The present research paper is related to the analytical studies of \( p \)-Laplacian heat equations with respect to logarithmic nonlinearity in the source terms, where by using an efficient technique and according to some sufficient conditions, we get the global existence and decay estimates of solutions.

1. A Brief History and Contribution

Consider the following nonlinear \( p \)-Laplacian problem:

\[
\begin{align*}
\frac{\partial u}{\partial t} - \text{div} \left( |\nabla u|^{p-2} \nabla u \right) + |u|^{p-2} u &= |u|^{p-2} u \ln |u|, \quad x \in \Omega, \quad t > 0, \\
u(x, 0) &= u_0(x), \quad x \in \Omega, \\
u(x, t) &= 0, \quad x \in \partial \Omega, \quad t \geq 0,
\end{align*}
\]

where \( \Omega \subset \mathbb{R}^n \) is a bounded domain with smooth boundary \( \partial \Omega \), the function \( u_0 \) is given initial data and exponent \( p \) verify

\[
\begin{align*}
2 &< p < \infty, \quad \text{if } n \leq p, \\
2 &< p < \frac{np}{n-p}, \quad \text{if } n > p.
\end{align*}
\]

In the last few decades, the researchers have shown significant interest in polynomial nonlinear terms in different areas, such as edge detection, viscoelasticity, engineering, electromagnetic, electrochemistry, cosmology, signal processing material science, turbulence, diffusion, physics, and acoustics. Many other problems in applied sciences are also modeled by linear and nonlinear evolutionary partial differential equations [1–13]. Various dynamical systems in physics and engineering are also modeled by using evolutionary differential equations. Many researchers have contributed a lot to provide an outstanding history of the evolutionary differential partial equations related to \( p(x) \)-Laplacian such as [13–17].

The majority of problems in science are nonlinear, and it is not easy to find its analytical solutions. The physical problems are mostly designed by using higher nonlinear partial differential equations (PDEs). It is found to be very difficult to find the exact or analytical solutions for such problems.
However, in the last several centuries, many scientists have made significant progress and adopted different techniques to study the analytical side of the nonlinear PDEs. Through recent years and in the literature on nonlinear PDEs, logarithmic nonlinearity has received much interest from mathematicians and physicists. If we read in recent research, we notice that logarithmic nonlinearity has been entered into nonrelativistic wave equations that describe spinning particles that move in an external electromagnetic field and in the relativistic wave equation for spinless particles (see, for example, [2, 4, 18, 19]). In addition to what we mentioned above, this type of nonlinearity is used in various branches of physics such as optics, nuclear physics, geophysics, and inflationary cosmology (to read about this in detail, see [18–31]). Given all the basic previous meanings in physics, the study of universal solutions of this type of nonlinear logarithms is of great interest on the part of mathematicians.

Recently, Wu and Xue in [32] gave the uniformly proof of energy decay of the solution using the multiplier method of the following problem:

\[ u_{tt} - \div (|\nabla u|^{p-2}\nabla u) - \Delta u_t + |u|^{p-1}u_t = |u|^{p-1}u. \]  

Moreover, the author in [33] studied the exponential and polynomial decay rate of solutions for seminar problem (3) by applying the inequality of Nakao.

On the other hand, for a Laplacian parabolic equation related to the logarithmic in the right-hand side, the authors in [24] gave the analytical side of the following problem:

\[ u_t - \Delta u - \Delta u_t = u \ln u. \]  

Then, in [27], Nhan and Truong studied the global existence, decay together with the blow up solutions of the following problem:

\[ u_t - \div (|\nabla u|^{p-2}\nabla u) - \Delta u_t = |u|^{p-2}u \ln |u|, \]  

where \( p > 2 \). In addition, in [25], Cao and Liu gave for \( 1 < p < 2 \), the blow up and global boundedness results of problem (5).

Most recently, in [14], Piskin et al. studied the \( p \)-Laplacian hyperbolic case

\[ u_{tt} - \div (|\nabla u|^{p-2}\nabla u) + |u|^{p-2}u + u_t = |u|^{p-2}u \ln |u|, \quad x \in \Omega, \quad t > 0. \]  

Motivated by the last mentioned papers, especially [14], in this current research, we consider problem (1) with the presence of nonlinear diffusion \( \Delta_p = \div (|\nabla u|^{p-2}\nabla u) \), logarithmic nonlinearity \( |u|^{p-2}u \ln |u| \) together with a damping term which is an extension of the previous recent analytical study in [14], where the authors considered the hyperbolic case without damping terms. Our goal is to exploit a potential well method for problem (1) in order to obtain global existence and decay estimate of solutions. More precisely, we give the global existence and decay estimates of solutions under some sufficient conditions.

2. Preliminaries

In this section, we put the definitions and lemmas that we need in the rest of the paper:

\[ \|u\|_p = \|u\|_{L^p(\Omega)}, \quad \|u\|_{1,p} = \|u\|_{W^{1,p}_0(\Omega)} = \left( \|u\|_p^p + \|\nabla u\|_p^p \right)^{1/p}, \]  

for \( 1 < p < \infty \). We denote the positive constants by \( C \) and \( C_i \) \( (i = 1, 2, \ldots) \).

