1. Introduction

Recently, enterprise cluster, as an effective form of industrial space organization, has gradually become a common phenomenon in the process of modern industry and internationalization [1–4]. The competition-cooperation relationship widely exists in the real enterprise clusters and has a major impact on the evolution of enterprise clusters [5–9]. To study the influence of competition and cooperation on the evolution of enterprise clusters, researchers propose a competition-cooperation enterprise cluster model [10] based on the ecology model [11–15], which is described as follows:

\[
\begin{align*}
\dot{x}_1(t) &= r_1 x_1(t) \left( 1 - \frac{x_1(t)}{K_1} - \frac{\alpha (x_2(t - \tau) - c_2)^2}{K_2} \right), \\
\dot{x}_2(t) &= r_2 x_2(t) \left( 1 - \frac{x_2(t)}{K_2} + \frac{\alpha (x_1(t - \tau) - c_1)^2}{K_1} \right),
\end{align*}
\]
where \( x_1, x_2 \) are the enterprise output; \( r_i \) is the intrinsic growth; \( K_i (i = 1, 2) \) denotes the carrying capacity of market under nature unlimited conditions; \( c_i (i = 1, 2) \) is the initial output of core enterprise; and \( \tau \) is the production period. Let \( a_1 = (r_1/K), a_2 = (r_2/K), b_1 = (r_1\alpha/K), b_2 = (r_2\beta/K) \), and system (1) can be rewritten as follows:

\[
\begin{align*}
\dot{x}_1 (t) &= x_1 (t) \left( r_1 - a_1 x_1 (t) - b_1 x_2 (t) - c_1 (y (t) - d)^2 \right), \\
\dot{x}_2 (t) &= x_2 (t) \left( r_2 - a_2 x_2 (t) - b_2 x_1 (t) - c_2 (y (t) - d)^2 \right), \\
\dot{y} (t) &= y (t) \left( r_3 - a_3 y (t) + c_2 \left( (x_1 (t) - d_1)^2 + (x_2 (t) - d_2)^2 \right) \right),
\end{align*}
\]

For this model, the dynamic behaviors including stability, Hopf bifurcation, and chaos have been widely studied [16–21].

In practical enterprise clusters, organization structure has a major impact on the production efficiency of enterprise clusters. The efficiency of overall operation is one of the important factors of enterprise’s success. Thus, it is necessary to consider the structure in the enterprise cluster model. Among the many organization structures, core and satellite structure is one of the common structures in enterprise clusters, which is described in Figure 1. In core and satellite structure, there are one core enterprise and at least two satellite enterprises. There exist competitive relationship among satellite enterprises and cooperative relationship between satellite enterprise and core enterprise. For example, in automobile enterprise cluster, the core enterprise produces the motor vehicle and the satellite enterprise produces automobile parts for core enterprises. To reduce the cost and ensure the stability of supply chain, the core enterprise has at least two satellite enterprises for the same automobile part. It is easy to see that there exists competition between the two satellite enterprises and there exists cooperation between satellite enterprise and core enterprise. However, few works investigate the dynamic evolution of enterprise cluster model with core-satellite structure.

Inspired by the discussion, in this paper, a competition-cooperation enterprise cluster model composed of a core enterprise and two satellite enterprises is proposed, which is shown in Figure 1. In this enterprise cluster, there are one core enterprise and two satellite enterprises. There is a competitive relationship between two satellite enterprises. And there is a cooperative relationship between satellite enterprise and core enterprise. The model is described as follows:

\[
\begin{align*}
\dot{x}_1 (t) &= x_1 (t) \left( r_1 - a_1 x_1 (t) - b_1 x_2 (t) - c_1 (y (t) - d)^2 \right), \\
\dot{x}_2 (t) &= x_2 (t) \left( r_2 - a_2 x_2 (t) - b_2 x_1 (t) - c_1 (y (t) - d)^2 \right), \\
\dot{y} (t) &= y (t) \left( r_3 - a_3 y (t) + c_2 \left( (x_1 (t) - d_1)^2 + (x_2 (t) - d_2)^2 \right) \right),
\end{align*}
\]

where \( x_i (t) \) is the satellite enterprise output; \( y (t) \) is the core enterprise output; \( a_i \) is the self-regulation of enterprise \( i \); \( r_i \) is the intrinsic growth; \( b_i \) is the completion rate of satellite enterprise; \( c_i \) is the completion rate between satellite enterprise and core enterprise; \( c_2 \) is the rate of conversion of commodity into the reproduction of enterprise; \( d \) is the initial output of core enterprise; \( d_1 \) is the initial output of satellite enterprise \( x_1 \); \( d_2 \) is the initial output of satellite enterprise \( x_2 \); and \( \tau \) is the production period. The main contributions of this paper are as follows:

1. A competition-cooperation enterprise cluster model is composed of a core enterprise and two satellite enterprises. There is a competitive relationship between two satellite enterprises. And there is a cooperative relationship between satellite enterprise and core enterprise.

2. The boundedness of positive equilibrium is investigated. And there exists a upper limit of output of enterprise cluster model.

3. The production period plays a key role in dynamics of the proposed enterprise cluster. When it passes a critical value, the output of the enterprise cluster system loses its stability and displays a periodic fluctuation, which may cause a drop in productivity of the enterprise cluster system.

The remainder of this paper is organized as follows. In Section 2, the boundedness analysis of positive equilibrium is given. In Section 3, the conditions of Hopf bifurcation are discussed. In Section 4, the normal form of Hopf bifurcation is given. In Section 5, an example is given to verify the theoretical analysis. In Section 6, we give the economic meaning.

