ASKEY–WILSON INTEGRAL AND ITS GENERALIZATIONS

PAWEŁ J. SZABŁOWSKI

Abstract. We expand the Askey–Wilson (AW) density in a series of products of continuous \( q \)-Hermite polynomials times the density that makes these polynomials orthogonal. As a by-product we obtain the value of the AW integral as well as the values of integrals of \( q \)-Hermite polynomial times the AW density (\( q \)-Hermite moments of AW density). Our approach uses nice, old formulae of Carlitz and is general enough to venture a generalization. We prove that it is possible and pave the way how to do it.

1. Introduction and Preliminaries

1.1. Introduction. We consider sequence of nonnegative, integrable functions:
\[ g_n : [-1, 1] \to \mathbb{R}^+ \]
defined by the formula:
\[ g_n \left( x \mid a^{(n)}(q) \right) = f_h (x | q) \prod_{j=1}^{n} \varphi_h (x | a_j, q) , \]
where \( a^{(n)} = (a_1, \ldots, a_n) \), functions \( f_h \) and \( \varphi_h \) defined by (1.16) and (1.14) denote in fact respectively the density of measure that makes the so called continuous \( q \)-Hermite polynomials orthogonal and the characteristic function of these polynomials calculated at points \( a_j, j = 1, \ldots, n \). Naturally functions \( g_n \) are symmetric with respect to vectors \( a^{(n)} \).

Our elementary but crucial for this paper observation is that examples of such functions are the densities of measures that make orthogonal respectively the so called continuous \( q \)-Hermite (\( q \)-Hermite, \( n = 0 \)), big \( q \)-Hermite (bqH, \( n = 1 \)), Al-Salam–Chihara (ASC, \( n = 2 \)), continuous dual Hahn (C2H, \( n = 3 \)), Askey–Wilson (AW, \( n = 4 \)) polynomials. This observation makes functions \( g_n \) important and what is more exciting allows possible generalization of both AW integral as well as AW polynomials, i.e. go beyond \( n = 4 \).

Similar observations were in fact made in [10] when commenting on formula 10.11.19. Hence one can say that we are developing certain idea of [10].

On the other hand by the observation that these functions are symmetric in variables \( a^{(n)} \) we enter the fascinating world of symmetric functions.

The paper is organized as follows. Next Subsection 1.2 presents used notation and basic families of orthogonal polynomials that will appear in the sequel. We also present here important properties of these polynomials.

Date: December 20, 2011.

Key words and phrases. Askey–Wilson integral, Askey–Wilson polynomials, \( q \)-Hermite polynomials, expansion of ratio of densities, symmetric functions.
Section 2 is devoted to expanding functions \( g_n \) in the series of the form:

\[
g_n(x|a^{(n)}, q) = A_n \left( a^{(n)}, q \right) f_k(x|q) \sum_{j \geq 0} \frac{T_j^{(n)}(a^{(n)}, q)}{(q)_j} h_j(x|q),
\]

where \( \{ h_n \} \) denote \( q \)-Hermite polynomials, \( \{ T_j^{(n)} \} \) are sequences of certain symmetric functions and finally \( \{ A_n \} \) are the values of the integrals

\[
\int_{-1}^{1} g_n(x|a^{(n)}, q) \, dx,
\]

and symbol \( (q)_j \) is explained at the beginning of next Subsection.

We do this effectively for \( n = 0, \ldots, 4 \), obtaining known results in a new way. In Section 3 we show that defined above sequences do exist and present the way how to obtain them recursively. We are unable however to present nice compact forms of these sequences resembling those obtained for \( n \leq 4 \), thus posing several open questions (see Subsection 3.2) and leaving the field to younger and more talented researchers.

The partially legible although not very compact form was obtained for \( \int_{-1}^{1} g_5(x|a^{(5)}, q) \, dx \) (see (3.3)).

For \( q = 0 \), the case important for the rapidly developing so called ‘free probability’, we give simple, compact form for \( \int_{-1}^{1} g_5(x|a^{(5)}, 0) \, dx \) (see Theorem 2 ii)) paving the way to conjecture the compact form of (3.3).

Tedious, uninteresting proofs are shifted to Section 4.

1.2. Preliminaries. \( q \) is a parameter. We will assume that \(-1 < q \leq 1\) unless otherwise stated. Let us define \([0]_q = 0\), \([n]_q = 1 + q + \ldots + q^{n-1}\), \([n]_q! = \prod_{j=1}^{n} [j]_q\), with \([0]_q! = 1\) and

\[
\frac{[n]_q}{[k]_q} = \begin{cases} \frac{[n]_q!}{[n-k]_q! [k]_q!}, & n \geq k \geq 0 \\ 0, & \text{otherwise} \end{cases}
\]

We will use the so called \( q \)-Pochhammer symbol for \( n \geq 1 \):

\[
(a; q)_n = \prod_{j=0}^{n-1} (1 - aq^j),
\]

\[
(a_1, a_2, \ldots, a_k; q)_n = \prod_{j=1}^{k} (a_j; q)_n,
\]

with \((a; q)_n = 1\).

Often \((a; q)_n\) as well as \((a_1, a_2, \ldots, a_k; q)_n\) will be abbreviated to \(a)_n\) and \((a_1, a_2, \ldots, a_k)_n\), if it will not cause misunderstanding.

It is easy to notice that \((q)_n = (1 - q)^n [n]_q!\) and that

\[
\frac{[n]}{[k]}_q = \begin{cases} \frac{(a)_n}{(a)_n-k (q)_k}, & n \geq k \geq 0 \\ 0, & \text{otherwise} \end{cases}
\]
Remark 1. Notice that \([n]_1 = n, [n]_1! = n!, [n]_k = \binom{n}{k}, (a; 1)_n = (1 - a)^n\)
and \([n]_0 = \begin{cases} 1 & \text{if } n \geq 1 \\ 0 & \text{if } n = 0 \end{cases}, [n]_0! = 1, \binom{n}{k}_0 = 1\)
for \(0 \leq k \leq n\), \((a; 0)_n = a\) if \(n \geq 0\) and \((a; 0)_n = 0\) if \(n \geq 1\).

We will need the following sets of orthogonal polynomials

The Rogers–Szegő polynomials that are defined by the equality:

\[
w_n (x|q) = \sum_{k=0}^{n} \binom{n}{k}_q x^k,
\]

for \(n \geq 0\) and \(w_{-1} (x|q) = 0\). They will be playing an auxiliary rôle in the sequel.

In particular one shows (see e.g. [8]) that the polynomials defined by:

\[
h_n (x|q) = e^{i\sigma \theta} w_n (e^{-2\sigma \theta}|q)
\]

where \(x = \cos \theta\), satisfy the following 3-term recurrence:

\[
h_{n+1}(x|q) = 2x h_n(x|q) - (1 - q^n) h_{n-1}(x|q),
\]

with \(h_{-1}(x|q) = 0\), \(h_0(x|q) = 1\).