We give the function of energy by

\[ E(t) = \frac{1}{p} \|\nabla u\|_p^p + \frac{1}{p} \|u\|_p^p - \frac{1}{p} \int_\Omega \ln |u|u_t^2dx + \frac{1}{p^2} \|u\|_p^p. \]  

Lemma 1. \( E(t) \) is a nonincreasing function, for \( t \geq 0 \)

\[ E'(t) = -\|u_t\|^2 \leq 0. \]  

Proof. Multiplying equation (1) by \( u_t \) and using the integration on \( \Omega \), we have

\[ -\int_\Omega \div (|\nabla u|^{p-2}\nabla u)u_t dx + \int_\Omega |u|^{p-2}uu_t dx + \int_\Omega u_{tt} u_t dx = \int_\Omega u^{p-2}u \ln |u|u_t dx, \]  

\[ \frac{d}{dt} \left( \frac{1}{p} \|\nabla u\|_p^p + \frac{1}{p} \|u\|_p^p - \frac{1}{p} \int_\Omega \ln |u|u_t^2dx + \frac{1}{p^2} \|u\|_p^p \right) = -\|u_t\|^2. \]  

Thus,

\[ E'(t) = -\|u_t\|^2. \]

Lemma 2 (see [5, 14]). Let \( u \) be any function \( u \in W^{1,p}_0(\mathbb{R}^n) \setminus \{0\} \). Then, for \( p > 1, \mu > 0 \)

\[ \int_{\mathbb{R}^n} u^p \ln \left( \frac{|u|}{\|u\|_{L^p(\mathbb{R}^n)}} \right) dx \leq \mu \int_{\mathbb{R}^n} |\nabla u|^p dx - \frac{n}{p} \ln \left( \frac{\mu e}{n \mathcal{L}_p} \right) \int_{\mathbb{R}^n} |u|^p dx, \]  

where

\[ \mathcal{L}_p = \frac{p}{n} \left( \frac{p-1}{e} \right)^{p-1} \pi^{p/2} \left( \frac{\Gamma(n/2 + 1)}{\Gamma(n(p-1)/p + 1)} \right)^{p/n}. \]
Remark 3. Let \( u \in W^{1,p}_0(\Omega) \setminus \{0\} \) and by defining \( u(x) = 0 \) for \( x \in \mathbb{R}^n \setminus \Omega \), we can write

\[
P \int _{\Omega} u^p \ln \left( \frac{|u|}{\|u\|_{L^p(\Omega)}} \right) dx \leq \mu \int _{\Omega} |\nabla u|^p dx - \frac{n}{p} \ln \left( \frac{\mu e}{n^p} \right) \int _{\Omega} |u|^p dx.
\]

Lemma 4 (see [27]). Let \( \theta > 0 \). Therefore, we can easily give the following result:

\[
\log s \leq C \theta^p,
\]

\( \forall s \in [1, \infty) \), such as \( C = e^{-1/\theta} \).

Remark 5. According to Lemma 4, we have

\[
s^p \log s \leq C s^{p+\theta}, s \in [1, \infty).
\]

Lemma 6 (see [34]).

(i) For all function \( u \in W^{1,p}_0(\Omega) \), we have

\[
\|u\|_q \leq B_{q,p} \|\nabla u\|_{p'}
\]

for every \( q \in [1, \infty) \) if \( n \leq p \), and \( 1 \leq q \leq np/(n-p) \) if \( n > p \). We choose constant \( B_{q,p} \) related only on \( \Omega \), \( p \) and \( q \). Denote \( B_{q,p} \) by \( B_p \).

(ii) For every \( u \in W^{1,p}_0(\Omega) \), \( p \geq 1 \) with \( r > 1 \), we get

\[
\|u\|_q \leq C \|\nabla u\|_p \|u\|_{r'}^{-\alpha},
\]

where \( C > 0 \),

\[
\alpha = \left( \frac{1}{r} - \frac{1}{q} \right) \left( \frac{1}{n} - \frac{1}{p} + \frac{1}{r} \right)^{-1},
\]

and we have the following:

(i) \( p \geq n, 1 \leq r \leq q \leq \infty \)

(ii) \( n > 1 \) and \( p < n, q \in [r, (np/n-p)] \) if \( r \leq np/n-p \) and \( q \in [r, (np/n-p)] \) if \( r \leq np/n-p \)

(iii) \( p \leq n, 1 \leq r \leq q \leq \infty \)

(iv) \( p > n, 1 \leq r \leq q \leq \infty \)

### 3. Result of the Global Existence

We give in this section the proof of the global existence for (1). First, putting the following functionals:

\[
J(u) = \frac{1}{p} \|\nabla u\|^p_p + \frac{p+1}{p^2} \|u\|^q_p - \frac{1}{p} \int _{\Omega} \ln |u| |u'| dx,
\]

\[
I(u) = \|\nabla u\|^p_p + \|u\|^q_p - \int _{\Omega} \ln |u| |u'| dx.
\]

Hence, (21) and (22) give

\[
J(u) = \frac{1}{p} I(u) + \frac{1}{p^2} \|u\|^p_p,
\]

and we have

\[
E(u) = J(u).
\]

As in [35], the potential depth of the well is given as

\[
0 < d = \inf _{u} \left\{ \sup _{\lambda \geq 0} J(\lambda u): u \in W^{1,p}_0(\Omega), \|u\|^p_p \neq 0 \right\},
\]

\[
0 < d = \inf _{t \in \mathbb{R}} I(t).
\]

