Volume 79, no. 20, p. 12871–12879, 2005. Pages 12873 and 12874: We have recently recognized errors in Table 1 and Fig. 2.

Page 12873, Table 1, immunization and challenge schedule: In groups 1, 2 and 3, rBCG was primed at week 3, followed by booster immunization of rDIs at weeks 50 and 54. In groups 4 and 5, rDIs was primed at weeks 0 and 12, followed by booster immunization of rBCG at week 50. Then all animals were challenged with virulent SHIV KS661c at week 57.

Page 12874, Fig. 2: The weeks after immunization shown on the x axis in panel A should read “3, 7, 11, 19, 27, 35, 50, 53, 54, and 56.” The weeks after immunization shown on the x axis in panel B should read “0, 4, 8, 16, 24, 32, 50, 52, 53, 54, and 56.” Although the patterns and magnitudes of the kinetics were almost the same as the original ones, the standard deviation of the ELISPOT data at the peak response at 54 weeks after immunization was 500, which was five times more than originally reported. Spot-forming cells were counted by using a KS ELISPOT system after 35 weeks of immunization. Before that, we counted SFCs using an inverted microscope.

Page 12878, Acknowledgments, paragraph 1: Delete the last sentence of that paragraph.

These changes do not alter the conclusions of the article.