2. Boundedness of Positive Equilibrium

In this section, we investigate the boundedness of positive equilibrium. It can be seen that system (3) has more than three equilibria if any one of the enterprise output is zero. As it has no economic sense if one of the enterprise output is zero, we only study the property of positive equilibrium.
where all enterprise outputs are positive. Let \( E^* = (x_1^*, x_2^*, y^*) \) be the positive equilibrium of system (3), where

\[
\begin{align*}
x_1^* &= \frac{(a_2 r_1 - b_1 r_2) - \theta}{\theta} \left( (y^* - d)^2 \right), \\
x_2^* &= \frac{(b_2 r_1 - a_1 r_2) - \theta}{\theta} \left( (y^* - d)^2 \right), \\
y^* &= \frac{r_3 + c_2}{{\frac{\partial}{\partial \theta}}}(\frac{\partial x^*}{\partial \theta})^2 + (\frac{\partial x^*}{\partial \theta})^2.
\end{align*}
\]

From the perspective of enterprise management, the output of enterprise cannot be negative. Thus, the initial condition of enterprise output must satisfy \( x_1(\theta) \geq 0, \ x_2(\theta) \geq 0, \) and \( y(\theta) \geq 0 \) for \( \theta \in [-\theta, 0] \). In respect of the boundedness of \( E^* = (x_1^*, x_2^*, y^*) \), we have the following lemma.

**Lemma 1** (see [21]). Let \( c > 0, d > 0 \).

1. If \( (ax(t)/dt) \geq x(d - cx) \) is satisfied, then \( \lim_{t \to -\infty} inf x(t) \geq (d/c) \) for all \( t \geq 0 \) and \( x(0) > 0 \).
2. If \( (ax(t)/dt) \leq x(d - cx) \) is satisfied, then \( \lim_{t \to -\infty} sup x(t) \leq (d/c) \) for all \( t \geq 0 \) and \( x(0) > 0 \).

**Theorem 1**

1. Suppose \( x_1(\theta) \geq 0, (i, 1, 2), \theta \in [-\theta, 0] \) and \( x_1(0) \) \( > 0, (i, 1, 2), t > 0 \); there exists \( \psi_1 = \psi_1(x_1(\theta)) \) \( > 0, (i, 1, 2) \) such that \( x_1(t) < \psi_1, (i, 1, 2), \) where \( \psi_1 = \min \{ max[sup_{-\theta, 0} x(t), \min{r_1, a_1} \}, (r_1/a_1) \} \).
2. Suppose \( y(\theta) \geq 0, \theta \in [-\theta, 0] \) and \( y(0) > 0, t > 0 \); there exists \( \psi_3 = \psi_3(y(\theta)) > 0, \) such that \( y(t) < \psi_3, \) where \( \psi_3 = \min \{ sup_{-\theta, 0} y(t), \min{r_1 - a_1, a_2} \psi_2 \} \).

**Proof.** First, we investigate the boundedness of \( x_1(t) \) and \( x_2(t) \). By (3), one can obtain \( x_1(t) \geq 0 \) for all \( t \geq T \). Then, we have

\[
\frac{dx_1}{dt} \leq x_1(t)(r_1 - a_1 x_1).
\]

According to Lemma 1, one has

\[
\lim_{t \to -\infty} sup x_1 \leq \frac{r_1}{a_1}.
\]

Similarly, one has

\[
\lim_{t \to -\infty} sup x_2 \leq \frac{r_2}{a_2}.
\]

If there exists \( \{ t_n \}_{n=1}^\infty \) such that \( x_1(t_n) \geq 0 \) is local max, where \( x_1(t) < x_1(t_n), t \in (0, t_n), \) using the same method, one can obtain that \( x_1(t) \) has upper limit at \( t = t_n \). Thus, one has \( \psi_1 = \max \{ sup_{-\theta, 0} x_1(\theta), (r_1/a_1) \} \). Similarly, we also can obtain \( \psi_2 = \max \{ sup_{-\theta, 0} x_2(\theta), (r_2/a_2) \} \).

In this same way, it follows that there exists \( \psi_3 > 0, \) such that \( y(t) < \psi_3, \) for \( t > 0, \) where \( \psi_3 = \max \{ sup_{-\theta, 0} y(t), \min{r_1 - a_1, a_2} \psi_2 \} \). We complete the proof.

**Remark 1.** From Theorem 1, one can see that there are upper bounds on the output of core enterprise and two satellite enterprises. Moreover, the upper bound of core enterprise not only depends on its own production capacity but also depends on the production capacity of two satellite enterprises.

### 3. Bifurcation Analysis

In this section, the conditions of Hopf bifurcation for (3) with \( E^* = (x_1^*, x_2^*, y^*) \) are presented. By (3), one can obtain the Jacobian matrix for (3) with \( E^* : \)

\[
\begin{pmatrix}
-a_1 x_1^* & -b_1 x_1^* & -2c_1 x_1^* (y^* - d) e^{-\lambda t} \\
-b_2 x_2^* & -a_2 x_2^* & -2c_1 x_2^* (y^* - d) e^{-\lambda t} \\
-2c_2 y^* (x_1^* - d_1) e^{-\lambda t} & -2c_2 y^* (x_2^* - d_2) e^{-\lambda t} & -a_3 y^*
\end{pmatrix}
\]

Then, we have

\[
\lambda^3 + e_1 \lambda^2 + e_2 \lambda + e_3 + e^{-2\lambda t} (e_4 \lambda + e_5) = 0,
\]

where

\[
\begin{align*}
e_1 &= a_1 x_1^* + a_2 x_2^* + a_3 x_3^*, \\
e_2 &= a_3 y^* (a_2 x_1^* + a_1 x_1^*) + x_1^* x_2^* (a_1 a_2 - b_1 b_2), \\
e_3 &= -4c_1 c_2 y^* (y^* - d_1) [x_1^* (x_1^* - d_1) - x_2^* (x_2^* - d_1)], \\
e_4 &= 4c_1 c_2 x_1^* x_2^* y^* (x_1^* - d_1) (y^* - d_1) (b_1 - a_1) + 4c_1 c_2 x_1^* x_2^* y^* (x_2^* - d_1) (y^* - d_1) (b_2 - a_2), \\
e_5 &= a_3 x_1^* x_2^* y^* (a_1 a_2 - b_1 b_2).
\end{align*}
\]
If $i\omega (\omega > 0)$ is a root of (9), one can obtain

$$-i\omega^3 - e_i\omega^2 + e_j i\omega + e_k |\omega|^2 e^{-2i\omega} + e_0 e^{-2i\omega} + e_5 = 0. \quad (11)$$

