Received 17 August, 2015; Accepted 2 September, 2015

Medicinal plants are potential sources of natural compounds with biological activities, and therefore attract the attention of researchers worldwide. The objective of this research is to determine the chemical composition of methanolic seed extract. The phytochemical compound screened by spectroscopy and gas chromatography-mass spectrometry (GC-MS) method. Sixteen bioactive phytochemical compounds were identified in the methanolic extract of *Origanum vulgare*. The identification of phytochemical compounds is based on the peak area, retention time molecular weight, molecular formula, MS Fragment- ions and pharmacological actions. GC-MS analysis of *O. vulgare* revealed the existence of the 1,7-Dioxaspiro[5,5]undec-2-ene, 2,4-Dihydroxy-2,5-dimethyl-39(2H)-furan-3-one, 2,4-Difurobenzene, 1-benzyloxy, α-D-Glucopyranoside, O-α-Glucopyranosyl, 4-Hexenal, 6-hydroxy-4-methyl, dimethyl acetal, acetate, 4H-pyran-4-one,2,3, dihydro-3,5-dihydroxy-6-methyl, Benzofuran, 4-Amino-1,5-pentandiolic acid, 2-Methoxy-4-vinylphenol, d-Mannose, 7-Isopropyl-10-methyl-1-oxo-1,5-dithia-spiro[5,5]undecane-2-carboxy, Phytol, Cis-Vaccenic acid, N-Methyl-Nbenzyltetradecanamine, 3,8,8-Trimethoxy-3-piperidyl-2,2-binaphthalene-1,1,4,4-tetrone, and 17-(1,5-Dimethylhexyl)10,13-dimethyl. The FTIR analysis of *O. vulgare* seeds proved the presence of alkenes, aliphatic fluoro compounds, alcohols, ethers, carboxlic acids, esters and hydrogen bonded alcohols, phenols.

**Key words:** GC/MS, bioactive compounds, FT-IR, *O. vulgare*.

**INTRODUCTION**

*Origanum vulgare* L. is a perennial aromatic herb belonging to the family *Lamiaceae* (Skoula and Harborne, 2002) used for thousands of years as spices and as local medicines in traditional medicine (Altameeme et al., 2015). *O. vulgare* L. is the most wide spread among all the species within the genus. It is distributed all over Europe, West and Central Asia up to Taiwan (Ietswaart, 1980; Hameed et al., 2015).

Aerial flowering parts of *O. vulgare* subsp. *viride* are used in Iranian traditional medicine as diuretic, stomachic, antineuralgic, antitussive and expectorant (Afsharypuor et al. 1997). *O. vulgare* plays a primary role
among culinary herbs in world trade (Oliver, 1997). Taxonomic studies on the basis of morphological characters have led to the discrimination of several subspecies. Ietswaart (1980), distinguished six subspecies of *O. vulgare*, that is, *hirtum*, *vulgare*, *virens*, *viride*, *gracile* and *glandulosum*. Only *O. vulgare* L. subspecies *hirtum* has the leaf anatomy which corresponds to that of commercially marketed European oregano (Skoula and Harborne, 2002).

Oregano is used worldwide both as spice and crude drug, which is mainly provided by species of *Origanum* genus (Franz and Novak, 2002). Oregano was found to be strong antimicrobial agent and had a significant spasmylocytic effect on smooth muscle (Hameed et al., 2015). The fumigant toxicity and insecticidal effect of oregano essential oils for storeroom insects has also been proved (Marn et al., 1999; Imad et al., 2015). Many herbs are commonly used in home-type cure therapies, complementary medicine and modern medicine because of their perceived antioxidant, antimicrobial, anticancer, etc. properties. *Origanum* species are counted among these herbs, since they show high activities according to their assessment for the above biological properties (Mechergui et al., 2010; Hussein et al., 2015). A remarkable phytocompound morphology with several chemotypes is also reported by several studies on this species that shows marked spatial segregation in nature (D’antuono et al., 2000; Radušiene et al., 2005; Hameed et al., 2015c).

