AN ADDENDUM TO KREIN’S FORMULA

FRITZ GESZTESY, KONSTANTIN A. MAKAROV, EDUARD TSEKANOVSKII

Abstract. We provide additional results in connection with Krein’s formula, which describes the resolvent difference of two self-adjoint extensions $A_1$ and $A_2$ of a densely defined closed symmetric linear operator $\hat{A}$ with deficiency indices $(n, n)$, $n \in \mathbb{N} \cup \{\infty\}$. In particular, we explicitly derive the linear fractional transformation relating the operator-valued Weyl-Titchmarsh $M$-functions $M_1(z)$ and $M_2(z)$ corresponding to $A_1$ and $A_2$.

The purpose of this note is to derive some elementary but useful consequences of Krein’s formula, which appear to have escaped notice in the literature thus far. We start with the basic setup following a short note of Saakjan [20]. This paper is virtually unknown in the western hemisphere, and to the best of our knowledge, no English translation of it seems to exist. Since the paper contains few details, we provide some proofs of the basic facts used in [20].

Let $\mathcal{H}$ be a complex separable Hilbert space with scalar product $(\cdot, \cdot)$ (linear in the second factor), denote the identity operator in $\mathcal{H}$ by $I$, abbreviate the restriction $I\big|_{\mathcal{N}}$ of $I$ to a closed subspace $\mathcal{N}$ of $\mathcal{H}$ by $I\mathcal{N}$, and let $B(\mathcal{H})$ be the Banach space of bounded linear operators on $\mathcal{H}$. Let $\hat{A} : \mathcal{D}(\hat{A}) \to \mathcal{H}$, $\mathcal{D}(\hat{A}) = \mathcal{H}$ be a densely defined closed symmetric linear operator in $\mathcal{H}$ with equal deficiency indices $\text{def} (\hat{A}) = (n, n)$, $n \in \mathbb{N} \cup \{\infty\}$. We denote by $\mathcal{N}_\pm$ the deficiency subspaces of $\hat{A}$, that is,

$$\mathcal{N}_\pm = \ker(\hat{A}^* \mp i).$$

For any self-adjoint extension $A$ of $\hat{A}$ we introduce its unitary Cayley transform $C_A$ by

$$C_A = (A + i)(A - i)^{-1}.$$  

In addition, we call two self-adjoint self-adjoint extensions $A_1$ and $A_2$ of $\hat{A}$ relatively prime if $\mathcal{D}(A_1) \cap \mathcal{D}(A_2) = \mathcal{D}(\hat{A})$. (In this case we shall also write that $A_1$ and $A_2$ are relatively prime w.r.t. $\hat{A}$). The point spectrum (i.e., the set of eigenvalues) and the resolvent set of a linear operator $T$ in $\mathcal{H}$ are abbreviated by $\sigma_p(T)$ and $\rho(T)$, respectively, and the direct sum of two linear subspaces $V$ and $W$ of $\mathcal{H}$ is denoted by $V \dot{+} W$ in the following.

Lemma 1. Let $A$, $A_1$, and $A_2$ be self-adjoint extensions of $\hat{A}$. Then

(i). The Cayley transform of $A$ maps $\mathcal{N}_-$ onto $\mathcal{N}_+$

$$C_A\mathcal{N}_- = \mathcal{N}_+.$$  

(ii). $\mathcal{D}(A) = \mathcal{D}(\hat{A}) \dot{+} (I - C_A^{-1})\mathcal{N}_+.$

(iii). For $f_+ \in \mathcal{N}_+$, $(A - i)^{-1}C_A^{-1}f_+ = (i/2)(C_A^{-1} - I)f_+.$

(iv). $\mathcal{N}_+$ is an invariant subspace for $C_{A_1}^{-1}C_{A_2}^{-1}$ and $C_{A_2}C_{A_1}^{-1}$. In addition, $A_1$ and $A_2$ are relatively prime if and only if
\[ 1 \notin \sigma_p(C_{A_1}^{-1}C_{A_2}^{-1}|_{\mathcal{N}_+}). \]

(v). Suppose $A_1$ and $A_2$ are relatively prime w.r.t. $\hat{A}$. Then
\[ \text{ran}((A_2 - i)^{-1} - (A_1 - i)^{-1}) = \mathcal{N}_+, \]
\[ \ker(((A_2 - i)^{-1} - (A_1 - i)^{-1})|_{\mathcal{N}_-}) = \{0\}. \]