Separating the real and imaginary parts of (11), we have

$$e_3\omega \sin 2\omega + e_4 \cos 2\omega = e_1\omega^2 - e_5, \quad (12)$$

$$e_3\omega \cos 2\omega - e_4 \sin 2\omega = \omega^3 - e_5 \omega. \quad (13)$$

By (12) and (13), one can obtain

$$\omega^6 + f_1 \omega^4 + f_2 \omega^2 + f_3 = 0, \quad (14)$$

where $f_1 = e_1^2 - 2e_2, f_2 = e_2 - 2e_1 e_5 - e_3^2, f_3 = e_5^2 - e_2^2$. Let $z = \omega^2$; then, (14) becomes

$$z^3 + f_1 z^2 + f_2 z + f_3 = 0. \quad (15)$$

Letting $z^* = (1/3) (-f_1 + \sqrt{f_1^2 - 3f_2}), h(z^*) = (z^*)^3 + f_1 (z^*)^2 + f_2 z^* + f_3$, we get the following.

**Lemma 2** (see [22–24]).

(i) If $f_3 < 0$, (15) has at least one positive root.

(ii) If $f_3 \geq 0$ and $f_1^2 - f_2 \leq 0$, (15) has no positive root.

(iii) If $f_3 \geq 0, f_1^2 - 3f_2 > 0, z^* > 0$, and $h(z^*) \leq 0$, (15) has positive roots.

Assume (14) has three positive roots $\omega_k = \sqrt{z_k^*}, k = 1, 2, 3$. By (12) and (13), we have

$$\frac{\cos 2\omega \tau}{\omega_1^2} = \frac{e_3 \omega^4 + e_4 e_5 \omega^2 - e_2 e_3 \omega^2 + e_4 e_5}{e_1 \omega^2 + e_4^2} + \frac{2j\pi}{2\omega_k} \quad (16)$$

Thus, denote

$$\tau_k^j = \frac{1}{2\omega_k} \cos \frac{e_3 \omega^4 + e_4 e_5 \omega^2 - e_2 e_3 \omega^2 + e_4 e_5}{e_1 \omega^2 + e_4^2} + \frac{2j\pi}{2\omega_k}, \quad (17)$$

where $k = 1, 2, 3, j = 0, 1, 2, ...$. Define $\tau_0 = \tau_k^0 = \min_{k=1,2,3} \{ \tau_k^0 \}, \omega_0 = \omega_k$.

Note that when $\tau = 0$, (9) becomes

$$\lambda^3 + 4e_1 \lambda^2 + (e_2 + e_3) \lambda + e_4 + e_5 = 0. \quad (18)$$

By using the Routh–Hurwitz criterion [16], one can obtain the condition that all roots of (18) have negative real parts.

$$(H1)e_1(e_2 + e_4) - (e_3 + e_5) > 0. \quad (19)$$

**Lemma 3** (see [25]). Consider the exponential polynomial

\[ P(\lambda, e^{-\lambda \tau_1}, \ldots, e^{-\lambda \tau_m}) = \lambda^m + \frac{p_1^{(1)} \lambda^{m-1} + \ldots + p_{m-1}^{(1)} \lambda + p_m^{(1)}}{e^{-\lambda \tau_1} + \ldots + e^{-\lambda \tau_m}} + \ldots + \frac{p_1^{(m)} \lambda^{m-1} + \ldots + p_{m-1}^{(m)} \lambda + p_m^{(m)}}{e^{-\lambda \tau_1} + \ldots + e^{-\lambda \tau_m}} \quad (20) \]

where $\tau_j \geq 0 (i = 1, 2, \ldots, m)$ and $(p_j^{(i)}) = (j = 1, 2, \ldots, m)$ are constants. As $(\tau_1, \tau_2, \ldots, \tau_m)$ vary, the sum of the order of the zeros of $P(\lambda, e^{-\lambda \tau_1}, \ldots, e^{-\lambda \tau_m})$ on the open right half plane can change only if a zero appears on or crosses the imaginary axis.

**Lemma 4.** If $h'(z_0) \neq 0$, then $\text{sgn} \left\{ \text{Re} \left[ (\lambda \frac{d}{d\lambda} )^{-1} \right] \right\}_{\tau = \tau_0} \neq 0$ when $\tau = \tau_0$ and the sign of $h'(z_0)$ is the same as the sign of $\text{Re} \left[ (\lambda \frac{d}{d\lambda} )^{-1} \right]_{\tau = \tau_0}$.

**Proof.** Differentiating (9) with respect to $\tau$ yields

\[ \{3\lambda^2 + 2e_1 \lambda + e_2 + [e_3 - 2\tau (e_2 \lambda + e_4)] e^{-2\lambda \tau} \} \quad \frac{d\lambda}{d\tau} = 2\lambda (e_2 \lambda + e_4) e^{-2\lambda \tau}. \quad (21) \]

For convenience, we denote $\omega_0$ and $\tau_0$ by $\omega$ and $\tau$; then, we have

\[ \left( \frac{d\lambda}{d\tau} \right)^{-1} = \left( \frac{3\lambda^2 + 2e_1 \lambda + e_2}{2\lambda (e_2 \lambda + e_4)} \right) e^{2\lambda \tau} + \frac{e_3}{2\lambda (e_2 \lambda + e_4)} - \frac{\tau}{\lambda} \quad (22) \]