These polynomials are called continuous \(q\)-Hermite polynomials. A lot is known about their properties. For good reference see [8]. In particular we know that

\[
\sup_{|x| \leq 1} |h_n (x|q)| \leq w_n (1|q).
\]

Remark 2. Notice that \(h_n (x|0)\) equals to \(n - th\ Chebyshev polynomial of the second kind. More about these polynomials one can find in e.g. [10]. To analyze the case \(q = 1\) let us consider rescaled polynomials \(h_n\) i.e. \(H_n (x|q) = h_n (x\sqrt{1 - q^2}|q) / (1 - q^n)^{n/2}\). Then equation (1.4) takes a form:

\[
H_{n+1} (x|q) = x H_n (x|q) - [n]_q H_{n-1} (x|q),
\]

which shows that \(H_n (x|q) = h_n (x)\), where \(\{H_n\}\) denote the so called ‘probabilistic’ Hermite polynomials i.e. polynomials orthogonal with respect to the measure with density equal to \exp (-x^2/2) / \sqrt{2\pi}. This observation suggests that although the case \(q = 1\) lies within our interest it requires special approach. In fact it will be solved completely in Section [8]. For now we will assume that \(|q| < 1\).

In the sequel the following identities discovered by Carlitz (see Exercise 12.3(b) and 12.3(c) of [8]), true for \(|q|, |t| < 1\) :

\[
\sum_{k=0}^{\infty} w_k (1|q) t^k / (q)_k = \frac{1}{(t)_\infty^2}, \sum_{k=0}^{\infty} w_k^2 (1|q) t^k / (q)_k = \frac{(t^2)_\infty}{(t)_\infty^4},
\]

will enable to show convergence of many series considered in the sequel.

We have also the following so called ‘linearization formula’ ([8], 13.1.25) which can be dated back in fact to Rogers and Carlitz (see [10], 10.11.10 with \(\beta = 0\) or [16] for Rogers–Szegő polynomials):

\[
h_n (x|q) h_m (x|q) = \sum_{j=0}^{\min(n, m)} \binom{m}{j}_q \binom{n}{j}_q (q)_j h_{n+m-2k} (x|q),
\]

that will be our basic tool.
We will use the following two formulae of Carlitz presented in [6], that concern properties of Rogers–Szegő polynomials. Let us define two sets of functions

\[ \zeta_n(x|a, q) = \sum_{m \geq 0} a^m \left( \frac{q}{q} \right)_m w_{n+m}(x|q), \]

\[ \lambda_{n,m}(x, y|a, q) = \sum_{k \geq 0} a^k w_{n+k}(x|q) w_{m+k}(y|q), \]

defined for \(|x|, |y| \leq 1, |a| < 1\) and \(n, m\) being nonnegative integers. Carlitz proved ([6], (3.2), after correcting an obvious misprint) that

\[ \zeta_n(x|a, q) = \zeta_0(x|a, q) \mu_n(x|a, q), \]

(1.7)

\[ \zeta_0(x|a, q) = \frac{1}{(a, ax)_\infty}, \]

(1.8)

where functions \(\mu_n\) are polynomials that are defined by:

\[ \mu_n(x|a, q) = \sum_{j=0}^{n} \left( \frac{n}{j} \right)_q (a)_j x^j, \]

(1.9)

and that ([6], (1.4), case \(m = 0\) also given in [8], Ex 12.3 (d))

\[ \lambda_{n,0}(x, y|a, q) = \sum_{j=0}^{n} \sum_{k=0}^{m} \left[ \frac{n}{k} \right]_{q} \left[ \frac{m}{j} \right]_{q} (ax)_j (ay)_k (xya^2)_{k+j} x^{m-j} y^{n-k}, \]

with

\[ \lambda_{0,0}(x, y|a, q) = \frac{(xya^2)_{\infty}}{(a, ax, ay, axy)_\infty}. \]

(1.10)

(1.11)

It is elementary to prove the following two properties of the polynomials \(\mu_n\), hence we present them without the proof.

**Proposition 1.**

\[ x^n \mu_n(x^{-1}|a, q) = \sum_{k=0}^{n} \left[ \frac{n}{k} \right]_q (-a)_j q^{(j+1)} w_{n-j}(x|q), \]

(1.12)

\[ w_n(x|q) = \sum_{k=0}^{n} \left[ \frac{n}{k} \right]_q a^k x^{n-k} \mu_{n-k}(x^{-1}|a, q). \]

(1.13)

To perform our calculations we will need also the following two functions.

The generating function of the \(q\)–Hermite polynomials that is given by the formula below (see [7], 3.26.11):

\[ \varphi_h(x|t, q) \overset{df}{=} \sum_{j=0}^{\infty} \frac{t^j}{(q)_j} h_j(x|q) = \frac{1}{\prod_{k=0}^{\infty} v(x|tq^k)}, \]

(1.14)

where \(v(x|t) = 1 - 2tx + t^2\). Notice that \(v(x|t) \geq 0\) for \(|x| \leq 1\) and that from (1.5) it follows that series in (1.3) converges for \(|t| < 1\). Notice also that from (1.5) it follows that:

\[ \sup_{|x| \leq 1} \varphi_h(x|t, q) = 1/((|t|)_\infty^2). \]

(1.15)
The density of the measure with respect to which polynomials \( h_n \) are orthogonal is given in e.g. [7], (3.26.2). Following it we have
\[
\int_{-1}^{1} h_n(x|q) h_m(x|q) f_h(x|q) \, dx = (q)_n \delta_{nm},
\]
where \( \delta_{mn} \) denotes Kronecker’s delta, and
\[
f_h(x|q) = \frac{2(q)_\infty \sqrt{1 - x^2 / \pi}}{\prod_{k=1}^\infty l(x|q^k)},
\]
where \( l(x|a) = (1 + a)^2 - 4ax^2 \).

**Remark 3.** We have
\[
f_h(x|0) = 2 \sqrt{1 - x^2 / \pi}, \; \varphi_h(x|a, 0) = 1/ (1 - 2ax + a^2)
\]
for \(|x|, |a| < 1\).

After proper rescaling and normalization similar to the one performed in Remark 2 the case \( q = 1 \) leads to:
\[
\exp(-x^2/2) / \sqrt{2\pi} \; \exp(ax - a^2/2),
\]
for \( x, a \in \mathbb{R} \), as respectively the density of orthogonalizing measure and the characteristic function. For details see [11] or [4].