Hence, two sets can be assigned, the first stable \( W \) and the second \( V \) unstable by

\[
W = \left\{ u \in W^{1,p}_0(\Omega): J(u) < d, I(u) > 0 \right\} \cup \{0\},
\]

\[
V = \left\{ u \in W^{1,p}_0(\Omega): J(u) < d, I(u) < 0 \right\}.
\]

Lemma 7. Let \( u \) be all function \( u \in W^{1,p}_0(\Omega) \setminus \{0\}, \|u\|^p_p \neq 0 \) and let \( \lambda = J(\lambda u) \). Hence, we have

(i) \( \lim _{\lambda \to -\infty} g(\lambda) = -\infty \), \( \lim _{\lambda \to \lambda^*} g(\lambda) = 0 \)

(ii) \( I(\lambda u) = \lambda g'\left( \frac{1}{\lambda} \right) \)

where

\[
\lambda^* = \exp \left( \frac{\|\nabla u\|^p_p + \|u\|^q_p - \int _{\Omega} \ln |u| |u'| dx}{\|u\|^q_p} \right)
\]

\[
\lambda > 0, 0 \leq \lambda < \lambda^*,
\]

\[
\lambda = \lambda^*,
\]

\[
\lambda < \lambda^* < \infty,
\]

Proof.

(i) From \( g(\lambda) \) which we get
\[ g(\lambda) = J(\lambda u) = \frac{1}{p} ||\lambda \nabla u||_p^p + \frac{p+1}{p^2} ||\lambda u||_p^p - \frac{1}{p} \int_{\Omega} \ln ||\lambda u||_p^p dx + \frac{\lambda^p}{p} \left( \frac{p+1}{p} - \ln |\lambda| \right) ||u||_p^p - \frac{\lambda^p}{p} \int_{\Omega} \ln ||u||_p^p dx. \]  

According to \( ||u||_p^p \neq 0 \), we find \( \lim_{\lambda \to -\infty} g(\lambda) = -\infty \), and \( \lim_{\lambda \to 0} g(\lambda) = 0. \)

(ii) From the derivative of \( g(\lambda) \), we get

\[ g'(\lambda) = \frac{d}{d\lambda} g(\lambda u) = \lambda^{p-1} \left( ||\nabla u||_p^p + (1 - \ln |\lambda|) ||u||_p^p \right) - \int_{\Omega} \ln ||u||_p^p dx. \]

There exists a unique \( \lambda^* \) verify \( (d/d\lambda) J(\lambda u) |_{\lambda=\lambda^*} \), by taking

\[ \lambda^* = \exp \left( \frac{||\nabla u||_p^p + ||u||_p^p - \int_{\Omega} \ln ||u||_p^p dx}{||u||_p^p} \right). \]

Of course, we note that the recent property is the result of the following:

\[ \lambda \frac{d J(\lambda u)}{d\lambda} = \lambda g'(\lambda) = I(\lambda u). \]

Thus, we have the desired results such that

\[ I(\lambda u) = \lambda g'(\lambda) \begin{cases} >0, & 0 \leq \lambda < \lambda^*, \\ =0, & \lambda = \lambda^*, \\ <0, & \lambda < \lambda^* < \infty. \end{cases} \]

**Lemma 8.** For every \( u \in W_0^{1,p}(\Omega) \setminus \{0\} \) and \( l = e^{(\alpha + \beta)/p^*} (p^*/n\mathcal{D})^{\alpha p^{*}} \), we get

(i) If \( 0 < ||u||_p < l \), then \( I(u) > 0 \)

(ii) If \( I(u) < 0 \), then \( ||u||_p > l \)

(iii) If \( I(u) = 0 \), then \( ||u||_p \geq l \)

**Proof.** According to inequality of logarithmic Sobolev, it can be found

\[ I(u) = ||\nabla u||_p^p + ||u||_p^p - \int_{\Omega} \left( \frac{|u|}{||u||_p} + \ln ||u||_p \right) ||u||_p^p dx \]

\[ \geq ||\nabla u||_p^p + \left( 1 - \ln ||u||_p \right) ||u||_p^p \]

\[ - \mu \int_{\Omega} |\nabla u|^p dx - \frac{n}{p^2} \ln \left( \frac{p\mu}{n\mathcal{D}} \right) \int_{\Omega} ||u||_p^p dx \]

\[ \geq \left( 1 - \frac{\mu}{p} \right) ||\nabla u||_p^p + \left( 1 - \ln ||u||_p + \frac{n}{p^2} \ln \left( \frac{p\mu}{n\mathcal{D}} \right) \right) ||u||_p^p. \]

Selecting \( \mu = p \) in (34) gives

\[ I(u) \geq \left( 1 - \ln ||u||_p + \frac{n}{p^2} \ln \left( \frac{p^2 \mu}{n\mathcal{D}} \right) \right) ||u||_p^p. \]

Thus, we have

(i) If \( 0 < ||u||_p < l \), then \( I(u) > 0 \) using the last inequality

(ii) Suppose that \( I(u) < 0 \). This is due to (35), and it

\[ ||u||_p \geq e^{(\alpha + \beta)/p^*} \left( \frac{p^2}{n\mathcal{D}} \right)^{\alpha p^{*}} = l \]

(iii) Similar to the proof of (ii), we prove (iii)