Then, we get

\[ \text{Re} \left\{ \left( \frac{d\lambda}{d\tau} \right)^{-1} \right\}_{\tau = \tau_0} = \text{Re} \left\{ \left( \frac{3\lambda^2 + 2e_1 \lambda + e_2}{2\lambda (e_2 \lambda + e_4)} \right) e^{2\lambda \tau} + e_3 \left( \frac{1}{2\lambda (e_2 \lambda + e_4)} - \frac{\tau}{\lambda} \right) \right\}_{\tau = \tau_0} \]

\[ = \frac{1}{A_k} \left\{ -2\omega_0 (e_2 - 3e_0^2) (e_0^2 - e_4 \omega_0) + 4 \left( e_0^2 \right) (e_2 \omega_0^2 - e_5) - 2e_3 \omega_0^2 \right\} \]

\[ = \frac{1}{A_k} \left\{ -6 \omega_0 + 4 \omega_0^4 + 2f_1 \omega_0^2 \right\} \]

\[ = \frac{2}{A_k} \left[ \omega_0 (3\omega_0^2 + 2f_1 \omega_0 + f_2) \right] \]

\[ = \frac{2 \omega_0 h'(z_0)}{A_k} \quad (23) \]

where $A_k = 4e_1^2 \omega_0^4 + 4e_2^2 \omega_0^2 > 0$.

Then, if $h'(z_0) \neq 0$, we have $\text{sgn} \left\{ \text{Re} \left[ (\lambda \frac{d}{d\lambda} )^{-1} \right] \right\}_{\tau = \tau_0}$ and the sign of $h'(z_0)$ is the same as the sign of $\text{Re} \left[ (\lambda \frac{d}{d\lambda} )^{-1} \right]_{\tau = \tau_0}$. We complete the proof.

Thus, from Lemmas 2, 3, and 4, one has the following.
can be transformed into a FDE as by using the center manifold [23, 26–28]. Letting In this section, we study the properties of Hopf bifurcation

4. Direction of the Hopf Bifurcation

In this section, we study the properties of Hopf bifurcation by using the center manifold [23, 26–28]. Letting \( x_1 = x_1 - x_1^*, x_2 = x_2 - x_2^*, x_3 = x_3 - x_3^*, \xi(t) = x_i (\tau), \tau = \tau_0 + \mu, (3) \) can be transformed into a FDE as

\[
x(t) = L_\mu(x_i) + f(\mu,x_i),
\]

with

\[
L_\mu \phi = (\tau_0 + \mu) [B_1 \phi(0) + B_2 \phi(-1)],
\]

where

\[
f(\mu, \varphi) = (\tau_0 + \mu) \begin{pmatrix} f_1 \\ f_2 \\ f_3 \end{pmatrix},
\]

where

\[
f_1 = b_{14} \psi_1^2(0) + b_{15} \psi_1(0) \psi_2(0) + b_{16} \psi_3^2(-1) + b_{17} \psi_1(0) \varphi_3(-1) + b_{18} \psi_1(0) \varphi_3^2(-1),
\]

\[
f_2 = b_{24} \psi_1(0) \varphi_2(0) + b_{25} \varphi_2(0) \psi_3^2(-1) + b_{26} \varphi_2(0) \varphi_3(-1) + b_{27} \varphi_2(0) \varphi_3^2(-1) + b_{28} \varphi_2(0) \varphi_3^2(-1),
\]

\[
f_3 = b_{34} \varphi_1^2(-1) + b_{35} \varphi_1^2(-1) + b_{36} \varphi_1^2(0) + b_{37} \varphi_1(0) \varphi_3(-1)
\]

\[
+ b_{38} \varphi_2(-1) \varphi_3(0) + b_{39} \varphi_1^2(-1) \varphi_3(0) + b_{40} \varphi_1^2(-1) \varphi_3(0),
\]