**Proof.** Since the facts are standard we only sketch the main steps.

(i). Pick $g \in \mathcal{D}(\hat{A})$, $f = (\hat{A} - i)g$, then $C_Af = (\hat{A} + i)g \in \text{ran}(\hat{A} + i)$ yields $C_A\text{ran}(\hat{A} - i) \subseteq \text{ran}(\hat{A} + i)$. Similarly one infers $C_A^{-1}\text{ran}(\hat{A} + i) \subseteq \text{ran}(\hat{A} - i)$ and hence $C_A\text{ran}(\hat{A} - i) = \text{ran}(\hat{A} + i)$. Since $C_A \in \mathcal{B}(\mathcal{H})$ (in fact, $C_A$ is unitary), $C_A\text{ran}(\hat{A} - i) = \text{ran}(\hat{A} + i)$. $\mathcal{H} = \text{ker}(\hat{A}^* - i) \oplus \text{ran}(\hat{A} + i)$ then yields $C_A\mathcal{N}_- = \mathcal{N}_+$.

(ii). By von Neumann’s formula [18],
\[ \mathcal{D}(A) = \mathcal{D}(\hat{A}) + \mathcal{N}_+ + \mathcal{U}_A\mathcal{N}_+. \]
for some linear isometric isomorphism $U_A : \mathcal{N}_+ \to \mathcal{N}_-$. Since $I - C_A^{-1} = 2i(A + i)^{-1}$, $(I - C_A^{-1})\mathcal{N}_+ = 2i(A + i)^{-1}\mathcal{N}_+ \subseteq \mathcal{D}(A)$, one concludes
\[ \mathcal{U}_A = -C_A^{-1}|_{\mathcal{N}_+}. \]

(iii). $(i/2)(I - C_A^{-1})f_+ \in \mathcal{D}(A)$ and
\[ (i/2)(A - i)(I - C_A^{-1})f_+ = (i/2)(A - i)2i(A + i)^{-1}f_+ = -(A - i)(A + i)^{-1}f_+ = -C_A^{-1}f_+. \]

(iv). By (i), $\mathcal{N}_+$ is an invariant subspace for the unitary operators $C_{A_1}^{-1}C_{A_2}^{-1}$ and $C_{A_2}C_{A_1}^{-1}$. To complete the proof of (i) it suffices to note that
\[ 1 \in \sigma_p(C_{A_1}C_{A_2}^{-1}|_{\mathcal{N}_+}) \iff \exists 0 \neq f_+ \in \mathcal{N}_+: C_{A_1}^{-1}f_+ = C_{A_2}^{-1}f_+ \]
\[ \iff (I - C_A^{-1})f_+ = (I - C_A^{-1})f_+ \in \mathcal{D}(A_1) \cap \mathcal{D}(A_2) \]
by the proof of (iii)) and $(I - C_A^{-1})f_+ \notin \mathcal{D}(\hat{A})$ (by (ii)) yields a contradiction to $A_1$ and $A_2$ being relatively prime w.r.t. $\hat{A}$.

(v). Let $g \in \mathcal{D}(\hat{A})$, $f = (\hat{A} + i)g$, then
\[ (f, ((A_2 - i)^{-1} - (A_1 - i)^{-1})h) = (((A_2 + i)^{-1} - (A_1 + i)^{-1})(\hat{A} + i)g, h) = 0, \]
\[ h \in \mathcal{H} \]
yields
\[ \text{ran}((A_2 - i)^{-1} - (A_1 - i)^{-1}) \subseteq \text{ran}(\hat{A} + i)^\perp = \text{ker}(\hat{A}^* - i) = \mathcal{N}_+. \]
Next, let $0 \neq f_+ \in \mathcal{N}_+$ and $f_+ \perp \text{ran}((A_2 - i)^{-1} - (A_1 - i)^{-1})$. In particular,
\[ f_+ \perp ((A_2 - i)^{-1} - (A_1 - i)^{-1})C_{A_1}^{-1}f_+. \]
By (iii), $(A_1 - i)^{-1}C_{A_1}^{-1}f_+ = -(i/2)(I - C_{A_1}^{-1})f_+$ and
\[ (A_2 - i)^{-1}C_{A_1}^{-1}f_+ = (A_2 - i)^{-1}C_{A_2}C_{A_1}^{-1}(A_2 - i)^{-1}C_{A_1}^{-1}f_+ = -(i/2)(I - C_{A_1}^{-1})(C_{A_2}C_{A_1}^{-1}f_+ \]
\[ = -(i/2)(C_{A_2}C_{A_1}^{-1} - C_{A_1}^{-1})f_+, \]
and hence
\[ ((A_2 - i)^{-1} - (A_1 - i)^{-1})C_{A_1}^{-1}f_+ = -(i/2)(C_{A_2}C_{A_1}^{-1} - I)f_+. \]
Thus, \( f_+ \perp (\mathcal{A}_2 \mathcal{A}_1^{-1} - I)f_+ \), that is,
\[
(f_+, \mathcal{A}_2 \mathcal{A}_1^{-1}f_+) = ||f_+||^2.
\] (15)
Since \( \mathcal{A}_2 \mathcal{A}_1^{-1}|_{\mathcal{N}_+} \) is unitary, one concludes \( \mathcal{A}_2 \mathcal{A}_1^{-1}f_+ = f_+ = \mathcal{A}_1 \mathcal{A}_2^{-1}f_+ \) and hence
\[
1 \in \sigma_{\rho}(\mathcal{A}_1 \mathcal{A}_2^{-1}|_{\mathcal{N}_+}).
\] (16)
But (16) contradicts the hypothesis that \( A_1 \) and \( A_2 \) are relatively prime w.r.t. \( \hat{A} \).
Consequently, \( \operatorname{ran}((A_2 - i)^{-1} - \operatorname{ran}((A_1 - i)^{-1})) = \mathcal{N}_+ \), which is \( \{0\} \).