As for functional \( J \), it represents the Nehari manifold

\[ \mathcal{N} = \left\{ u \in W_0^{1,p}(\Omega) \setminus \{0\} : I(u) = 0 \right\}. \]

Using Lemma 7 in order to prove that \( \mathcal{N} \) is an unempty set, consider that if \( u \in \mathcal{N} \), we obtain

\[ J(u) = \frac{1}{p} ||u||_p^p. \]

We use (23). Further, it proves that \( J \) is coercive with respect to \( \mathcal{N} \). In addition, if we give \( \Omega_1 \) and \( \Omega_2 \) such that

\[ \Omega_1 = \{ x \in \Omega : |u(x) < 1| \}, \]

\[ \Omega_2 = \{ x \in \Omega : |u(x) \geq 1| \}. \]
From Remark 5, we can get that
\[
\int_{\Omega} |u|^p \ln |u| \, dx \leq \int_{\Omega_1} |u|^p \ln |u| \, dx + \int_{\Omega_2} |u|^p \ln |u| \, dx
\]
\[
\leq C \int_{\Omega_2} |u|^{p+\epsilon} \, dx \leq C\|u\|_{p+\epsilon, C}^p,
\]
where \(\epsilon > 0\). Under Lemma 6, we get
\[
\int_{\Omega} \ln |u| |u|^p \, dx \leq C\|u\|_{p+\epsilon, C}^p \leq C\|\nabla u\|_p^{(p+\epsilon)\beta} \|u\|_{p}^{(1-\beta)(p+\epsilon)\beta},
\]
where
\[
\alpha = \left(\frac{1}{p} - \frac{1}{p+\epsilon}\right) \left(\frac{1}{n} - \frac{1}{p} + \frac{1}{p}\right)^{-1} = \frac{n\epsilon}{p(p+\epsilon)}.
\]
Choosing \(\epsilon p^2/n\), we obtain
\[
\alpha(p+\epsilon) < p.
\]
By using Young’s inequality together with (41), we get
\[
\int_{\Omega} |u|^p \ln |u| \, dx \leq \varepsilon \|\nabla u\|_p^p + C_\epsilon \left(\|u\|_p^p\right)^\beta,
\]
where \(\varepsilon > 0\) and \(\beta = (1-\alpha)(p+\epsilon)/p - \alpha(p+\epsilon) > 1\). As \(u \in \mathbb{N}\), by (22) and (44), we get
\[
\|u\|_p^p + \|\nabla u\|_p^p \leq \int_{\Omega} |u|^p \ln |u| \, dx,
\]
\[
\|u\|_p^p + \|\nabla u\|_p^p \leq \varepsilon \|\nabla u\|_p^p + C_\epsilon \left(\|u\|_p^p\right)^\beta,
\]
\[
\|\nabla u\|_p^p \leq \varepsilon \|\nabla u\|_p^p + C_\epsilon \left(\|u\|_p^p\right)^\beta,
\]
\[
(1-\varepsilon) \|\nabla u\|_p^p \leq C_\epsilon \left(\|u\|_p^p\right)^\beta.
\]
Select \(\varepsilon < 1\). Then, combining (38) and (44), we find
\[
J(t) = \frac{1}{p^2} \|u\|_p^p \geq C_\epsilon \left(\|\nabla u\|_p^p\right)^{1/\beta}.
\]
Hence, the coercivity of \(J\) on \(\mathbb{N}\).

Lemma 9.

(i) The depth of the potential well is given by
\[
d = \inf_{u \in \mathbb{N}} J(u) = \inf_{u \in \mathbb{N}} \left\{ J(\lambda u) : u \in W_0^{1,p}(\Omega) \setminus \{0\}, \|u\|_p^p \neq 0 \right\}
\]
\[
(47)
\]
(ii) \(d\) admits a positive lower bound, given by
\[
d \geq \frac{1}{p^2} e^{(n+p)p/2} \left(\frac{p^2}{n\mathcal{L}_p}\right)^{np} = \frac{p}{p^2} = K,
\]
where \(\mathcal{L}_p\) is given as in Lemma 2
(iii) There exists a positive function \(u \in \mathbb{N}\), verify \(J(u) = d\)
Proof.

(i) According to Lemma 7, it implies that for every \(u \in W_0^{1,p}(\Omega) \setminus \{0\}\), there exists a \(\lambda^*\), verify \(I(\lambda^* u) = 0\), that is \(\lambda^* u \in \mathbb{N}\). Using (47) gives
\[
J(\lambda^* u) \geq \inf_{u \in \mathbb{N}} J(u) = d.
\]

From Lemma 7, the maximizer of \(J(\lambda u)\) is exact \(\lambda^*\), such that
\[
\sup_{\lambda \geq 0} J(\lambda u) = J(\lambda^* u) = \frac{1}{p} I(\lambda^* u) + \frac{1}{p^2} \|\lambda^* u\|_p^p = \frac{1}{p^2} \|\lambda^* u\|_p^p.
\]

By the combination of (50) and (49), we find
\[
\inf_{u \in W_0^{1,p}(\Omega) \setminus \{0\}} \sup_{\lambda \geq 0} J(\lambda u) = \inf_{u \in \mathbb{N}} J(\lambda^* u) \geq d.
\]

So that, as \(u \in W_0^{1,p}(\Omega) \setminus \{0\}\), we have \(d \neq 0\). And if \(u \in \mathbb{N}\) by (30), we obtain that \(\lambda^*\) is the only critical point in \((0, \infty)\) of the mapping \(g(\lambda)\). Therefore,
\[
\sup_{\lambda \geq 0} J(\lambda u) = J(u),
\]
for any \(u \in \mathbb{N}\). Then,
\[
\inf_{u \in W_0^{1,p}(\Omega) \setminus \{0\}} \sup_{\lambda \geq 0} J(\lambda u) \leq \inf_{u \in \mathbb{N}} \sup_{\lambda \geq 0} J(\lambda u) = \inf_{u \in \mathbb{N}} J(u) = d.
\]

By (51) and (53), (i) is obtained.