\[
 b_{11} = -a_1 x_1^*, \\
 b_{12} = -b_1 x_1^*, \\
 b_{13} = -2c_1 x_1^* (y^* - d), \\
 b_{14} = -a_1, \\
 b_{15} = -b_1, \\
 b_{16} = -c_1 x_1^*, \\
 b_{17} = -c_1, \\
 b_{18} = -2c_1 d_1, \\
 b_{21} = -b_2 x_2^*, \\
 b_{22} = -a_2 x_2^*, \\
 b_{23} = -2c_1 x_2^* (y^* - d), \\
 b_{24} = -b_2, \\
 b_{25} = -a_2, \\
 b_{26} = -c_1 x_2^*, \\
 b_{27} = -2c_1 d_1, \\
 b_{28} = -c_1, \\
 b_{31} = -2c_2 y^* (x_1^* - d_1), \\
 b_{32} = -2c_2 y^* (x_2^* - d_2), \\
 b_{33} = -a_3 y^*, \\
 b_{34} = c_2 y^*, \\
 b_{35} = c_2 y^*.
\]
According to Riesz representation theorem, there exists a function $\eta(\theta, \mu)$ of bounded variation for $\theta \in [-1, 0]$, such that
\[
L_\mu \varphi = \int_{-1}^{0} d\eta(\theta, \mu) \varphi(\theta), \quad \varphi \in C. \tag{29}
\]
Let
\[
\eta(\theta, \mu) = (\tau_0 + \mu) [B_1 \delta(\theta) + B_2 \delta(\theta + 1)], \tag{30}
\]
where $\delta(\theta)$ is Dirac delta function.
By [21], we define
\[
A(\mu) \varphi = \begin{cases} 
\frac{d\varphi}{d\theta}, & \theta \in [-1, 0), \\
0, & \theta = 0,
\end{cases}
\tag{31}
\]
\[
R(\mu) \varphi = \begin{cases} 
0, & \theta \in [-1, 0), \\
f(\mu, \varphi), & \theta = 0.
\end{cases}
\tag{32}
\]
Then, system (24) can be rewritten as
\[
\dot{x}(t) = A(\mu)x_t + R(\mu)x_t, \tag{33}
\]
where $x_t(\theta) = x(t + \theta)$.
The adjoint operator $A^*$ of $A$ is defined by
\[
A^*(\mu) \psi = \begin{cases} 
-\frac{d\psi(s)}{d\theta}, & s \in (0, 1], \\
\int_{-1}^{0} d\eta^T(t, 0) \psi(-t), & s = 0,
\end{cases}
\tag{34}
\]
where $\eta^T$ is the transpose of the matrix $\eta$.
For $\varphi \in C^1[-1, 0]$ and $\psi \in C^1[0, 1]$, we define
\[
\langle \psi, \varphi \rangle = \overline{\psi}(0) \cdot \varphi(0) - \int_{\theta = -1}^{0} \int_{\xi = 0}^{\theta} \overline{\psi}(\xi - \theta) d\eta(\theta) \varphi(\xi) d\xi, \tag{35}
\]
where $\eta(\theta) = \eta(\theta, 0)$. We know that $\pm i\tau_0 \omega_0$ is an eigenvalue of $A(0)$, so $\pm i\tau_0 \omega_0$ is also an eigenvalue of $A^*(0)$. We can get
\[
q(\theta) = \begin{pmatrix} 1 \\ \beta \end{pmatrix} e^{i\tau_0 \omega_0 \theta}, \quad -1 < \theta \leq 0. \tag{36}
\]
By [21], we have
\[
Aq(0) = i\tau_0 \omega_0 q(0). \tag{37}
\]
Hence, one can obtain
\[
\alpha = \frac{b_{11} (i\omega_0 + b_{13}) + b_{31} e^{-2i\theta} \omega_0}{(i\omega_0 + b_{22})(i\omega_0 + b_{33}) + b_{32} b_{23} e^{-2i\theta} \omega_0}, \tag{38}
\]
\[
\beta = \frac{(b_{31} (i\omega_0 + b_{22}) - b_{21} b_{32}) e^{-i\theta} \omega_0}{(i\omega_0 + b_{22})(i\omega_0 + b_{33}) + b_{32} b_{23} e^{-2i\theta} \omega_0}. \tag{39}
\]
Assume that the eigenvector $q^*$ of $A^*$ is
\[
q^*(s) = \begin{pmatrix} \alpha^* \\ \beta^* \end{pmatrix} e^{i\tau_0 \omega_0 s}. \tag{40}
\]
By [21], we have
\[
A^* q(0) = -i\tau_0 \omega_0 q^*(0). \tag{41}
\]
Hence, we obtain
\[
\alpha^* = \frac{b_{13} (b_{21} + b_{23} (i\omega_0 - b_{13}))}{b_{12} b_{23} e^{-2i\theta} \omega_0 + b_{13} (i\omega_0 - b_{22})}, \tag{42}
\]
\[
\beta^* = \frac{(i\omega_0 - b_{11})(i\omega_0 - b_{22}) - b_{12} b_{21}) e^{i\theta} \omega_0}{(i\omega_0 - b_{22})(b_{13} + b_{21})}. \tag{43}
\]
Let
\[
\langle q^*, q \rangle = 1. \tag{43}
\]
Then, we can compute
\[
\langle q^*, q \rangle = q^*(0) \cdot q(0) - \int_{\theta = -1}^{0} \int_{\xi = 0}^{\theta} -q^*(\xi - \theta) d\eta(\theta) q(\xi) d\xi
\]
\[
= \frac{1}{\rho} \left(1 + \alpha \alpha^* + \beta \beta^* \right) - \int_{\theta = -1}^{0} \int_{\xi = 0}^{\theta} \frac{\theta}{\rho} e^{i\tau_0 \omega_0 \theta} \left[ (b_{11} + b_{21} \alpha^* + b_{12} \alpha + b_{22} \alpha \alpha^* + b_{33} \beta \beta^*) \delta(\theta) \right]
\]
\[ + \left( b_{31} \bar{\beta} + b_{32} a \bar{\beta} + b_{13} \beta + b_{23} \bar{\beta} \right) \delta (\theta + 1) \right] \, d\theta \, \xi \\
= \frac{1}{\rho} \left( 1 + a \alpha^* + b \beta^* \right) + \frac{\tau_0}{\rho} e^{-ir_0} \left( b_{31} \bar{\beta} + b_{32} a \bar{\beta} + b_{13} \beta + b_{23} \bar{\beta} \right) \\
= 1. \]

Hence, we obtain
\[ p = (1 + a \alpha^* + b \beta^*) + \tau_0 e^{-ir_0} \left( b_{31} \bar{\beta} + b_{32} a \bar{\beta} + b_{13} \beta + b_{23} \bar{\beta} \right). \]  

Assume that \( x_0 \) is a solution of (33) with \( \mu = 0 \); we define
\[
z(t) = \langle q^*, x_0 \rangle, \\
W(t, \theta) = x_0 - 2 \text{Re}[z(t)q(\theta)].
\]

On \( C_0 \), one has
\[
\dot{z}(t) = \langle q^*, \dot{x}_0 \rangle = \langle q^*, A(\mu)x_0 + R(\mu)x_0 \rangle = \langle q^*, Ax_0 \rangle + \langle q^*, Rx_0 \rangle \\
= ir_0 w_0 z + \bar{q}_0 (0) \cdot f(0, W(t, 0) + 2 \text{Re}[z(t)q(0)]).
\]

Rewrite (39) as
\[
\dot{z}(t) = ir_0 w_0 z + g(z, \bar{z}),
\]
where
\[
W = \dot{x}_0 - \bar{q} = \begin{cases} \text{AW} - 2 \text{Re}[\bar{q}_0 (0) \cdot f(z, \bar{z})q(\theta)], & \theta \in [-\pi, 0), \\
\text{AW} - 2 \text{Re}[\bar{q}_0 (0) \cdot f(z, \bar{z})q(\theta)] + f_0(z, \bar{z}), & \theta = 0. \end{cases}
\]

Let
\[
W = AW + H(z, \bar{z}, \theta),
\]
where
\[ H(z, \bar{z}, \theta) = H_{20}(\theta) \frac{z^2}{2} + H_{11}(\theta) \frac{z \bar{z}}{2} + H_{02}(\theta) \frac{\bar{z}^2}{2} + \ldots \]

