Remarks. This species can be separated from other *Metriocnemus* species by the following combination of characters: acrostichals 4–5, uniserial; scutellum with 12 irregularly arranged setae; squama with 7 setae; anal point narrow and pointed with 14 setae at base, and gonocoxite with a small, dorsal, flap–like setose lobe. The specimens from Tibet have a lower antennal ratio (AR = 0.66–0.88) than the Indian specimens (AR = 1.03).

Distribution. This species was described from India (Chaudhuri et al. 1989). It has been collected in both Oriental and Palaearctic China.

*Metriocnemus (Metriocnemus) wangi* Sæther

http://species-id.net/wiki/Metriocnemus_wangi

*Metriocnemus wangi* Sæther, 1995:41; Wang (2000:637)

Material examined. CHINA: Sichuan Province, Jinfo Mountain, 30°3′30″N, 103°53′15″E, 2 males [holotype / paratype], 10.v.1986, light trap, X. Wang.

Remarks. We examined the holotype and paratype specimens which are described by Sæther (1995) from China. According to Sæther (1995), the male can be separated from all other members of the *euryotus* group except *M. (M.) albolineatus* by the short
virga (about 26µm long), subcosta with 42–70 setae, and cell m with 113–144 setae. The species is close to *M. (M.) albolineatus* sharing the short virga and general wing chaetotaxy. It differs from *M. (M.) albolineatus* by having an AR = 0.5–0.6 and a much shorter anal point.

**Distribution.** This species was only described from Oriental China by Sæther (1995).

**Key to adult males of *Metriocnemus* s. str. in China**

1. Gonostylus with short, strong outer projection. ... *M. (M.) calcaneum* sp. n.
   - Gonostylus without strong outer projection ........................................ 2

2. Basal half of wing membrane bare or at most with scattered setae in anal cell. 3
   - Entire wing membrane, except sometimes cell m basally of RM, densely clothed with setae .......................... 6

3. AR = 0.23–0.26; virga consists of 1 spine ........................................
   - AR = 0.84–2.71; without virga or virga consists of about 10 spines 4

4. Anal point weak, tapering to a point; a few setae present in anal cell of wing; crista dorsalis low or absent, squama with about 4–11 setae ............... 5
   - Anal point robust, rounded apically; basal half of wing membrane bare; crista dorsalis bluntly triangular; squama with 27 setae ... *M. (M.) calvescens* Sæther

5. Inferior volsella very low; without virga .................. *M. (M.) tristellus* Edwards
   - Inferior volsella distinct; virga present ........................................
   - *M. (M.) aculeatus* Chaudhuri & Bhattacharyay

6. Virga consisting of 6–14 spines; crista dorsalis preapical and triangular or occasionally long and low or gonostylus with strong preapical projection ....... 7
   - Virga absent, crista dorsalis long and low .................................. 14

7. Crista dorsalis long and low .......................................................... 8
   - Crista dorsalis preapical, triangular, pointed to rounded ........... 9

8. Anal point robust, rounded at apex, 49–68 µm long; AR about 1.3; squama with 18–23 setae .................................................. *M. (M.) caudigus* Sæther
   - Anal point weak, pointed, 15–26 µm long; AR = 2.0–2.4; squama with 43–64 setae .................................................. *M. (M.) intergerivus* Sæther

9. Inferior volsella in basal half of gonocoxite, rectangular, strongly projecting ... .................................................. *M. (M.) tamaokui* Sasa
   - Inferior volsella in basal 0.58–0.80 of gonocoxite, widest in basal half, weak to pronounced .................................................. 10

10. Subcosta with 0–8 setae, cell m basally of RM with 0–29 setae .......... 11
   - Subcosta with 10–55 setae, cell m basally of RM with 40–144 setae ... 12

11. Vein M with 0–11 setae, third and fourth palpomere without small, sclerotized apical tooth; anal point triangular .................. *M. (M.) brusti* Sæther
   - Vein M with about 20 setae, third and fourth palpomere with small, sclerotized apical tooth; anal point with concave margins ........ *M. (M.) dentipalpus* Sæther
New species and records of Metriocnemus van der Wulp s. str. from China... 85

12  Spines of virga 23–26 µm long, crista dorsalis rounded to bluntly triangular.... 13
– Spines of virga 34–68 µm long, crista dorsalis either sharply triangular or rounded.................................................. M. (M.) eurnotus (Holmgren)
13  AR = 0.5–0.6, anal point 24–28 µm long .............. M. (M.) wangi Sæther
– AR = 1.2–1.5, anal point 51–64 µm long ... M. (M.) albolineatus (Meigen)
14  LR₁ = 0.55–0.67, LR₃ = 0.37–0.49, squama with 19–46 setae .......... M. (M.) uninearis Chaudhuri & Bhattacharyay
– LR₁ about 0.66–0.88, LR₃ about 0.54–0.59, squama with 7–10 setae........
.......................................... M. (M.) picipes (Meigen)
15  AR = 0.70–1.42; pseudospurs often absent on ta₂ of hind leg .......... M. (M.) berinogenis (Cranston & Oliver)
– AR = 1.89–2.49; pseudospurs always present on ta₂ of hind leg........
.......................................... M. (M.) fuscipes (Meigen)
16  Anal point absent or at most 15 µm long; LR₁ = 0.81–0.84.................
.......................................................... M. (M.) fuscipes (Meigen)

Acknowledgements

We are indebted to Trond Andersen, University Museum of Bergen, for valuable advice and discussions. Mr. Ji Bing-Chun, Mrs. Li Yu-Fen made the slide preparations. Financial support received from the National Natural Science Foundation of China (NSFC) (grant No. 30770249, 30870329, 31272284, J0630963), Zhejiang Provincial National Science Foundation of China (Y3100486) and Fauna of China (FY120100) are thankfully acknowledged.