(ii) From Lemma 7, \(\forall u \in W_0^{1,p}(\Omega) \setminus \{0\}\), we get \(I(\lambda^* u) = 0\). Lemma 8 gives
\[ \|\lambda^* u\|_p \geq e^{(n+p^2)/p^2} \left( \frac{p^2}{nL_p} \right)^{np^2} = l. \] (54)

By using (50) and (54), we get
\[ \sup_{\lambda > 0} J(\lambda u) \geq \frac{p^2}{nL_p} = K. \] (55)

According to (i), we find that \( d \geq K \).

(iii) Consider the minimize sequence \( \{u_k\}_k \subset u \in \mathbb{N} \) for \( J \), verify
\[ \lim_{k \to \infty} J(u_k) = d. \] (56)

Hence, we have \( \{u_k\}_k \subset u \in \mathbb{N} \) is also a minimizing sequence for \( J \) due to \( |u_k| \subset u \in \mathbb{N} \) and \( J(|u_k|) = J(u_k) \). For this, we can suppose that \( u_k \to 0 \) a.e. \( \Omega \) for any \( k \in \mathbb{N} \).

From it, we note that \( J \) is coercive on \( u \in \mathbb{N} \); in other words, \( \{u_k\}_k \) is bounded in \( W_0^{1,p}(\Omega) \). Since \( W_0^{1,p}(\Omega) \cap L^p(\Omega) \) is compact embedding, \( \exists u \) is a function and a subsequence of \( \{u_k\}_k \), still given by \( \{u_k\}_k \), such that
\[ u_k \to u \text{ weakly in } W_0^{1,p}(\Omega), \]
\[ u_k \to u \text{ strongly in } L^p(\Omega), \]
\[ u_k(x) \to u(x) \text{ a.e. in } \Omega. \] (57)

Hence, \( u \geq 0 \) on \( \Omega \) and
\[ J(t) = \frac{1}{p} \|\nabla u\|_p^p + \frac{p+1}{p} \|u\|_p^p - \frac{1}{p} \int_{\Omega} \ln |u|^p dx \]
\[ \leq \liminf_{k \to \infty} \left( \frac{p+1}{p} \|u_k\|_p^p + \frac{1}{p} \|\nabla u_k\|_p^p - \frac{1}{p} \int_{\Omega} \ln |u_k|^p dx \right) \]
\[ = \liminf_{k \to \infty} J(u_k) = d. \] (58)

We apply Lebesgue dominated convergence theorem and weak lower semicontinuity.

As \( u_k \in u \in \mathbb{N} \), we have \( u_k \in W_0^{1,p}(\Omega) \setminus \{0\} \) and \( I(u_k) \) which implies
\[ \|u_k\|_p \geq e^{(n+p^2)/p^2} \left( \frac{p^2}{nL_p} \right)^{np^2} = l. \] (59)

According to Lemma 8, we have \( \|u\|_p \neq 0 \) converge strongly in \( L^p(\Omega) \); that is to say, that \( u \in W_0^{1,p}(\Omega) \setminus \{0\} \). Moreover, using weak lower continuity, we find
\[ I(u) = \|u\|_p^p + \|\nabla u\|_p^p - \frac{1}{p} \int_{\Omega} \ln |u|^p dx \]
\[ \leq \liminf_{k \to \infty} \left( \|u_k\|_p^p + \|\nabla u_k\|_p^p - \frac{1}{p} \int_{\Omega} \ln |u_k|^p dx \right) \]
\[ = \liminf_{k \to \infty} I(u_k) = 0. \] (60)

As a final stage of proof (iii), we prove that \( I(u) = 0 \). If this is false, we get \( I(u) < 0 \); hence, by Lemma 7, \( \exists \lambda^* < 1 \) which verifying \( I(\lambda^* u) = 0 \). Further, we find
\[ 0 < d \leq J(\lambda^* u) = \frac{1}{p^2} \|\lambda^* u\|_p^p \leq \frac{(\lambda^*)^p}{p^2} \liminf_{k \to \infty} \inf \|u_k\|_p^p \]
\[ = (\lambda^*)^p \liminf_{k \to \infty} J(u_k) = (\lambda^*)^p d < d. \] (61)

And it produces a stark contrast. Meaning that the proof of Lemma 9 has ended.