Following the method in [18–21], one obtains
\[
(A - 2i\omega_0)W_{20}(\theta) = -H_{20}(\theta), \\
AW_{11}(\theta) = -H_{11}(\theta), \\
(A + 2i\omega_0)W_{02}(\theta) = -H_{02}(\theta).
\]

Since \( x_1 = x(t + \theta) = W(z, \bar{z}, \theta) + zq + \bar{z} \cdot \bar{q}, \) one has
\[
W(t, \theta) = W(z, \bar{z}, t),
\]
where
\[
W(z, \bar{z}, t) = W_{20}(\theta) \frac{z^2}{2} + W_{11}(\theta) \frac{z \bar{z}}{2} + W_{02}(\theta) \frac{\bar{z}^2}{2} + \ldots
\]

In fact, \( z \) and \( \bar{z} \) are local coordinates for \( C_0 \) in \( q \) and \( q^* \).

As \( \mu = 0 \), we have
\[
\dot{z}(t) = ir_0 w_0 z + g(z, \bar{z}),
\]
where
\[
g(z, \bar{z}) = g_{20} \frac{z^2}{2} + g_{11} z \bar{z} + g_{02} \frac{\bar{z}^2}{2} + \ldots
\]

By (37) and (40), one has
\[
W(z, \bar{z}, \theta) = \begin{cases} W^{(1)}(z, \bar{z}, \theta), & \theta \in [-\pi, 0), \\
W^{(2)}(z, \bar{z}, \theta), & \theta = 0. \end{cases}
\]

Thus, one can obtain
\[
\varphi_1(0) = z + \bar{z} + W^{(1)}_{20}(0) \frac{z^2}{2} + W^{(1)}_{11}(0) z \bar{z} + W^{(1)}_{02}(0) \frac{\bar{z}^2}{2}, \\
\varphi_2(0) = zq_1 + \bar{z}q_1^* + W^{(1)}_{20}(0) \frac{z^2}{2} + W^{(1)}_{11}(0) z \bar{z} + W^{(1)}_{02}(0) \frac{\bar{z}^2}{2}.
\]

So,
\[ \varphi_1(0) \varphi_2(0) = q_1 z^2 + \overline{q}_1 \overline{z}^2 + (q_1 + q_2) z \overline{z} + \left( W^{(2)}_{11} + \frac{1}{2} W^{(2)}_{20} + W^{(1)}_{11} q_1 + \frac{1}{2} W^{(1)}_{20} q_2 \right) z^2 \overline{z}. \]  

(58)

By (27) and (43), one can obtain

\[
 f(\varphi, \mu) = \left( \begin{array}{c} K_{11} z^2 + K_{12} z \overline{z} + K_{13} \overline{z}^2 \\ K_{21} z^2 + K_{22} z \overline{z} + K_{23} \overline{z}^2 \\ K_{31} z^2 + K_{32} z \overline{z} + K_{33} \overline{z}^2 \end{array} \right),
\]

(59)

where

\[
 K_{11} = b_{14} + a b_{15} + b_{16} \beta^2 e^{-2iw_0 \tau_0},
\]

\[
 K_{12} = 2 b_{14} + b_{15} \alpha + b_{16} \overline{\beta} e^{-iw_0 \tau_0} + 2 \beta b_{16} + \overline{\beta} b_{17} e^{iw_0 \tau_0},
\]

\[
 K_{13} = b_{14} + \overline{a} b_{15} + b_{16} \overline{\beta} e^{2iw_0 \tau_0} + \overline{b}_1 \overline{\beta} e^{iw_0 \tau_0},
\]

\[
 K_{14} = 2 b_{14} W^{(1)}_{11}(0) + b_{15} W^{(2)}_{11}(0) + b_{16} W^{(1)}_{20}(0) + \frac{1}{2} b_{17} W^{(2)}_{20}(0) + b_{17} W^{(1)}_{11}(-1)
\]

\[
 + \frac{1}{2} b_{17} W^{(3)}_{20}(-1) + \beta^2 b_{18} e^{-2iw_0 \tau_0} + 2 \beta \overline{b}_{18} + b_{15} \alpha W^{(1)}_{11}(0) + b_{17} \beta W^{(1)}_{11}(0)
\]

\[
 + 2 \beta b_{16} e^{-iw_0 \tau_0} W^{(3)}_{11}(-1) + \frac{1}{2} \overline{b}_{17} W^{(1)}_{20}(0) e^{iw_0 \tau_0} + \overline{\beta} b_{16} W^{(3)}_{20}(-1) e^{iw_0 \tau_0},
\]

\[
 K_{21} = b_{25} \alpha^2 + 2 b_{27} \alpha \beta e^{-iw_0 \tau_0} + b_{24} \alpha + b_{26} \beta^2 e^{-2iw_0 \tau_0},
\]

\[
 K_{22} = 2 b_{25} \alpha \overline{\alpha} + 2 b_{27} \beta \overline{\beta} e^{iw_0 \tau_0} + b_{24} \alpha + b_{25} \overline{\alpha} e^{-iw_0 \tau_0} + b_{24} \overline{\alpha} + 2 b_{26} \beta \overline{\beta},
\]

\[
 K_{23} = b_{25} \overline{\alpha}^2 + 2 b_{27} e^{iw_0 \tau_0} \alpha \overline{\beta} + b_{24} \overline{\alpha} + b_{26} \beta^2 e^{2iw_0 \tau_0},
\]

\[
 K_{24} = 2 b_{28} \alpha \beta \overline{\beta} + 2 b_{29} \alpha W^{(2)}_{11}(0) + b_{30} \alpha W^{(3)}_{11}(-1) + b_{31} W^{(1)}_{11}(0) + b_{32} \overline{\alpha}^2 e^{-2iw_0 \tau_0}
\]