### 2. Main Results

Since in our approach symmetric polynomials will appear let us introduce the following set of symmetric polynomials of \( k \) variables:
\[
S_n^{(k)}(a_1, \ldots, a_k; q) = \sum_{j_1, \ldots, j_{k-1} \geq 0 \atop j_1 + \cdots + j_{k-1} \leq n} \frac{(q)_n}{\prod_{m=0}^{k-1} (q)_{j_m}} a_1^{j_1} \cdots a_{k-1}^{j_{k-1}} a_k^{n-j_1-\cdots-j_{k-1}}.
\]

**Remark 4.** Notice that \( S_n^{(k)}(a_1, \ldots, a_k; 1) = \left( \sum_{j=1}^{k} a_j \right)^n \).

**Proof.** Obvious since
\[
\left| \frac{(q)_n}{\prod_{m=1}^{k} (q)_{j_m}} \right|_{q=1} = \frac{n!}{(n - \sum_{m=1}^{k-1} j_m) \prod_{m=1}^{k-1} j_m!}.
\]

**Proposition 2.** Let \( q \in (-1, 1) \) then i)
\[
\sum_{n \geq 0} \frac{t^n}{(q)_n} S_n^{(k)}(a_1, \ldots, a_k) = \frac{1}{\prod_{j=1}^{k} (a_it)_\infty},
\]
ii) for \(|t| < 1\) and \( \forall j = 1, \ldots, k \)
\[
S_n^{(k)}(a_1, \ldots, a_k) = \sum_{m=0}^{n} \binom{n}{m} \frac{t^n}{m!} S_m^{(j)}(a_1, \ldots, a_j) S_{n-m}^{(k-j)}(a_{j+1}, \ldots, a_k),
\]
If \( q = 1 \), then
\[
\sum_{n \geq 0} \frac{t^n}{n!} S_n^{(k)}(a_1, \ldots, a_k) = \exp \left( t \sum_{j=0}^{k} a_j \right).
\]
iii) \[
\left| S^{(k)}_n (a_1, \ldots, a_k | q) \right| \leq \left( \max_{1 \leq j \leq k} |a_j| \right)^n S^{(k)}_n (1, \ldots, 1 | q).
\]

Proof. i) Notice that\[
\sum_{n \geq 0} \frac{t^n}{(q)_n} S^{(k)}_n (a_1, \ldots, a_k | q) = \sum_{n \geq 0} \sum_{j_1, \ldots, j_{k-1} \geq 0} \frac{(t a_1)^{j_1} \cdots (t a_{k-1})^{j_{k-1}} (t a_k)^{n-j_1-\cdots-j_{k-1}}}{\prod_{m=0}^{k-1} (q)_{j_m} (q)_{n-j_1-\cdots-j_{k-1}}}.
\]

Secondly recall that \( \frac{1}{(a)_\infty} = \sum_{j \geq 0} \frac{a^j}{(q)_j} \). Now the assertion is easy. ii) follows either direct calculation or i) and the properties of characteristic functions. iii) We use \( [21] \).

Recall (i.e. [8] or [7]) that there exist sets of orthogonal polynomials forming a part of the so called 'AW scheme' that are orthogonal with respect to measures with densities mentioned below. Although our main interest is in providing simple proof of the so called AW integral we will list related densities for better exposition and for indicating the ways of possible generalization of AW integrals and polynomials.

So let us mention first the so called big \( q \)-Hermite polynomials \( \{ h_n (x|a, q) \} \) whose orthogonalizing measure has density for \( |a| < 1 \). This density has a form (see [7] (3.18.2)) which can be written with the help of functions \( f_h \) and \( \varphi_h \). Namely:

\[
\begin{align*}
(2.4) & \quad f_{bh} (x|a, q) = f_h (x|q) \varphi_h (x|a, q), \\
(2.5) & \quad \int_{-1}^1 h_n (x|a, q) h_m (x|a, q) f_{bh} (x|a, q) = (q)_n \delta_{mn}.
\end{align*}
\]

The form of polynomials \( h_n (x|a, q) \) and their relation to \( q \)-Hermite polynomials is not important for our considerations. It can be found e.g. in [7] (3.18.4) or in [13], (2.11, 2.12). So for the sake of completeness let us remark that from (2.4) it follows immediately that for \( |x| \leq 1, |a| < 1 \)

\[
f_{bh} (x|a, q) = f_h (x|q) \sum_{n \geq 0} \frac{a^n}{(q)_n} h_n (x|q).
\]

Here and below, where we will present similar expansions convergence is almost uniform since all these expansions are in fact the Fourier series and that the Rademacher–Menshov theorem can be applied following [16].

Let us notice immediately that following (2.4) we have:

\[
\int_{-1}^1 h_n (x|q) f_{bh} (x|a, q) \, dx = a^n.
\]

Secondly let us mention the so called Al-Salam–Chihara polynomials \( \{ Q_n (x|a, b, q) \} \) that are orthogonal with respect to the measure that for \( |a|, |b| < 1 \) has the density of the form (compare [7] (3.8.2))

\[
(2.6) \quad f_Q (x|a, b, q) = (ab)_\infty f_h (x|q) \varphi_h (x|a, q) \varphi_h (x|b, q).
\]

We have the following Lemma that illustrates our method as well as to will give a very simple proof of well known so called Poisson–Mehler formula as a corollary.
Lemma 1. For $|x| \leq 1$, $|a|, |b| < 1$ we have

$$f_Q (x|a, b, q) = f_h (x|q) \sum_{j=0}^{\infty} \frac{S^{(2)}_j (a, b)}{(q)_j} h_j (x|q) .$$

Proof. Following (2.6) and (1.14) we have:

$$f_Q (x|a, b, q) = (ab)_\infty f_h (x|q) \sum_{j, k \geq 0} \frac{a^j b^k}{(q)_j (q)_k} h_j (x|q) h_k (x|q) .$$

Now we use (1.6) and (1.1) and change the order of summation getting:

$$f_Q (x|a, b, q) = (ab)_\infty f_h (x|q) \sum_{m \geq 0} (ab)^m \sum_{j, k \geq m} \frac{a^{j-m}b^{k-m}}{(q)_m (q)_{j-m} (q)_{k-m}} h_{j+k-m} (x|q)$$

$$= (ab)_\infty f_h (x|q) \sum_{m \geq 0} (ab)^m \sum_{n, i \geq 0} \frac{a^n b^i}{(q)_i (q)_n} h_{n+i} (x|q)$$

$$= f_h (x|q) \sum_{s \geq 0} \frac{h_s (x|q)}{(q)_s} \sum_{n=0}^{\infty} \left[ \sum_{j=0}^{\infty} a^n b^s - n \right] .$$

□

As an immediate corollary of our result we have:

$$\int_{-1}^{1} h_n (x|q) f_Q (x|a, b, q) dx = S^{(2)}_n (a, b|q) .$$

Remark 5. Let $a = pe^{i\eta}$, $b = pe^{-i\eta}$ and denote $y = \cos \eta$. Then

i) $S^{(2)}_n (a, b|q) = \rho^n h_n (y|q) .$

ii) $v (x|a) v (x|b) = (1 - \rho^2)^2 - 4xy\rho (1 + \rho^2) + 4\rho^2 (x^2 + y^2)$

Proof. i) is an immediate consequence of (1.3). ii) We have $v (x|a) v (x|b) = (1 - 2\rho xe^{i\eta} + \rho^2 e^{2i\eta})(1 - 2\rho xe^{-i\eta} + \rho^2 e^{-2i\eta})$ □

As a slightly more complicated corollary implied by Lemma 1 we have the following famous Poisson–Mehler (PM) expansion formula:

Corollary 1. For $|x|, |y| < 1$, $|\rho| < 1$ we have

$$\prod_{k=0}^{\infty} \left( 1 - \rho^2 q^{2k} \right)^2 - 4xy\rho q^k (1 + \rho^2 q^{2k}) + 4\rho^2 q^{2k} (x^2 + y^2)$$

$$= \sum_{j \geq 0} \frac{\rho^j}{(q)_j} h_j (x|q) h_j (y|q) .$$

Proof. We take $a = pe^{i\eta}$, $b = pe^{-i\eta}$ and denote $y = \cos \eta$. Now we use (2.6) and Remark 6 i) to get left hand side multiplied by $f_h$. Then we apply Lemma 1 and Remark 6 ii) to get right hand side of our PM formula also multiplied by $f_h$. Finally we cancel out $f_h$ which is positive on $(-1, 1)$. □

Remark 6. The calculations we have performed while proving Lemma 1 are very much like those performed in [3] while proving of Theorem 13.1.6 concerning Poisson kernel (or Poisson–Mehler) formula. There exist may proofs of PM formula, see e.g. [1] or recently obtained very short in [3]. In fact the formula (2.8) can be
dated back to Carlitz who in [17] formulated it for Rogers–Szegő polynomials. The one presented above seems to be one of the shortest, was obtained as a by-product and as already mentioned is almost the same as the one presented in [8].