Definition 10. We say that function \( u(t) \) represents a weak solution to problem (1) on \( \Omega \times [0, T) \), if
\[ u \in C \left( (0, T) ; W_0^{1,p}(\Omega) \right) \cap C^1 \left( (0, T) ; L^2(\Omega) \right), \]
\[ u_t \in L^\infty \left( (0, T) ; L^2(\Omega) \right) \] (62)

satisfies
\[ \begin{cases} \int_{\Omega} |\nabla u|^p \nabla u \nabla w dx + \int_{\Omega} |u|^{p-2} u w(x) dx + \int_{\Omega} u_t w(x) dx = k \int_{\Omega} \ln |u(x, t)| |u|^{p-2}(x, t) w(x) dx, \forall w \in H_0^1(\Omega), \\ u(x, 0) = u_0(x). \end{cases} \] (63)

Lemma 11. Let \( u_0 \in W_0^{1,p}(\Omega) \setminus \{0\} \) and \( l = e^{(n+p^2)/p^2} \left( p^2/nL_p \right)^{np^2} \). Suppose that \( 0 < E(0) < F/p^2 < d \).

(i) If \( u_0 \in \mathbb{W} \), then \( u \in \mathbb{W} \) for \( 0 \leq t \leq T \)

(ii) If \( u_0 \in \mathbb{V} \), then \( u \in \mathbb{V} \) for \( 0 \leq t \leq T \).

Proof.

(i) We put \( T \) is the maximum time of existence of solution \( u \). From (24) combined with (47), we find...
\[
J(u) \leq J(u_0) < d, \forall t \in [0, T). 
\]

(64)

Then, we have \(u(t) \in W\) for every \(t \in [0, T)\). If it is false, hence \(\exists t_0 \in [0, T)\) verify \(u(t_0) \in \partial W\), we get either \(I(u_0) = 0\) and \(\|\Delta(u_0)\| \neq 0\) or (b) \(J(u_0) = d\).

According to (64), (b) is impossible, that is, \(I(u_0) = 0\) and \(\|\Delta(u_0)\| \neq 0\). But it is \(\exists \|u(t)\| \geq d\) if \(0 < d = \inf_{u \in W} J(u)\).

From this, we have a stark contrast, \(u(t) \in W\) is obtained for \(\forall t \in [0, T)\).

(ii) In the same way, we prove case (ii)

**Theorem 12.** Consider \(u_0(x) \in W^{1,p}_0(\Omega) \setminus \{0\}\). If \(I(u_0) > 0\) and \(E(0) < d\) or \(\|u_0\|^p_p = 0\). Therefore, problem (I) admits a weak global solution \(u(t) \in L^\infty(0,\infty; W^{1,p}_0(\Omega) \setminus \{0\})\), \(u_0(t) \in L^\infty(0,\infty; L^2(\Omega))\).

\[
\begin{aligned}
\int_\Omega |\nabla u_m|^p_p \nabla u_m \nabla \omega dx + \int_\Omega |u_m|^{p-2} u_m \omega dx + \int_\Omega u_m \omega dx = k \int_\Omega |u_m|^{p-2} (x,t) \ln |u_m(x,t)| \omega(x) dx, \omega \in V_m,
\end{aligned}
\]

(68)

It produces an ordinary differential equation system (ODE) made up of unknown functions \(h_j^m(t)\). Starting from the standard theory of existence, there are functions

\[
h_j : [0, t_m) \rightarrow \mathbb{R}, j = 1, 2, \ldots, m,\]

(69)

which verify (68) in a maximal interval \([0, t_m), 0 < t_m \leq T\). Next, we prove that \(t_m = T\) and that the local solution is uniformly bounded independent of \(m\) and \(t\). For this purpose, let us replace \(u\) by \(u_m^0\) in (68) and integrate by parts, we get

\[
\frac{d}{dt} E(t) = -\|u_m^0\|^2 \leq 0,
\]

(70)

such as

\[
E^m(t) = \frac{1}{p} \|\nabla u_m\|^p_p + \frac{p+1}{p^2} \|u_m\|^p_p - \frac{1}{p} \int_\Omega |u_m|^p p \ln |u_m^m| dx.
\]

(71)

Integrating (70) from 0 to \(t\), and using (24), we obtain

\[
J(u^m) + \int_0^t \|u_m^0\|^2 ds = E(0).
\]

(72)

Proof. Consider the orthogonal basis \(\{w_j\}_{j=1}^\infty\) of the “separable” space \(W^{1,p}_0(\Omega)\) which is orthonormal in \(L^2(\Omega)\). Let the following subspace \(V_m\) on the finite dimensional

\[
V_m = \text{span}\{w_1, w_2, \ldots, w_m\},
\]

(65)

where the projections of the initial data be defined by

\[
u_0^m(x) = \sum_{j=1}^m a_j w_j(x) \rightarrow u_0 in H^1_0(\Omega),
\]

(66)

for all \(j = 1, 2, \ldots, m\).

Now, we can see the approximated solutions of (1) as in the following form

\[
u_m(x,t) = \sum_{j=1}^m h_j^m(t) w_j(x),
\]

(67)

of the approximate problem in \(V_m\).

According to (68), with \(m \rightarrow \infty\), we find \(E^m(0) \rightarrow E(0)\).