Furthermore, *O. vulgare* has an antioxidant property and is applied in human health. Cervato et al. (2000), prove that the antioxidant activities of extracts of oregano’s leaves (both aqueous and methanolic extracts) can inhibit all phases of lipid peroxidative process (Sahin et al., 2004; Singh, 2007; Hussein et al., 2015). The biological activity of essential oils and herb extracts cause a high pharmaceutical and industrial interest in *O. vulgare*, since antimicrobial, antifungal, insecticidal and antioxidative effects have been reported (Kulisic et al., 2004; Bakkali et al. 2008; et al., 2015). *Origanum* tea is a treatment for indigestion, coughs, and to stimulate menstruation. The oil of *Origanum* is used for toothache, and in some cosmetics. Its leaves and flowering stems are natural antiseptics because of high thymol content (Bhat et al., 2002; Singh, 2003; Dalpe, 2004; Bilalis et al., 2011).

The study, aim to study the analysis of chemical compounds of *Origanum vulgare* seeds by fourier-transform infrared (FT-IR) spectroscopy and gas chromatography-mass spectrometry (GC-MS).

**MATERIALS AND METHODS**

**Collection and preparation of plant material**

The seeds were dried at room temperature for two weeks, and when properly dried then powdered using clean pestle and mortar, and the powdered plant was size reduced with a sieve. The fine powder was then packed in airtight container to avoid the effect of humidity and then stored at room temperature. About thirteen grams of the plant sample powdered were soaked in 100 ml methanol individually. It was left for 96 h so that alkaloids, flavonoids and other constituents if present will get dissolved. The methanol extract was filtered using Whatman No.1 filter paper and the residue was removed (Jasim et al., 2015).

**Gas chromatography – mass spectrometry analysis**

The GC-MS analysis of the plant extract was made in a (Agilent 7890 A) instrument under computer control at 70 eV. About 1μL of the methanol extract was injected into the GC-MS using a micro syringe and the scanning was done for 45 min (Imad et al., 2014a). As the compounds were separated, they eluted from the column and entered a detector which was capable of creating an electronic signal whenever a compound was detected. The greater the concentration in the sample, bigger was the signal obtained which was then processed by a computer. The time from when the injection was made (Initial time) to when elution occurred is referred to as the Retention time (RT). While the instrument was run, the computer generated a graph from the signal called Chromatogram. Each of the peaks in the chromatogram represented the signal created when a compound eluted from the Gas chromatography column into the detector. The X-axis showed the RT and the Y-axis measured the intensity of the signal to quantify the component in the sample injected. As individual compounds eluted from the gas chromatographic column, they entered the electron ionization (mass spectrometry) detector, where they were bombarded with a stream of electrons causing them to break apart into fragments (Mohammed and Imad, 2013; Imad et al 2014b; Kareem et al., 2015).

The fragments obtained were actually charged ions with a certain mass. The M/Z (Mass / Charge ) ratio obtained was calibrated from the graph obtained, which was called as the Mass spectrum graph which is the fingerprint of a molecule. Before analyzing the extract using gas chromatography and mass spectroscopy, the temperature of the oven, the flow rate of the gas used and the electron gun were programmed initially. The temperature of the oven was maintained at 100°C. Helium gas was used as a carrier as well as an eluent. The flow rate of helium was set to 1 ml per min. The electron gun of mass detector liberated electrons having energy of about 70eV. The column employed here for the separation of components was Elite 1(100% dimethyl poly siloxane). The identity of the components in the extracts was assigned by the comparison of their retention indices and mass spectra fragmentation patterns with those stored on the computer library and also with published literatures. Compounds were identified by comparing their spectra to those of the Wiley and NIST/EPA/NIH mass spectral libraries (Imad et al., 2014c; Muhanned et al., 2015).

**RESULTS AND DISCUSSION**

Gas chromatography and mass spectroscopy analysis of compounds was carried out in methanolic seeds extract of *O. vulgare*, shown in Table 1. The GC-MS chromatogram of the 16 peaks of the compounds detected was shown in Figure 1. Chromatogram GC-MS analysis of the methanol extract of *O. vulgare* showed the presence of sixteen major peaks and the components corresponding to the peaks were determined as follows. The first set up peak were determined to be 1,7-Dioxaspiro[5,5]undec-2-ene Figure 2. The second peak

**CONCLUSION**

*O. vulgare* is native plant of Iraq. It contain chemical constitutions which may be useful for various herbal formulation as anti-inflammatory, analgesic, antipyretic, cardiac tonic and antiasthmatic.

**ACKNOWLEDGMENTS**

The authors wish to express their deepest gratitude to Prof. Dr. Adul-Kareem for his valuable contributions and support throughout this study. They would also like to express their gratitude to Dr. Ali Al-Marzuki for his valuable suggestions and comments.

**Conflict of interest**

Authors have none to declare