Notice that considering (2.7) with \(a = \rho e^{i\eta}, \ b = \rho e^{-i\eta}\) and \(y = \cos \eta\) leads in view of Remark 5 i) to

\[
\int_{-1}^{1} h_n(x|q) f_Q(x|a, b, q) \, dx = \rho^n h_n(y|q),
\]
a nice symmetric formula that appeared in [2] in probabilistic context. Its probabilistic interpretation was exploited further in [11].

Third in our sequence of families of polynomials that constitute AW scheme are the so-called continuous dual Hahn (C2H) polynomials. Again their relationship to other sets of polynomials is not important. From [7], (3.3.2) it follows that the density of measure that makes them orthogonal is given by the following formula.

\[
f_{\text{CH}}(x|a, b, c, q) = (ab, ac, bc) f_h(x|q) \phi_h(x|a, q) \phi_h(x|b, q) \phi_h(x|c, q).
\]

We have the following lemma.

**Lemma 2.**

\[
f_{\text{CH}}(x|a, b, c, q) = f_h(x|q) \sum_{n \geq 0} \sigma_n^{(3)}(a, b, c|q) h_n(x|q),
\]

where

\[
(2.9) \quad \sigma_n^{(3)}(a, b, c|q) = \sum_{j=0}^{n} \binom{n}{j} q^j (-abc)^j S_n^{(3)}(a, b, c|q).
\]

**Proof.** Is shifted to Section 4.

**Remark 7.** Notice that for \(|t| < 1\)

\[
\sum_{n \geq 0} \frac{t^n}{(q)_n} \sigma_n^{(3)}(a, c, b|q) = \frac{(abc)_\infty}{(at, bt, ct)_\infty}.
\]

**Proof.** Using (2.9) we have:

\[
\sum_{n \geq 0} \frac{t^n}{(q)_n} \sigma_n^{(3)}(a, c, b|q) = \sum_{n \geq 0} \frac{t^n}{(q)_n} \sum_{j=0}^{n} \binom{n}{j} q^j (-abc)^j S_n^{(3)}(a, b, c|q)
\]

\[
= \sum_{j=0}^{\infty} \frac{(-abc)^j}{(q)_j} \sum_{n \geq j} \frac{t^{n-j}}{(q)_n} S_n^{(3)}(a, b, c|q).
\]

Now it remains to change the index of summation in the second sum, use (2.2) and use the fact that \(\sum_{j=0}^{\infty} \frac{(-abc)^j}{(q)_j} q^{\frac{j}{2}} = (abc)_\infty\).

**Corollary 2.** For \(|a|, |b|, |c| < 1\):

\[
\int_{-1}^{1} h_n(x|q) f_{\text{CH}}(x|a, b, c, q) \, dx = \sigma_n^{(3)}(a, b, c|q).
\]

**Proof.** Elementary.
Fourth family of polynomials that constitute AW scheme are the celebrated Askey–Wilson polynomials. Again their form and relationship to other families of polynomials of AW scheme is not important for our considerations. Recently a relatively rich study of these relationships was done in [13] hence it may serve as the reference. We need only the form of AW density. It is given e.g. in [7], (3.1.2) and after necessary adaptation to our notation is presented below:

\[ f_{\text{AW}}(x|a,b,c,d,q) = \frac{(ab,ac,ad,be,bd,cd)}{(abcd)_{\infty}} f_h(x|a) \varphi_h(x|a,q) \varphi_h(x|b,q) \varphi_h(x|c,q) \varphi_h(x|d,q), \]

for \(|x| \leq 1, |a|, |b|, |c|, |d| < 1\). Our main result concerns this density and is the following:

**Theorem 1.** For \(|x| \leq 1, |a|, |b|, |c|, |d| < 1\):

\[ f_{\text{AW}}(x|a,b,c,d,q) = f_h(x|q) \sum_{n \geq 0} \sigma_n^{(4)}(a,b,c,d|q) \frac{(q)_{n}}{h_n(x|q)}, \]

where

\[ \sigma_n^{(4)}(a,b,c,d|q) = \sum_{j=0}^{n} \binom{n}{j} \frac{(bd)_j}{(abcd)_j} S^{(2)}_{n-j}(b,d|q) \sum_{k=0}^{j} \frac{k}{j} (cb)^k (ad)_{j-k} c^{j-k}, \]

are symmetric functions of \(a, b, c, d\).

**Proof.** is shifted to section [4] \(\square\)

As immediate corollaries we have the following fact.

**Corollary 3.** For \(\max(|a|,|b|,|c|,|d|) < 1\):

\[ \int_{-1}^{1} h_n(x) f_{\text{AW}}(x|a,b,c,d,q) \, dx = \sigma_n^{(4)}(a,b,c,d|q). \]

**Proof.** Follows directly from (2.10) \(\square\)

**Remark 8.** Notice that from (2.10) follows in fact the value of AW integral, since we see that \(\int_{-1}^{1} f_{\text{AW}}(x|a,b,c,d,q) = 1\) which means that the integral

\[ \frac{1}{2\pi} \int_{-1}^{1} \frac{1}{\sqrt{1-x^2}} \prod_{n \geq 0} ^{l(x|q^n)} v(x|aq^n) v(x|bq^n) v(x|cq^n) v(x|dq^n) \, dx \]

\[ = \frac{(abcd)_{\infty}}{(q,ab,ac,ad,be,bd,cd)_{\infty}}. \]

(2.13) is nothing else but the celebrated AW integral. Notice also that recently there appeared at least two papers [15], [14] where (2.13) was derived from much more advanced theorems.

**Remark 9.** Notice also that (2.12) allows calculation of all moments of AW density. This is so since one knows the form of polynomials \(h_n\). Moments of AW density were calculated by Corteel et al. in 2010 in [5] using combinatorial means. For complex \(a, b, c, d\) but forming conjugate pairs this formula was also obtained independently about the same time. Namely it was done in [4] where also an elegant expansion of \(\sigma_n^{(4)}(\rho_1 e^{i\eta}, \rho_1 e^{-i\eta}, \rho_2 e^{i\theta}, \rho_2 e^{-i\theta}|q)\) in terms of \(h_n(y|q)\) and \(h_n(z|q)\), where \(\cos \eta = y\) and \(\cos \theta = z\) was presented.
3. Generalization and open questions

3.1. Generalization. The presented above results allow the following generalization. The cases \(|q| < 1\) and \(q = 1\) will be treated separately. First let us consider \(|q| < 1\).