\[
 + b_{25} \overline{\alpha} W^{(2)}_{20}(0) + \frac{1}{2} b_{25} \overline{\alpha} W^{(3)}_{20}(-1) + \frac{1}{2} b_{24} \overline{\alpha} W^{(1)}_{20}(0) + 2 b_{26} e^{-iw_0 \tau_0} W^{(3)}_{11}(-1)
\]

\[
 + \frac{1}{2} b_{17} e^{iw_0 \tau_0} \overline{\beta} W^{(2)}_{20}(0) + b_{26} \overline{\beta} W^{(3)}_{20}(-1) e^{-iw_0 \tau_0} + b_{24} W^{(1)}_{11}(0) + \frac{1}{2} b_{24} W^{(2)}_{20}(0),
\]

\[
 K_{31} = b_{33} e^{-2iw_0 \tau_0} \alpha^2 + 2 b_{38} e^{-iw_0 \tau_0} \beta \alpha + b_{36} \beta^2 + b_{37} e^{-iw_0 \tau_0} \beta + b_{34} e^{-2iw_0 \tau_0},
\]

\[
 K_{32} = 2 b_{35} \alpha \overline{\alpha} + b_{36} \overline{\alpha} \overline{\beta} e^{iw_0 \tau_0} + b_{38} \overline{\alpha} \overline{\beta} e^{iw_0 \tau_0} + 2 b_{36} \overline{\beta} \overline{\beta} + b_{37} \beta e^{iw_0 \tau_0} + 2 b_{34},
\]

\[
 K_{33} = b_{35} \overline{\alpha}^2 + b_{36} \overline{\alpha} \overline{\beta} e^{iw_0 \tau_0} + b_{38} \overline{\alpha} \overline{\beta} e^{iw_0 \tau_0} + b_{36} \overline{\beta}^2 + b_{37} \overline{\beta} e^{iw_0 \tau_0} + b_{34} e^{2iw_0 \tau_0},
\]

\[
 K_{34} = b_{39} \alpha^2 \beta e^{-2iw_0 \tau_0} + 2 b_{30} \alpha \beta \overline{\beta} + b_{38} \alpha W^{(2)}_{11}(0) + 2 b_{35} e^{-iw_0 \tau_0} a W^{(2)}_{11}(-1)
\]

\[
 + b_{35} W^{(2)}_{11}(-1) e^{-iw_0 \tau_0} + 2 b_{36} \beta W^{(3)}_{11}(0) + b_{37} \beta W^{(1)}_{11}(0) + b_{38} W^{(2)}_{11}(0)
\]

\[
 + 2 b_{30} \beta + b_{39} \overline{\beta} e^{-2iw_0 \tau_0} + b_{37} W^{(1)}_{11}(0) e^{-iw_0 \tau_0} + \frac{1}{2} b_{37} W^{(3)}_{20} e^{iw_0 \tau_0}
\]

\[
 + 2 b_{34} W^{(1)}_{11}(-1) e^{-iw_0 \tau_0} + b_{34} W^{(3)}_{11}(0) e^{iw_0 \tau_0}.
\]
As \( q^* (0) = (1/\rho) (1, \theta_1, \theta_2)^\top \), one has

\[
g (z, \bar{z}) = \frac{1}{\rho} \left( 1, \theta_1, \theta_2 \right) \begin{pmatrix} K_{11} z^2 + K_{12} z \bar{z} + K_{13} \bar{z}^2 \\ K_{21} z^2 + K_{22} z \bar{z} + K_{23} \bar{z}^2 \\ K_{31} z^2 + K_{32} z \bar{z} + K_{33} \bar{z}^2 \end{pmatrix}
\]

(61)

Then, we have

\[
g_{20} = \frac{2}{\rho} (K_{11} + \bar{\alpha}^* K_{21} + \bar{\beta}^* K_{31}),
\]

\[
g_{11} = \frac{1}{\rho} (K_{12} + \bar{\alpha}^* K_{22} + \bar{\beta}^* K_{32}),
\]

(62)

\[
g_{02} = \frac{2}{\rho} (K_{13} + \bar{\alpha}^* K_{23} + \bar{\beta}^* K_{33}).
\]

Comparing the coefficients of (63), one has

\[
H_{20} (\theta) = -g_{20} q (\theta) - \bar{g}_{02} \bar{q} (\theta), \quad \theta \in [-1, 0),
\]

(64)

\[
H_{11} (\theta) = -g_{11} q (\theta) - \bar{g}_{11} \bar{q} (\theta), \quad \theta \in [-1, 0).
\]

(65)

Substituting (64) and (65) into (55), one can obtain

\[
\begin{cases}
W_{20} (\theta) = 2i \tau_0 \omega_0 W_{20} (\theta) + g_{20} q (\theta) + \bar{g}_{20} \bar{q} (\theta), \\
W_{11} (\theta) = + g_{11} q (\theta) + \bar{g}_{11} \bar{q} (\theta).
\end{cases}
\]

(66)

So,

\[
W_{20} (\theta) = \frac{i g_{20}}{\tau_0 \omega_0} q (0) e^{i \tau_0 \omega_0 \theta} - \frac{\bar{g}_{02}}{3 \tau_0 \omega_0} \bar{q} (0) e^{- i \tau_0 \omega_0 \theta} + E_1 e^{2 i \tau_0 \omega_0 \theta},
\]

\[
W_{11} (\theta) = \frac{g_{11}}{i \tau_0 \omega_0} q (0) e^{i \tau_0 \omega_0 \theta} - \frac{\bar{g}_{11}}{i \tau_0 \omega_0} \bar{q} (0) e^{- i \tau_0 \omega_0 \theta} + E_2.
\]

(67)

Now, we compute \( E_1 \) and \( E_2 \). From the definition of \( A \) in (31), one can obtain

\[
\int_{-1}^{0} d\eta (\theta) W_{20} (\theta) = 2i \tau_0 \omega_0 W_{20} (0) - H_{20} (0),
\]

