Case of elderly abuse and violence against women: nose amputation

Yaşlı İstismarı ve Kadına Şiddet Olgusu: Burun Amputasyonu

ABSTRACT

Nose is an organ for breathing and smelling and an important aesthetic factor in the middle of the face and it is vulnerable to traumas. Thus, we encounter nosebleeds frequently particularly in violence cases. We aim to remember that violence can come across clinicians in different formats in elderly patients by discussing domestic violence, violence to women and elderly abuse on a rare case. In act of violence, there is also a tendency of attacking aesthetic organs and protruding organs due to their anatomical forms. We encounter the amputation of nasal pyramid in history as a punishment of adultery and thievery in ancient civilizations as law enforcements. Nose as an important aesthetic factor of face, is possible to be attacked on purpose in order to take revenge or is jealousy cases. Similar to our case, we might encounter it as a type of elderly abuse and violence against women. According to World Health Organization Toronto Declaration, elderly abuse is: “acts of one or multiple inconvenient behaviors that harm the elders or distress them in a relationship with expectations of trust” Although nose replantation and reconstruction can be performed successfully with modern medical possibilities, erasing the marks of mental trauma is not easy at all. Therefore, in all age groups, legal acts must be done, educational programs and social society activities must be planned and creating awareness must be aimed in order to prevent violence and abuse. In abuse cases despite all protective measures, as a part of secondary and tertiary protection, it is significant to provide social and medical support and follow-up in oncoming periods.

Keywords: elderly abuse, violence, trauma, amputation, nose
Introduction

Violence, except defence and counter claim, described in dictionary as “vulgar power”; is considering the presence of others as a threat in order to provide dominance and a psychological pattern of behavior intended to harm others and it can be seen in people and wild animals (1).

Nose is an organ for breathing and smelling and an important aesthetic factor in the middle of the face. In its structure, muscle and skin is on bone and cartilage. When we examine its anatomy; nasal root, nasal wing and nasal apex forms the external nose. Vascularization of this area is provided by subsections of a.facialis, a.labialis superior, a. ophtalmica and a.maxillaris. nasal cavity (cavitas nasale) is split in half by septum nasi and it opens to nasopharynx in the back. Nose is split in three functionally. Vestibulum nasi is the slightly wide part of the nasal cavity and hair named vibrissae can be found here in order to prevent the passing of foreign bodies to the respiratory tract. The area named regio respiratoria is the vascular rich area behind vestibulum and it is related to respiration. In regio olfactoria, scent cells and their extension exist (2,3). Nose is vulnerably to trauma as a very important aesthetic component. Therefore, we encounter nose injuries frequently particularly in violence cases.

Old age; is a process that has unstoppable biological, chronological and social sides. Individuals usually lost their social standings in old age and become more dependent (4). According to World Health Organization Toronto Declaration, elderly abuse is: “acts of one or multiple inconvenient behaviors that harm the elders or distress them in a relationship with expectations of trust” (5). Violence against women, which is related closely to elderly abuse, is described as “in both public and private areas, an act which depends on gender that might/will give physical, sexual or psychological pain to women or threatening them with these kind of acts or forcing them or denying their independence arbitrarily” (6). We might encounter this in different forms like physical, emotional and economical violence.

Emotional violence is thought to be the most common violence against women and it is a type of gender apartheid. Correctly reporting the violence findings in these cases in terms of forensic medicine might prevent repetitive violence and providing social and psychiatric support to victims of violence might minimize the damage of trauma. We aim to remember that violence can come across clinicians in different formats in elderly patients by discussing domestic violence, violence to women and elderly abuse on a rare case.

CASE:

It is recorded that, an 83 years old female patient was brought to the emergency room of our hospital by 112 teams, her general situation was fine, she was conscious, oriented and cooperated, her vital findings were stabilized. In her physical examination performed by plastic surgery department; it was recorded that a total amputation that includes alar layers with columella and ranges from rinio on the tip of the nose to alar base was found, there were no malar asymmetry, bilateral frontal area, upper rims, lower rims and zygomatic arcs were natural with palpation, there were no step deformity, maxilla drawer test was negative, mandibular continuity was natural, temporomandibular joint examination was natural, sensory examination was natural, eye movements couldn’t be examined due to periorbital oedema. In the tomography performed in our hospital, it was recorded that displaced fractures in nasal and ethmoid bones were determined and that it was suggested to hospitalize the patient in order to operate. The
nose reconstruction was done with the person’s forehead flap.