Let us denote \(a^{(k)} = (a_1, \ldots, a_k), k = 0, 1, \ldots\). We will assume that \(|x| \leq 1\) and that all parameters \(a_i\) have absolute values less that 1. Let us denote

\[
g_n (x|a^{(n)}, q) = f_h (x|q) \prod_{j=1}^{n} \varphi_h (x|a_i, q),
\]

where functions \(f_h\) and \(\varphi_h\) were defined by (1.16) and (1.14) respectively.

We have the following general result.

**Lemma 3.** For every \(n \geq 0\), there exist \(A_n (a^{(n)}, q)\) a symmetric function of \(a^{(n)}\) and a sequence of symmetric in \(a^{(n)}\) functions \(\{T_j^{(n)} (a^{(n)}, q)\}_{j \geq 0}\) such that for \(|a_k| < 1, k = 1, \ldots, n:\)

\[
(3.1) \quad g_n (x|a^{(n)}, q) = A_n (a^{(n)}, q) f_h (x|q) \sum_{j \geq 0} T_j^{(n)} (a^{(n)}, q) h_j (x|q).
\]

Moreover

\[
(3.2) \quad \sum_{j \geq 0} \left( T_j^{(n)} (a^{(n)}, q) \right)^2 < \infty.
\]

**Proof.** Let \(G = L_2 (-1, 1, \mathcal{F}, f_h)\) be the space of functions \(h : \mathbb{L} \rightarrow \mathbb{R}\) such that \(\int_{-1}^{1} h^2 (x) f_h (x|q) dx\). Notice that this space is spanned by the polynomials \(\{h_j (x|q)\}_{j \geq 0}\). Visibly, under our assumptions and by (1.15), \(\prod_{j=1}^{n} \varphi_h (x|a_i, q) \in G\).

Now notice that \(\{T_j^{(n)} (a^{(n)}, q)\}_{j \geq 0}\) are coefficients of the Fourier expansion of the function \(\prod_{j=1}^{n} \varphi_h (x|a_i, q)\) in \(G\) with respect to \(\{h_j (x|q)\}_{j \geq 0}\). Since

\[
\int_{-1}^{1} f_h (x|q) \sum_{j \geq 0} T_j^{(n)} (a^{(n)}, q) h_j (x|q) dx = 1,
\]

\(A_n (a^{(n)}, q)\) is the value of \(\int_{-1}^{1} g_n (x|a^{(n)}, q) dx\). (3.2) follow properties of the Fourier expansion more precise the Perseval’s identity. The fact that \(A_n\) and \(\{T_j^{(n)}\}_{j \geq 0}\) are symmetric follows the observations that \(\prod_{j=1}^{n} \varphi_h (x|a_i, q)\) is symmetric.  

Using formula (1.39) we can write \(g_n\) in the following way where \(h_j\) are \(q\)-Hermite polynomials defined by (1.14). Functions \(A_n (a^{(n)}, q)\) and \(\{T_j^{(n)} (a^{(n)}, q)\}_{j \geq 0}\) have the following interpretation:

\[
\int_{[-1,1]} h_j (x|q) g_n (x|a^{(n)}, q) dx = A_n (a^{(n)}, q) T_j^{(n)} (a^{(n)}, q),
\]

for \(n, j \geq 0\).

We have the following easy Proposition giving recursions that are satisfied by functions \(A_n\) and \(T_j^{(n)}\).
**Proposition 3.** Let us define new sequence of functions \( \{ H_s(\mathbf{a}^{(n)}, q) \} \), of \( n \) variables:

\[
\sum_{m \geq 0} \frac{a_n^m}{(q)_m} T_{n+m}^{(n-1)}(\mathbf{a}^{(n-1)}, q) = H_s^{(n)}(\mathbf{a}^{(n)}, q) \sum_{m \geq 0} \frac{a_n^m}{(q)_m} T_{n+m}^{(n-1)}(\mathbf{a}^{(n-1)}, q).
\]

Then

i) 

\[
A_n(\mathbf{a}^{(n)}, q) = A_{n-1}(\mathbf{a}^{(n-1)}, q) \sum_{m \geq 0} \frac{a_n^m}{(q)_m} T_{n+m}^{(n-1)}(\mathbf{a}^{(n-1)}, q),
\]

ii) 

\[
T_j^{(n)}(\mathbf{a}^{(n)}, q) = \sum_{s=0}^{j} \binom{j}{s} H_s^{(n-1)}(\mathbf{a}^{(n-1)}, q) (a_n)^{j-s}.
\]

**Proof.** Proof is shifted to section 2. \( \square \)

**Remark 10.** The integral \( \int_{-1}^{1} g_n(x|\mathbf{a}^{(n)}, q) \, dx \) has been calculated in [8] (see also theorem 15.3.1 in [8]) by combinatorial methods. Obtained formula is however very complicated. Besides above mentioned Theorem 15.3.1 of [8] does not provide expansion (3.3) which is automatically obtained in our approach.

**Remark 11.** Notice also that following Proposition 3 i) we get for \(|a_j| < 1, j = 1, \ldots, 5\):

\[
(3.3) \quad \int_{-1}^{1} g_5(x|\mathbf{a}^{(5)}, q) = \frac{\prod_{j} a_j}{(q)_{\infty} \prod_{1 \leq k < m \leq 4} (a_k a_m)} \sum_{j=0}^{5} \frac{a_5^j}{(q)_j} \sigma_{(4)}^{(j)}(a_1, a_2, a_3, a_4|q)
\]

For \( q = 0 \) the calculations presented in (3.3) can be carried out completely and the concise form can be obtained. This is possible due to the following simplified form of (2.11).

**Theorem 2.** Let \( \mathbf{a}^{(5)} \). Under \(|a_j| < 1, j = 1, \ldots, 5\) we have:

i) 

\[
\sigma_{n}^{(4)}(a_1, a_2, a_3, a_4|0) = S_{n}^{(2)}(a_2, a_4|0) + \frac{(1 - a_2 d)(1 - a_1 a_4)}{(1 - a_1 a_2 a_3 a_4)} a_3 S_{n-1}^{(3)}(a_2, a_3, a_4|0) + \frac{(1 - a_2 a_4)(1 - a_3 a_2)}{(1 - a_1 a_2 a_3 a_4)} a_1 S_{n-1}^{(3)}(a_1, a_2, a_4|0) + \frac{(1 - a_2 a_4)(1 - a_2 a_3)(1 - a_1 a_4) a_1 a_3}{(1 - a_1 a_2 a_3 a_4)} S_{n-2}^{(4)}(a_1, a_2, a_3, a_4|0),
\]

\[
i) \quad \int_{-1}^{1} g_5(x|\mathbf{a}^{(5)}, 0) \, dx = \frac{1 - \chi_4(\mathbf{a}^{(5)}) + \chi_5(\mathbf{a}^{(5)}) \chi_1(\mathbf{a}^{(5)}) - \chi_3^2(\mathbf{a}^{(5)})}{\prod_{1 \leq j < k \leq 5}(1 - a_j a_k)},
\]

where \( \chi_j(\mathbf{a}^{(k)}) \) denote respectively first five elementary symmetric functions of vector \( \mathbf{a}^{(5)} \). That is \( \chi_j(\mathbf{a}^{(k)}) = \sum_{1 \leq n_1 < n_2 \ldots < n_j \leq 5} \prod_{m=1}^{j} a_{n_m} \).