We select \(m\) large enough; we find

\[
J(u^m) + \int_0^t \|u_m^0\|^2 ds < d.
\]

(73)

Hence, by (23), we have

\[
J(u) = \frac{1}{p} \|u\|^p_p + \frac{1}{p^2} \|u\|^p_p.
\]

(74)

By \(u_0 \in W\),

\[
J(u^m(0)) = E(0); \quad J(u^m(0)) = E(0);
\]

(75)

we select \(m\) large enough and \(0 \leq t < \infty\); we find \(u^m(0) \in W\). By (24) and Lemma 11, by picking \(m\) large enough and \(0 \leq t < \infty\), we get \(m(t) \in W\). Further, according to (24) and (21), we obtain

\[
\frac{1}{p} \|\nabla u_m^0\|^p_p + \frac{p+1}{p^2} \|u_m\|^p_p - \frac{1}{p} \int_\Omega |u_m|^p p \ln |u_m^m| dx + \int_0^t \|u_m^0\|^2 ds < d,
\]

(76)
where \(0 \leq t < \infty\). By choosing \(m\) large enough and \(0 \leq t < \infty\) (76), we get

\[
\|\nabla u^m\|_p^p < pd,
\]

\[
u^m\|_p^p < \frac{p^2}{p+1}d,
\]

\[
\int_0^t \|u_t^m\|^p \, dt < d.
\] (77)

According to Remark 5, we find

\[
\int_{\Omega} |u^m|^p \ln |u^m| \, dx \leq \int_{\Omega_1} |u^m|^p \ln |u^m| \, dx + \int_{\Omega_2} |u^m|^p \ln |u^m| \, dx \leq C\int_{\Omega_2} |u^m|^p \ln |u^m| \, dx \leq C\|u^m\|_{p+\zeta}^p,
\]

where \(\zeta\) is pick satisfying \(p + \zeta < np/(n - p)\) as \(p < n\) and \(\zeta > 0\) as \(p \geq n\) and \(\Omega_1 = \{x \in \Omega : |u^m(x)| < 1\}\) and \(\Omega_2 = \{x \in \Omega : |u^m(x)| \geq 1\}\).

Applying the embedding theorem, Lemma 6 and Young’s inequality, gives from (78):

\[
\int_{\Omega} \ln |u^m| \|u^m\|_p^p \, dx \leq C\|u^m\|_{p+\zeta}^p \leq C\|\nabla u^m||_{p+\zeta}^p ||u^m||^{(1-\alpha)(p+\zeta)} \leq C\|\nabla u^m||_{p+\zeta}^p + C_\varepsilon \left(\|u^m\|_p^{(1-\alpha)(p+\zeta)} \right) \leq C_\varepsilon \|u^m\|_{p+\zeta}^p.
\] (79)

Therefore, we choose \(0 < \zeta\) for \(p > \alpha(p + \zeta)\), where \(\varepsilon \in (0, 1)\) with

\[
\alpha = \frac{1}{p} - \frac{1}{p+\zeta} \left(\frac{1}{n} - \frac{1}{p+1}\right) > \frac{(1-\alpha)p(p+\zeta)}{p - \alpha(p+\zeta)} > 1.
\] (80)

Using (79) and (76), for \(0 \leq t < \infty\), we find

\[
\int_{\Omega} \ln |u^m| |u^m|^p \, dx < C_\varepsilon pd.
\] (81)

Hence, we get

\[
\begin{cases}
u^m \text{ is uniformly bounded in } L^\infty(0,\infty; W_0^{1,p}(\Omega)), \\
u_t^m \text{ is uniformly bounded in } L^\infty(0,\infty; L^2(\Omega)).
\end{cases}
\] (82)

Using the integration on (68), we get for \(0 \leq t < \infty\)

\[
\int_\Omega u^m \omega_0 \, dx = \int_0^t \int_\Omega |u^m|^k |u^m|^{-1} \omega_0 \, dxds - \int_0^t \int_\Omega |\nabla u^m|^2 \omega_0 \, dxds - \int_0^t \int_\Omega |u^m|^{p-2} |u^m| \omega_0 \, dxds.
\] (83)

Further, after passing through the limit in (ref 4030), we arrive at the weak solution left (u right) to the problem (ref 300). According to the initial data in (ref 300), we conclude that \((u(x, 0)) = (u_0) \in W_0^{1,p}.

4. Decay of Solution

In this section, by using the Lyapunov functional, we show the decay of solution to (1).

First, we define the Lyapunov functional by

\[
L(t) = E(t) + \varepsilon \int_\Omega u^2 \, dx,
\] (84)

where \(\varepsilon > 0\). We will prove the equivalence between \(L(t)\) and \(E(t)\).

**Lemma 13.** For \(\varepsilon > 0\) small enough, we have

\[
\beta_1 L(t) \leq E(t) \leq \beta_2 L(t),
\] (85)

where \(\beta_1, \beta_2 > 0\).

We find \(L \sim E\) by choosing \(\varepsilon\) small enough.

**Theorem 14.** Let \(u_0 \in V\). Assume further \(0 < E(0) < (p+1)/p^2 \mu^p < d\), where

\[
l = e^{t\gamma} e^{(1-p)/p\mu^p} \left(\frac{p^2}{n\mathcal{L}^p}\right)^{n/p},
\]

\[
\mu^2 = e^{(1-p)/p\mu^p} \left(\frac{p}{n\mathcal{L}^p}\right)^{1-p/p} < \mu < \frac{p(\beta - p) + \beta C^*}{(\beta - p)};
\] (86)

hence, \(\exists c_1, c_2 > 0\) satisfies

\[
0 < E(t) \leq c_1 e^{-c_2 t}, \quad t \geq 0.
\] (87)