To prove (8) we note that every \( f_- \in \mathcal{N}_- \) is of the form \( f_- = \mathcal{A}_1^{-1}f_+ \) for some \( f_+ \in \mathcal{N}_+ \) using (i). Suppose \((A_2 - i)^{-1} - (A_1 - i)^{-1})\mathcal{A}_2^{-1}f_+ = 0 \). By \( (14) \), this yields \( \mathcal{A}_1 \mathcal{A}_2^{-1}f_+ = f_+ \) and hence \( 1 \in \sigma_{\rho}(\mathcal{A}_1 \mathcal{A}_2^{-1}|_{\mathcal{N}_+}) \). Since \( A_1 \) and \( A_2 \) are relatively prime w.r.t. \( \hat{A} \) one concludes \( f_- = \mathcal{A}_1^{-1}f_+ = 0 \).

\[\square\]

Next, assuming \( A_\ell, \ell = 1, 2 \) to be self-adjoint extensions of \( \hat{A} \), define
\[
P_{1,2}(z) = (A_1 - z)(A_1 - i)^{-1}((A_2 - z)^{-1} - (A_1 - z)^{-1})(A_1 - z)(A_1 + i)^{-1},
\] (17)
\[z \in \rho(A_1) \cap \rho(A_2)\] .

We collect the following properties of \( P_{1,2}(z) \).

**Lemma 2.** Let \( z, z' \in \rho(A_1) \cap \rho(A_2) \).

(i). \( P_{1,2} : \rho(A_1) \cap \rho(A_2) \rightarrow \mathcal{B}(\mathcal{H}) \) is analytic and
\[
P_{1,2}(z)^* = P_{1,2}(\bar{z}).
\] (18)

(ii).
\[
P_{1,2}(z)|_{\mathcal{N}_+} = 0, \quad P_{1,2}(z)|_{\mathcal{N}_+} \subseteq \mathcal{N}_+.
\] (19)

(iii).
\[
P_{1,2}(z) = P_{1,2}(z') + (z - z')P_{1,2}(z')(A_1 + i)(A_1 - z')^{-1}(A_1 - z)^{-1}P_{1,2}(z).
\] (20)

(iv). \( \operatorname{ran}(P_{1,2}(z)|_{\mathcal{N}_+}) \) is independent of \( z \in \rho(A_1) \cap \rho(A_2) \).

(v). Assume \( A_1 \) and \( A_2 \) are relatively prime self-adjoint extensions of \( \hat{A} \). Then \( P_{1,2}(z)|_{\mathcal{N}_+} : \mathcal{N}_+ \rightarrow \mathcal{N}_+ \) is invertible (i.e., one-to-one).

(vi). Assume \( A_1 \) and \( A_2 \) are relatively prime self-adjoint extensions of \( \hat{A} \). Then
\[
\operatorname{ran}(P_{1,2}(i)) = \mathcal{N}_+.
\] (21)

(vii).
\[
P_{1,2}(i)|_{\mathcal{N}_+} = (i/2)(I - \mathcal{A}_2 \mathcal{A}_1^{-1})|_{\mathcal{N}_+}.
\] (22)

Next, let
\[
\mathcal{A}_2 \mathcal{A}_1^{-1}|_{\mathcal{N}_+} = -e^{-2i\alpha_{1,2}}
\] (23)
for some self-adjoint (possibly unbounded) operator \( \alpha_{1,2} \) in \( \mathcal{N}_+ \). If \( A_1 \) and \( A_2 \) are relatively prime, then
\[
\{(m + \frac{1}{2})\pi\}_{m \in \mathbb{Z}} \cap \sigma_{\rho}(\alpha_{1,2}) = \emptyset
\] (24)
and
\[
(P_{1,2}(i)|_{\mathcal{N}_+})^{-1} = \tan(\alpha_{1,2}) - iI_{\mathcal{N}_+}.
\] (25)
In addition, \( \tan(\alpha_{1,2}) \in \mathcal{B}(\mathcal{N}_+) \) if and only if \( \text{ran}(P_{1,2}(i)) = \mathcal{N}_+ \).