**Proof.** Is shifted to Section 3. \( \square \)

For \( q = 1 \) the problem of finding sequences \( A_n(\mathbf{a}^{(n)}|1) \) and \( \{ T_j^{(n)}(\mathbf{a}^{(n)}, 1) \}_{j \geq 0} \) can be solved completely and trivially. Namely we have:
Proposition 4.

\[
A_n \left( a^{(n)} | 1 \right) = \exp \left( \sum_{1 \leq j < k \leq n} a_j a_k \right),
\]

\[
T^{(n)}_j \left( a^{(n)}, 1 \right) = \left( \sum_{a_k}^n \right)^j.
\]

Proof. Using Remark 3 we get:

\[
g_n \left( x | a^{(n)}, 1 \right) = \exp \left( -x^2 / 2 + x \sum_{j=1}^n a_j - \frac{1}{2} \sum_{j=1}^n a_j^2 \right) / \sqrt{2\pi}
\]

\[
= \frac{1}{\sqrt{2\pi}} \exp \left( \frac{1}{2} \left( \left( \sum_{j=1}^n a_j \right)^2 - \left( \sum_{j=1}^n a_j^2 \right) \right) \right) \exp \left( -x^2 / 2 + x \sum_{j=1}^n a_j - \frac{1}{2} \left( \sum_{j=1}^n a_j \right)^2 \right)
\]

\[
= \exp \left( \sum_{1 \leq j < k \leq n} a_j a_k \right) \frac{\exp \left( -x^2 / 2 \right) \sum_{j \geq 0} \left( \sum_{a_k}^n \right)^j}{\sqrt{2\pi}} H_j \left( x \right).
\]

\[\square\]

3.2. Unsolved Problems & Open Questions.

3.2.1. Questions.

- What are the compact forms of functions \( \left\{ T^{(n)}_j \left( a^{(n)}, q \right) \right\}_{j \geq 0, n \geq 5} \) and \( \left\{ A_n \left( a^{(n)}, q \right) \right\}_{n \geq 5} \) ?

- What is the compact form of these functions for \( q = 0 \) (free probability case)?

- Following formula for \( \int_{-1}^1 g_5 \left( x | a^{(5)}, 0 \right) dx \) given in assertion ii) of Theorem 2 is it true that:

\[
\int_{-1}^1 g_5 \left( x | a^{(5)}, q \right) dx = \left( \chi_4 \left( a^{(5)} \right) - \chi_5 \left( a^{(5)} \right) \chi_1 \left( a^{(5)} \right) + \chi_5^2 \left( a^{(5)} \right) \right) \prod_{1 \leq j < k \leq 5} (a_j a_k) \infty\) ?
\]

Notice that for \( a_5 = 0 \) it would reduce to AW integral.

- It would be valuable to get values \( \left\{ A_n \left( a^{(n)}, q \right) \right\} \) for \( n = 8, 12 \) and so on for complex values of parameters \( a^{(n)} \) but forming conjugate pairs. It would be also fascinating to find polynomials that would be orthogonalized by so obtained densities.

This problem follows the probabilistic interpretation of Askey–Wilson density rescaled, with complex parameters. Such interpretation for finite Markov chains of length at least 3 was presented in [4], [13]. Let \( \{X_1, X_2, X_3\} \) denote this finite Markov chain. Then recall that then AW density can be interpreted as the conditional density of \( X_3 | X_1, X_2 \).

It would be exciting to find out if for say \( n = 8 \) similar probabilistic interpretation could be established. That is if we could have defined 5—dimensional random vector \( (X_1, \ldots, X_5) \) with normalized function \( g_8 \left( x | a^{(8)}, q \right) \) as the conditional density \( X_3 | X_1, X_2, X_4, X_5 \). Note that then the chain \( (X_1, \ldots, X_5) \) could not be Markov.
Similar questions apply to the case \( n = 12, 16, \ldots \).

3.2.2. Unsolved related problems and direction of further research. In [10] we find Theorem 10.8.2 which is due Gasper and Rahman (1990) and which can be stated in our notation. For \( \max_{1 \leq j \leq 5} |a_j| < 1, \ |q| < 1 \) we have:

\[
\int_{-1}^{1} g_5(x|a^{(5)}, q) \varphi_h(x|\prod_{j=1}^{5} a_j, q) \ dx = \frac{\prod_{k=1}^{5} (\prod_{l=1,k \neq j}^{5} a_k)_{\infty}}{\prod_{1 \leq j < k \leq 5} (a_j a_k)_{\infty}}.
\]

This result suggests considering the following functions

\[
G_{n,m}(x|a^{(n)}, b^{(m)}, q) = f_h(x|q) \prod_{j=1}^{n} \varphi_h(x|a_j, q) \prod_{k=1}^{m} \varphi_h(x|b_k, q),
\]

where \( a^{(n)} \) and \( b^{(m)} \) are certain vectors of dimensions respectively \( n \) and \( m \), find its integrals over \([-1, 1]\) and expansions similar to (3.1).

4. Proofs

**Proof of Lemma** We have

\[
\sum_{k,n,m \geq 0} \frac{a^n}{(q)_n (q)_m} \frac{b^m}{(q)_m} c^k \ h_n(x|q) h_m(x|q) h_k(x|q)
\]

\[
= \frac{1}{(ab)_{\infty}} \sum_{j \geq 0} h_j(x|q) \sum_{m=0}^{\infty} \sum_{k=0}^{j} \left( \begin{array}{c} j \\ k \end{array} \right)_q c^k S^{(2)}_{m+j-k}(a,b|q).
\]

Since obviously \( S^{(2)}_n(a,b|q) = a^n w_n(b/a|q) \) we get:

\[
\sum_{k,n,m \geq 0} \frac{a^n}{(q)_n (q)_m} \frac{b^m}{(q)_m} c^k \ h_n(x|q) h_m(x|q) h_k(x|q)
\]

\[
= \frac{1}{(ab)_{\infty}} \sum_{j \geq 0} h_j(x|q) \sum_{m=0}^{\infty} \sum_{k=0}^{j} \left( \begin{array}{c} j \\ k \end{array} \right)_q c^k a^{m+j-k} w_{m+j-k}(b/a|q)
\]

\[
= \frac{1}{(ab)_{\infty}} \sum_{j \geq 0} h_j(x|q) \sum_{k=0}^{j} \left( \begin{array}{c} j \\ k \end{array} \right)_q c^k a^{j-k} \sum_{m=0}^{\infty} \frac{a^m}{(q)_m} w_{m+j-k}(b/a|q).
\]