**Proof.** A differentiation of \(L(t)\) and equation (1) gives

\[
L'(t) = E'(t) + \varepsilon \int_\Omega \mu u dx = -\|u_t\|^2 - \varepsilon \left(\|\nabla u\|_p^2 + \|u\|_p^2\right) + \varepsilon \int_\Omega \ln |u| \mu^p \, dx.
\] (88)
Adding and subtracting $\varepsilon \beta E(t)$ into (88) ($\beta > 0$), we obtain

$$L'(t) = -||u||^2 + \varepsilon \left( \frac{\beta - p}{p} \right) ||\nabla u||^p + \varepsilon \left( \frac{\beta - p}{p} \right) ||u||^p$$
$$+ \epsilon \left( 1 - \frac{\beta}{p} \right) \int_{\Omega} |u| u^p dx + \varepsilon \left( 1 - \frac{\beta}{p} \right) \int_{\Omega} |u|^p dx - \varepsilon \beta E(t)$$
$$\leq -||u||^2 + \varepsilon \left( \frac{\beta - p}{p} \right) \left( 1 + \frac{C^* \beta}{p(\beta - p)} \right) ||\nabla u||^p$$
$$+ \epsilon \left( \frac{\beta - p}{p} \right) ||u||^p + \epsilon \left( 1 - \frac{\beta}{p} \right) \int_{\Omega} |u| u^p dx.$$  

(89)

Using the inequality of logarithmic Sobolev together with $||u||_p^p \leq C^* ||\nabla u||^p (C^* > 0)$ gives

$$L'(t) \leq -||u||^2 + \varepsilon \left( \frac{\beta - p}{p} \right) \left( 1 + \frac{C^* \beta}{p(\beta - p)} \right) ||\nabla u||^p$$
$$+ \epsilon \left( \frac{\beta - p}{p} \right) ||u||^p + \epsilon \left( 1 - \frac{\beta}{p} \right) \int_{\Omega} |u| u^p dx - \varepsilon \beta E(t)$$
$$\leq -\varepsilon \beta E(t) - ||u||^2 + \varepsilon \left( \frac{\beta - p}{p} \right) \left( 1 + \frac{C^* \beta}{p(\beta - p)} - \frac{\mu}{p} \right) ||\nabla u||^p$$
$$- \epsilon \left( \frac{\beta - p}{p} \right) \left( \ln ||u||^p - \left( \frac{n}{p^2} \ln \left( \frac{p \mu c}{n \mathcal{F}_p} \right) + 1 \right) \right) ||u||^p.$$  

(90)

Noting that $0 < \beta < p$ and using (21) and Theorem 12, we find

$$\ln ||u||_p \leq \ln \left( \frac{p^2}{p + 1} f(u) \right) \leq \ln \left( \frac{p^2}{p + 1} E(t) \right)$$
$$\leq \ln \left( \frac{p^2}{p + 1} E(0) \right) \leq \ln (\mu p^2)$$
$$= \ln \left( \mu e^{\mu p^2} \left( \frac{p \mu c}{n \mathcal{F}_p} \right)^{\frac{n}{p^2}} \right).$$  

(91)

By $\mu$ satisfying

$$\mu e^{\mu p^2} e^{(1 - p)(\mu p^2)} \left( \frac{p}{n \mathcal{F}_p} \right)^{1 - p/p} < \mu < \frac{p(\beta - p) + \beta C^*}{(\beta - p)},$$  

(92)

we guarantee

$$\left( 1 + \frac{C^* \beta}{p(\beta - p)} - \frac{\mu}{p} \right) > 0,$$

(93)

and

$$\ln ||u||_p - \left( \frac{n}{p^2} \ln \left( \frac{p \mu c}{n \mathcal{F}_p} \right) + 1 \right) > 0;$$  

(94)

then, we obtain

$$L'(t) \leq -\varepsilon \beta E(t) - ||u||^2.$$  

(95)

Hence, inequality (95) becomes

$$L'(t) \leq -\varepsilon \beta E(t).$$  

(96)

According to (85), we get

$$L'(t) \leq -\varepsilon \beta \beta L(t).$$  

(97)

Setting $c_2 = \varepsilon \beta \beta > 0$ and integrating (97) yield

$$L(t) \leq c_1 e^{-c_2 t}.$$  

(98)

Finally, by (85), we obtain (87). This is the end of the proof.

### 5. Conclusion

As mentioned earlier in the introduction, the majority of problems in science are nonlinear and their analytical solutions are not easy to find, and most physical problems mostly use higher nonlinear partial differential equations (PDEs). It has been found to be extremely difficult to find accurate or analytical solutions to such problems. However, in the past several centuries, many scientists have made great progress and adopted various techniques to study the analytical side of these famous problems, and nonlinear logarithmic has also received much attention from physicists and mathematicians. Log nonlinearity was introduced into the relativistic wave equation describing spinning particles moving in an external electromagnetic field and in the relativistic wave equation (see, for example, [1–3, 6, 14, 18, 19, 29, 36, 37]); in this contribution, under some sufficient initial and boundary conditions, we have studied the analytical side of p-Laplacian heat equations with respect to logarithmic nonlinearity in the right-hand side, where the global existence and decay estimates of weak solutions are proved. In the next work, we extend our recent work to the coupled system for this important problem. Also, some numerical examples will be given in order to ensure the theory study by using some famous algorithms which are presented in [38, 39].

### Data Availability

No data were used to support the study.

### Conflicts of Interest

The authors declare that they have no conflicts of interest.