(68)

\[
\int_{-1}^{0} d\eta (\theta) W_{11} (\theta) = -H_{11} (0).
\]

(69)

From (50), (68), and (69), we have

\[
H_{20} (\theta) = -g_{20} q (\theta) - \bar{g}_{02} \bar{q} (\theta) + (K_{11}, K_{21}, 0)^\top,
\]

\[
H_{11} (\theta) = -g_{11} q (\theta) - \bar{g}_{11} \bar{q} (\theta) + (K_{12}, K_{22}, 0)^\top.
\]

(70)

Following the method in [18–21], we have

\[
\text{Next, we compute } W_{20} (\theta) \text{ and } W_{11} (\theta). \text{ According to the expression of } g_{21}, \text{ we have } H (z, \bar{z}, \theta) = -2 \text{Re} [q^* (0) \cdot f (z, \bar{z}) q (\theta)].
\]

\[
= \left( g_{20} g_{21} z \bar{z} + g_{02} g_{21} \bar{z}^2 + \ldots \right) q (\theta) - \left( g_{11} g_{21} z \bar{z} + g_{02} g_{21} \bar{z}^2 + \ldots \right) q (\theta),
\]

(63)

\[
\begin{pmatrix} i \omega_0 I - \int_{-1}^{0} e^{i \omega_0 \theta} d\eta (\theta) \end{pmatrix} q (0) = 0
\]

(71)

\[
\begin{pmatrix} -i \omega_0 I - \int_{-1}^{0} e^{-i \omega_0 \theta} d\eta (\theta) \end{pmatrix} \bar{q} (0) = 0.
\]

Then, we can obtain

\[
\left( 2i \omega_0 I - \int_{-1}^{0} e^{2 i \tau_0 \omega_0 \theta} d\eta (\theta) \right) E_1 = \begin{pmatrix} K_{11} & K_{21} & 0 \end{pmatrix}^\top,
\]

(72)

which leads to

\[
\begin{pmatrix} 2i \omega_0 + b_{11} & b_{12} & b_{13} e^{-i \omega_0 T} \\
 b_{21} & 2i \omega_0 + b_{22} & b_{23} e^{-i \omega_0 T} \\
b_{31} & b_{32} & b_{33} \end{pmatrix} E_1 = \begin{pmatrix} K_{11} \\
 K_{21} \\
 K_{31} \end{pmatrix},
\]

(73)

and

\[
\begin{pmatrix} -b_{11} & -b_{12} & -b_{13} \\
 -b_{21} & -b_{22} & -b_{23} \\
b_{31} & b_{32} & b_{33} \end{pmatrix} E_2 = \begin{pmatrix} K_{12} \\
 K_{22} \\
 K_{32} \end{pmatrix}.
\]

(74)

Then, by (72) and (74), we can obtain the following properties of Hopf bifurcation:

\[
\mu_2 = \frac{\text{Re} C_1 (0)}{\text{Re} \lambda (\tau_0)},
\]

\[
T_2 = \frac{\text{Im} C_1 (0) + \mu_2 \text{Im} \lambda' (0)}{\omega_0},
\]

\[
\beta_2 = -2 \text{Re} C_1 (0).
\]

(75)
\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure2.png}
\caption{$\tau = 4.05 < \tau_0$. The positive equilibrium of system (3) is asymptotically stable.}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure3.png}
\caption{$\tau = 4.25 > \tau_0$. The bifurcation periodic solution is stable.}
\end{figure}
Theorem 3. From (75), one has

1. The directions of the Hopf bifurcation are determined by $\text{sign} (\mu_2)$: if $\mu_2 > 0 (\mu_2 < 0)$, then the Hopf bifurcation is forward (backward) and the bifurcating periodic solutions exist for $\tau > \tau_0 (\tau < \tau_0)$.

2. The stability of the bifurcating periodic solutions is determined by $\text{sign} (\beta_2)$: the bifurcating periodic solutions are stable (unstable) if $\beta_2 < 0 (\beta_2 > 0)$.

3. The period of the bifurcating periodic solutions is determined by $\text{sign} (T_2)$: the period increases (decreases) if $T_2 > 0 (T_2 < 0)$.

5. Numerical Examples

In this section, a numerical example is presented to support our obtained results. Consider system (3) with the following parameters: $r_1 = r_2 = r_3 = 1$, $c_1 = 0.05$, $c_2 = 0.081$, $d_1 = d_2 = d = 0.01$, $a_1 = 0.2$, $a_2 = 0.3$, $a_3 = 0.4$, $b_1 = 0.1$, and $b_2 = 0.1$. The positive equilibrium of (3) is $(1.8155, 0.9077, 3.3149)$. By (17), we can obtain $\tau_0 = 4.15$.

First, we choose $\tau = 4.1 < \tau_0$, and the outputs of three enterprises are shown in Figure 2. It is easy to see that output of enterprise is asymptotically stable.

Finally, we choose $\tau = 4.25 > \tau_0$, and the outputs of three enterprises are shown in Figure 3; it is easy to see that the output of the enterprise displays a periodic fluctuation.

6. Economic Meaning

In this paper, a novel competition-cooperation enterprise cluster model with core-satellite structure is proposed. The boundedness of the positive equilibrium is investigated. It is found that there exists upper bound of both core enterprise output and satellite enterprise output and the upper bound of core enterprise not only depends on its own production capacity but also depends on the production capacity of two satellite enterprises. Moreover, it is found that the production period plays a key role on the evolution of enterprise cluster. From simulation, we can obtain that the critical value of the production period is $\tau_0 = 4.15$. When the production period passes $\tau_0 = 4.15$, the output of the enterprise cluster system loses its stability and displays a periodic fluctuation, which means too long production cycle will lead to capacity fluctuations. From the viewpoint of enterprise management, output fluctuation may affect the stable development of enterprises, worker employment, and production efficiency. Thus, it is important for enterprise cluster to control the production period in a suitable region.