Now we apply formula (1.7) and get:

\[
\sum_{k,n,m \geq 0} \frac{a^n}{(q)_n (q)_m} \frac{b^m}{(q)_m} c^k \ h_n(x|q) h_m(x|q) h_k(x|q)
\]

\[
= \frac{1}{(ab, bc, ac)_{\infty}} \sum_{j \geq 0} h_j(x|q) \sum_{k=0}^{j} \left( \begin{array}{c} j \\ k \end{array} \right)_q c^k a^{j-k} \mu_{j-k}(b/a|ac, q) \frac{1}{(bc)_{\infty}} (bc)_{\infty}
\]

\[
= \frac{1}{(ab, bc, ac)_{\infty}} \sum_{j \geq 0} h_j(x|q) \sum_{l=0}^{j} \left( \begin{array}{c} n \\ l \end{array} \right)_q c^{n-l} a^{l} \left( \frac{b}{a} \right)^j \left( \frac{a}{\alpha} \right) \mu_{j} \left( \frac{a}{\alpha} \right)^{-1} |ac, q|.
\]
Now we use (1.12) and Proposition 2 ii) and get:

\[
\sum_{k,n,m,l,j \geq 0} \frac{a^n}{(q)_n} \frac{b^m}{(q)_m} \frac{c^k}{(q)_k} \frac{d^j}{(q)_j} h_n (x|q) h_m (x|q) h_k (x|q) h_j (x|q)
\]

\[
= \frac{1}{(ab, bc, ac) \infty} \sum_{j \geq 0} \frac{h_j (x|q)}{(q)_j} \sum_{k=0}^l \frac{[j]}{[l]} \frac{1}{q^k} \sum_{k=0}^l \frac{[l]}{q^k} (ac)^k q^{(2)} w_{l-k} \left( \frac{a}{b} \right)
\]

\[
= \frac{1}{(ab, bc, ac) \infty} \sum_{j \geq 0} \frac{h_j (x|q)}{(q)_j} \sum_{k=0}^l \frac{[j]}{[l]} (-ac)^k q^{(2)} \sum_{j=0}^l \frac{[j]}{[l]} \sum_{m=0}^{j-k} \frac{[j]}{[m]} \frac{m}{q} (j-k-m b^{k+m} w_m (a/b|q))
\]

\[
= \frac{1}{(ab, bc, ac) \infty} \sum_{j \geq 0} \frac{h_j (x|q)}{(q)_j} \sum_{k=0}^l \frac{[j]}{[l]} (-abc)^k q^{(2)} \sum_{j=0}^l \frac{[j]}{[m]} \sum_{m=0}^{j-k} \frac{[j]}{[m]} \frac{m}{q} (j-k-m q^{(2)} (a/b|q)).
\]

\[
\square
\]

Proof of Theorem 7. We have

\[
\sum_{k,n,m,j \geq 0} \frac{a^n}{(q)_n} \frac{b^m}{(q)_m} \frac{c^k}{(q)_k} \frac{d^j}{(q)_j} h_n (x|q) h_m (x|q) h_k (x|q) h_j (x|q)
\]

\[
= \frac{1}{(ab, cd) \infty} \sum_{m,k \geq 0} \frac{s_m (a, b|q) s_k (c, d|q)}{(q)_m (q)_k} h_m (x|q) h_k (x|q)
\]

\[
= \frac{1}{(ab, cd) \infty} \sum_{m,k \geq 0} \frac{s_m (a, b|q) s_k (c, d|q)}{(q)_m (q)_k} \sum_{j=0}^\infty \frac{[m]}{[j]} \frac{1}{q^j} \sum_{j=0}^\infty \frac{[k]}{[j]} \frac{1}{q^j} (j) h_{m+k-2j} (x|q)
\]

\[
= \frac{1}{(ab, cd) \infty} \sum_{j \geq 0} \frac{(ac)^j}{(q)_j} \sum_{m,k \geq j} \frac{a^{m-j} b^{k-j} s_m (b/a|q) w_m (d/c|q)}{(q)_m (q)_k} h_{m-j+k-j} (x|q)
\]

and further

\[
\sum_{k,n,m,j \geq 0} \frac{a^n}{(q)_n} \frac{b^m}{(q)_m} \frac{c^k}{(q)_k} \frac{d^j}{(q)_j} h_n (x|q) h_m (x|q) h_k (x|q) h_j (x|q)
\]

\[
= \frac{1}{(ab, cd) \infty} \sum_{j \geq 0} \frac{(ac)^j}{(q)_j} \sum_{s,t \geq 0} \frac{a^s b^{s+j} w_{s+j} (b/a|q) w_{t+j} (d/c|q)}{(q)_s (q)_t} h_{s+t} (x|q)
\]

\[
= \frac{1}{(ab, cd) \infty} \sum_{j \geq 0} \frac{(ac)^j}{(q)_j} \sum_{n \geq 0} \frac{h_n (x|q)}{(q)_n} \sum_{k=0}^n \frac{[n]}{[k]} \frac{1}{q^k} \sum_{j \geq 0} \frac{a^{k-n} b^{k+j} w_{k+j} (b/a|q) w_{j+n-k} (d/c|q)}{(q)_k (q)_j}
\]

\[
= \frac{1}{(ab, cd) \infty} \sum_{n \geq 0} \frac{h_n (x|q)}{(q)_n} \sum_{k=0}^n \frac{[n]}{[k]} \frac{1}{q^k} \sum_{j \geq 0} \frac{a^{k-n} b^{k+j} w_{k+j} (b/a|q) w_{j+n-k} (d/c|q)}{(q)_j}
\]
Now we apply Carlitz formulae (1.10) and (1.11) getting:

\[
\sum_{k,n,m,j\geq 0} \frac{a^n}{(q)_n} \frac{b^m}{(q)_m} \frac{c^k}{(q)_k} \frac{d^j}{(q)_j} h_2 (x|q) h_m (x|q) h_k (x|q) h_j (x|q) \\
= \frac{(abcd)_{\infty}}{(ab, cd, ac, b, ad, bd)} \sum_{n \geq 0} \frac{h_n (x|q)}{(q)_n} \sum_{k=0}^{n} \left[ \frac{n}{k} \right] a^k c^{n-k} \times \sum_{s=0}^{k} \sum_{t=0}^{n-k} \left[ \frac{k}{s} \right] \left[ \frac{n-k}{t} \right] \frac{(cb)_s (ad)_t (bd)_{s+t}}{(abcd)_{s+t}} \frac{(b)}{a} \frac{(d)}{c} k-s \times n-k-t \\
= \frac{(abcd)_{\infty}}{(ab, cd, ac, b, ad, bd)} \sum_{n \geq 0} \frac{h_n (x|q)}{(q)_n} \sum_{k=0}^{n} \left[ \frac{n}{k} \right] a^k c^{n-k} \times \sum_{s=0}^{k} \sum_{t=0}^{n-k} \left[ \frac{k}{s} \right] \left[ \frac{n-k}{t} \right] \frac{(cb)_s (ad)_t (bd)_{s+t}}{(abcd)_{s+t}} a^s b^k c^t d^{n-k-t}.
\]