In our evaluation due to the consultation requested in terms of judicial reporting; the history of the incident was gathered from the patient’s daughter due to lack of communication with the patient who has low hearing. She stated that, her parents argue frequently, they had fights before but injuries were mild, first her father beat her mother then tear off her mother’s nose with a knife, she found out about the incident from her brothers, there were nobody near her parents while the incident was happening. Also she said that; ampute nose piece was not found in there. In the examination of the patient; her general situation was fine, she was conscious, her vital findings were stabilized, in her external examination; there was a 2x1cm² purple colored ecchymose in midline of frontal area, 2x2cm² dark-colored ecchymose in the left side of her forehead and oedema around right orbita and concomitant extensive ecchymose (fig 1).

It was determined that nose was cut full-thickness starting from the nasal dorsum and including bilateral upper and lower cartilage tissue and amputated, the wound lips were smooth (fig 2),

there was no other traumatic lesion except her face, motor, sensory and neurologic examination was natural, there were no other pathologies. In the evaluation of the patient file, it was determined that her hemoglobin was 11.5 g/dl and haematocrit was 33.8% at the outer center, in the examination in our hospital, her hemoglobin was 11.7 g/dl and her haematocrit was 34.5%, patient had no severe blood loss.

DISCUSSION:

Nose traumas usually occur in childhood and due to an accident. Rarely, animal bites might also cause injuries that include amputation of nose (7). In act of violence, there is also a tendency of attacking aesthetic organs and protruding organs due to their anatomic forms. While a boxing match in 1997, a boxer biting his opponent’s ear and causing a subtotal amputation in an example for this. In history of humanity; we observe injuries of protruding parts of bodies (lips, tongue, chest, hands, genitals, nose, ears) due to judicial punishments (fig 3). We encounter the amputation of particularly nasal pyramid as a law enforcement in ancient civilizations. There is evidence of performing this amputation in several civilizations as a punishment of adultery and thievery. Mummies that belong to ancient Egypt civilization that were examined also supports the other evidences. We can see that this punishment is also performed on some political dissidents. We can also see that women in 9th century interestingly performed these injuries on themselves; it was stated that a priestess cut her own nose in order to look ugly and prevent the occupying soldiers to rape her (8). In today’s world, in some societies, cutting of aesthetic organs such as nose is applied as a punishment method. In the recent past, a 12-year-old forced marriage bride, a famous magazine cover issue, is also the victim of this punishment system (9).

In literature, behaviors like self-mutilation and eating the ruptured limb parts are observed in patients with psychotic disorder (10). Nose as an important aesthetic factor of face, is possible to be attacked on purpose in order to take revenge or is jealousy cases. Similar to our case, we might encounter it as a type of elderly abuse and violence to women. Although nose reimplantation and reconstruction can be performed successfully with modern medical possibilities, erasing the marks of mental trauma is not easy at all (11,12).

Population aged 60 and above which is 11.7% of the society in 2013 is predicted to pass beyond 21% and 2 billion in numbers in 2050 (13). Thus, elderly abuse is treated as an important public health problem recently. Elderly abuse has 5 types; physical, verbal or psychological, economical, sexual abuse and omission (14). It is shown that more than half of the elderly abuse, which is seen frequently in many societies but hard to reveal, is performed by partners. Risk factors for abuse are just like they are in youth; poor socioeconomic circumstances of partners, unemployment and drug abuse. In all age groups, legal acts must be done, educational programs and social society activities must be planned and creating awareness must be aimed in order to prevent violence and abuse.

Despite all the protective measures, in abuse cases, it is significant for patient to get medical and social support in early periods. Recording all kinds of abuse findings despite seeming simple and unimportant, reporting as a judicial case and preparing a correct judicial medical report by medical service providers has a big role on preventing the occurrence of bigger traumas. Reporting people with repetitive or severe trauma findings to ministry in order to provide social protection, providing rehabilitation and consultancy services might prevent abuses and minimize the trauma findings.
