Retiform purpura and ischemic limb gangrene with pulses

Qiang Nai, Rafay Khan, Sabrina Arshed, Shuvendu Sen, John Middleton

CASE REPORT

A 48-year-old female with a history of alcoholism was admitted for septic shock. She had vomiting, diarrhea, and confusion of one day duration prior to admission. Vital signs were blood pressure 84/54 mmHg, pulse 125 bpm, respiratory rate 22/minute, temperature 35.7°C; physical examination revealed confusion and hallucination; diffuse rash and edema over the face, neck and shoulders, which were preceded by insect bites to upper eyelids. Initial laboratory tests showed hemoglobin 12.6 g/dL, hematocrit 38.9%, white blood cell count 17.5x10^3/µL, platelet 102 cx10^3/µL, band 52%, d-dimer >35.2 µg/mL, fibrin degradation product >20 µg/ml, fibrinogen 209 mg/dL, IgE 1,732 IU/mL, troponin I 1.08 ng/mL, creatinine kinase (CK) 5,933 IU/L, CK-MB 49.55 ng/mL, INR 1.3, sodium 126 mmol/L, potassium 3.1 mmol/L, chloride 87 mmol/L, bicarbonate 9 mmol/L, BUN 12 mg/dL, creatinine 1.3 mg/dL, glucose 120 mg/dL, calcium 7.0 mg/dL, magnesium 1.0 mg/dL, phosphorus 6.5 mg/dL, albumin 2.2 g/dL, alcohol 26.7 mg/dL, total bilirubin 1.3 mg/dL, alkaline phosphatase 71 U/L, AST 111 U/L, AST 43 U/L. Arterial blood gas showed: pH 7.12, PCO₂ 22 mmHg, PO₂ 120 mmHg, bicarbonate 7.2 mmol/L, FiO₂ 27%. The lungs were clear on chest X-ray, EKG showed sinus tachycardia, and echocardiogram was normal. The test results suggested rhabdomyolysis and disseminated intravascular coagulopathy (DIC) that was likely triggered by bacterial endotoxin related to facial infection. However, the microbiology studies were negative.

Patient was given broad spectrum antibiotics including vancomycin, piperacillin (that was subsequently switched to imipenem), fluconazole, acyclovir, as well as permethrin cream pediculosis capitis. Aggressive intravenous fluid and multiple vasopressors were administered to maintain the blood pressure. Fever and acute respiratory distress syndrome occurred shortly after admission, and she was subsequently intubated. The upper eyelid and radix evolving necrosis (Figure 1A) necessitated multiple debridements. Retiform purpura developed in hands (Figure 1B) blisters on dorsum and feet (Figure 1C) despite detectable pulses (cross marks). Thrombosed planter cutaneous veins became apparent six days after admission. Skin punch biopsy and subsequent histology study revealed mild fibrinoid necrosis of the upper dermis and bulla formation with complete separation at the epidermal junction. Ischemic limb gangrene with pulses occurred in the lower extremities (Figure 1D–E), which led to bilateral below knee amputation.
DISCUSSION

We report a case of ischemic limb gangrene with pulses in a female patient who was initially admitted for septic shock. Although she was treated aggressively with broad spectrum antibiotics, unfortunately the gangrene eventually led to bilateral lower extremity amputation. Therefore, it is critical to recognize this disorder early and provide immediate management. Ischemic limb gangrene with pulses can result from DIC, calciphylaxis, and atheroembolism [1, 2]. In our case, the focal facial skin infection was very likely the cause of the toxic shock syndrome (TSS) and the resultant DIC, which subsequently led to shock, microvascular thrombi in various organs, retiform purpura, and dry gangrene in the limbs [3, 4]. Furthermore, the vasoconstriction due to multiple vasopressors may have aggravated the development of ischemic necrosis and limb gangrene [5].

In cases of ischemic limb gangrene, the existence of pulse should be determined first, and subsequent evaluation should assess the occurrence of DIC [2]. Furthermore, the early recognition of microthrombosis-associated ischemic injury can be facilitated by two clinical signs. One is the presence of retiform purpura, which is purpuric instead of erythematous. The second sign is the absence of induced bleeding upon puncturing a purpuric skin area to 3–4 mm in depth [6].

CONCLUSION

Toxic shock syndrome (TSS) associated with focal infection can lead to disseminated intravascular coagulopathy (DIC) and ischemic limb gangrene with pulses. Recognition of early signs and prompt treatment of the underlying disease and complications may help prevent severe consequences such as ischemic limb gangrene and amputation.

Keywords: Limb gangrene, Retiform purpura, Skin punch biopsy, Toxic shock syndrome

Edorium Journals: An introduction

Edorium Journals Team

About Edorium Journals
Edorium Journals is a publisher of high-quality, open access, international scholarly journals covering subjects in basic sciences and clinical specialties and subspecialties.

Invitation for article submission
We sincerely invite you to submit your valuable research for publication to Edorium Journals.

But why should you publish with Edorium Journals?
In less than 10 words - we give you what no one does.

Vision of being the best
We have the vision of making our journals the best and the most authoritative journals in their respective specialties. We are working towards this goal every day of every week of every month of every year.

Exceptional services
We care for you, your work and your time. Our efficient, personalized and courteous services are a testimony to this.

Editorial Review
All manuscripts submitted to Edorium Journals undergo pre-processing review, first editorial review, peer review, second editorial review and finally third editorial review.

Peer Review
All manuscripts submitted to Edorium Journals undergo anonymous, double-blind, external peer review.

Early View version
Early View version of your manuscript will be published in the journal within 72 hours of final acceptance.

Manuscript status
From submission to publication of your article you will get regular updates (minimum six times) about status of your manuscripts directly in your email.

Our Commitment

Six weeks
You will get first decision on your manuscript within six weeks (42 days) of submission. If we fail to honor this by even one day, we will publish your manuscript free of charge.*

Four weeks
After we receive page proofs, your manuscript will be published in the journal within four weeks (31 days). If we fail to honor this by even one day, we will publish your manuscript free of charge and refund you the full article publication charges you paid for your manuscript.*

Favored Author program
One email is all it takes to become our favored author. You will not only get fee waivers but also get information and insights about scholarly publishing.

Institutional Membership program
Join our Institutional Memberships program and help scholars from your institute make their research accessible to all and save thousands of dollars in fees make their research accessible to all.

Our presence
We have some of the best designed publication formats. Our websites are very user friendly and enable you to do your work very easily with no hassle.

Something more...
We request you to have a look at our website to know more about us and our services.

* Terms and condition apply. Please see Edorium Journals website for more information.

We welcome you to interact with us, share with us, join us and of course publish with us.