Thus it remains to show that for every \( n \geq 0 \):

\[
\sum_{k=0}^{n} \left[ \frac{n}{k} \right] \sum_{s=0}^{k} \sum_{t=0}^{n-k} \left[ \frac{k}{s} \right] \left[ \frac{n-k}{t} \right] \frac{(cb)_s (ad)_t (bd)_{s+t}}{(abcd)_{s+t}} a^s b^k c^t d^{n-k-t} = \sum_{j=0}^{n} \frac{(bd)_j}{(abcd)_{2j+1}} S_{n-j}^{(2)} (b, d|q) \frac{j}{k} \left[ \frac{j}{k} \right] \frac{(cb)_k a^k (ad)_{j-k}}{a_j c^{j-k}}.
\]

This fact follows the following calculations:

\[
\sum_{k=0}^{n} \left[ \frac{n}{k} \right] \sum_{s=0}^{k} \sum_{t=0}^{n-k} \left[ \frac{k}{s} \right] \left[ \frac{n-k}{t} \right] \frac{(cb)_s (ad)_t (bd)_{s+t}}{(abcd)_{s+t}} a^s b^k c^t d^{n-k-t} = \sum_{s,t \geq 0, s+t \leq n} \frac{(q)_t}{(abcd)_{s+t}} b^{n-s-t} d^{n-k-t} \\
= \sum_{s,t \geq 0, s+t \leq n} \frac{(q)_t}{(abcd)_{s+t}} (cb)_s (ad)_t (bd)_{s+t} a^s c^t d^{n-k-t} \\
= \sum_{s,t \geq 0, s+t \leq n} \frac{(q)_t}{(abcd)_{s+t}} (cb)_s (ad)_t (bd)_{s+t} a^s c^t S_{n-s-t}^{(2)} (b, d|q) \\
= \sum_{s,t \geq 0, s+t \leq n} \frac{(q)_t}{(abcd)_{s+t}} (cb)_s (ad)_t (bd)_{s+t} a^s c^t S_{n-t-s}^{(2)} (b, d|q).
\]

Now we introduce new indices of summation: \( j = t + s, k = s \). We have then

\[
\sum_{s,t \geq 0, s+t \leq n} \frac{(q)_t}{(abcd)_{s+t}} (cb)_s (ad)_t (bd)_{s+t} a^s c^t S_{n-t-s}^{(2)} (b, d|q) = \sum_{j=0}^{n} \frac{(bd)_j}{(abcd)_{2j+1}} S_{n-j}^{(2)} (b, d|q) \frac{j}{k} \left[ \frac{j}{k} \right] \frac{(cb)_k a^k (ad)_{j-k}}{a_j c^{j-k}}.
\]

\[\square\]

**Proof of Proposition** Notice that for \( n = 0 \) our formulae are true since we have:

\[
g_1 (x|a_1, q) = f_h (x|q) \varphi_h (x|a_1, q) = f_h (x|q) \sum_{m=0}^{\infty} \frac{a^m}{(q)_m} h_m (x|q), \text{ So } T_m^{(1)} (a_1, q) =
\]
$a_1^m$ and $A_1(a_1, q) = 1$. Next notice that:

$$g_{n+1}(x | a^{(n+1)}, q) = g_n(x | a^{(n)}, q) \varphi_h(x | a_{n+1}, q),$$

where we understand $a^{(n+1)} = (a_1, \ldots, a_n, a_{n+1})$. So by induction assumption the left hand side of (3.1) is equal to:

$$A_{n+1}(a^{(n+1)}, q) f_h(x | q) \sum_{j \geq 0} \frac{T_j^{(n+1)}(a^{(n+1)}, q)}{(q)_j} h_j(x | q),$$

while the right hand side to

$$A_n(a^n, q) f_h(x | q) \sum_{j,k \geq 0} \frac{T_j^{(n)}(a^n, q) a_k^{n+1}}{(q)_j (q)_k} h_j(x | q) h_k(x | q).$$

We apply again (1.6) getting:

$$\sum_{j,k \geq 0} \frac{T_j^{(n)}(a^n, q) a_k^{n+1}}{(q)_j (q)_k} h_j(x | q) h_k(x | q) = \sum_{j,k \geq 0} \frac{T_j^{(n)}(a^n, q) a_k^{n+1}}{(q)_j (q)_k} \sum_{m \geq 0} h_{j+m-2m}(x | q) h_{j+k-2m}(x | q)$$

$$= \sum_{m \geq 0} a_{m+1}^{n+1} \sum_{k,j \geq m} \frac{a^{n+1}_{m+k} T_j^{(n)}(a^n, q)}{(q)_j (q)_k} h_{j+k-2m}(x | q)$$

$$= \sum_{m \geq 0} a_{m+1}^{n+1} \sum_{s,t \geq 0} \frac{a_s^{n+1} T_{m+r}(a^n, q)}{(q)_s (q)_t} h_{s+t}(x | q).$$

Next we introduce new indices of summation $r = s + t$ and $j = s$ and get:

$$\sum_{j,k \geq 0} \frac{T_j^{(n)}(a^n, q) a_k^{n+1}}{(q)_j (q)_k} h_j(x | q) h_k(x | q) = \sum_{m \geq 0} a_{m+1}^{n+1} \sum_{r=0}^{\infty} h_r(x | q) \sum_{j=0}^{r} a_j^{n+1} T_{m+r-j}(a^n, q)$$

$$= \sum_{m \geq 0} a_{m+1}^{n+1} T_m(a^n, q) \sum_{r=0}^{\infty} h_r(x | q) \sum_{j=0}^{r} a_j^{n+1} H_{m+r-j}(a^n, q)$$

$$= \frac{A_n(a^{(n+1)}, q)}{A_n(a^n, q)} \sum_{r=0}^{\infty} h_r(x | q) \sum_{j=0}^{r} a_j^{n+1} H_{r-j}(a^n, q).$$

\[\square\]

**Proof of Theorem 2.** We use (2.11) and utilizing Remark 1 we get:

$$a_1^{(4)}(a, b, c, d | 0) = S_1^{(2)}(b, d | 0) + \frac{(1 - bd)}{(1 - abcd)} \sum_{j=1}^{n} S_j^{(2)}(a, d | 0) \sum_{j=0}^{r} a_j^{n+1} H_{r+j}(a^n, q)$$

$$= (1 - cb)a^j + (1 - cb)(1 - ad)c^j \sum_{j=0}^{r} a_j^{n+1} H_{r+j}(a^n, q).$$
And further
\[
\sigma_n^{(4)}(a, b, c, d|0) = S_n^{(2)}(b, d|0) + \frac{(1 - bd)}{(1 - abcd)} \sum_{j=1}^{n} S_{n-j}^{(2)}(b, d|q) ((1 - ad)c^j + (1 - cb)a^j + (1 - cb)(1 - ad)c^j a^j + (1 - bd)(1 - cb)(1 - ad)ac S_{n-j}^{(2)}(a, c|0)
\]

Now we use formula (2.3). Then we replace \(a\) by \(a_1\), \(b\) by \(a_2\) and so on. Finally we use formulae (3.3) and (2.2) which remembering that \((0)_n = 1\) leads to our integral formula.

\[\square\]