Proof. (i) is clear from (17).

(ii). Let \( f \in \mathcal{D}(\hat{A}), \ g = (\hat{A} + i)f \). Then

\[
P_{1,2}(z)g = (A_1 - z)(A_1 - i)^{-1}((A_2 - z)^{-1} - (A_1 - z)^{-1})(\hat{A} - z)f = 0
\]  

(26)
yields \( P_{1,2}(z)|_{\text{ran}(\hat{A} + i)} = 0 \) and hence \( P_{1,2}(z)|_{\text{ran}(\hat{A} + i)} = P_{1,2}(z)|_{\mathcal{N}_+} = 0 \) since

\[
P_{1,2}(z) \in \mathcal{B}(\mathcal{H}).
\]

Moreover, by (17)

\[
\text{ran}(P_{1,2}(z)) \subseteq (A_1 - z)(A_1 - i)^{-1}\ker(\hat{A}^* - z) \subseteq \ker(\hat{A}^* - i) = \mathcal{N}_+
\]  

(27)
since

\[
(\hat{A}^* - i)(A_1 - z)(A_1 - i)^{-1}|_{\ker(\hat{A}^* - z)}
\]

\[
= (\hat{A}^* - i)(I - (z - i)(A_1 - i)^{-1})|_{\ker(\hat{A}^* - z)}
\]

\[
= ((z - i)I - (z - i)(\hat{A}^* - i)(A_1 - i)^{-1})|_{\ker(\hat{A}^* - z)} = 0.
\]  

(28)
This proves (13).

(iii). (28) is a straightforward (though tedious) computation using (17).

(iv). By (20), \( \text{ran}(P_{1,2}(z)|_{\mathcal{N}_+}) \subseteq \text{ran}(P_{1,2}(z')|_{\mathcal{N}_+}) \). By symmetry in \( z \) and \( z' \),

\[
\text{ran}(P_{1,2}(z)|_{\mathcal{N}_+}) = \text{ran}(P_{1,2}(z')|_{\mathcal{N}_+})
\]  

(29)
is independent of \( z \in \rho(A_1) \cap \rho(A_2) \).

(v). Since

\[
P_{1,2}(i) = ((A_2 - i)^{-1} - (A_1 - i)^{-1})C^{-1}_{A_1},
\]  

(30)
\( C^{-1}_{A_1} : \mathcal{N}_+ \to \mathcal{N}_- \) is isometric, \( \ker((A_2 - i)^{-1} - (A_1 - i)^{-1})|_{\mathcal{N}_+} = \{0\} \) by (1), one infers \( \ker((P_{1,2}(i)|_{\mathcal{N}_+}) = \{0\} \). Taking \( z' = i \) in (20) yields \( \ker(P_{1,2}(z)|_{\mathcal{N}_+}) = \{0\} \), that is, \( P_{1,2}(z)|_{\mathcal{N}_+} \) is invertible.

(vi). Since \( \text{ran}((A_2 - i)^{-1} - (A_1 - i)^{-1}) = \mathcal{N}_+ \) by (1) and \( C^{-1}_{A_1} : \mathcal{H} \to \mathcal{H} \) is unitary, (29) implies (22).

(vii). (22) follows from (24) and (20). (24) is a consequence of (1), and (23) follows from the elementary trigonometric identity \( (i/2)(1 + e^{-2ix}) = (\tan(x) - i)^{-1} \). By (25) and (21) \( \text{ran}(P_{1,2}(i)) = \mathcal{D}(\tan(\alpha_{1,2})) \) is dense in \( \mathcal{N}_+ \) and hence \( \tan(\alpha_{1,2}) \in \mathcal{B}(\mathcal{N}_+) \) if and only if \( \text{ran}(P_{1,2}(i)) = \mathcal{N}_+ \).

Next, we turn to the definition of Weyl-Titchmarsh operators associated with self-adjoint extensions of \( A \).

**Definition 3.**

Let \( A \) be a self-adjoint extension of \( \hat{A}, \mathcal{N} \subseteq \mathcal{N}_+ \) a closed linear subspace of \( \mathcal{N}_+ = \ker(\hat{A}^* - i) \), and \( z \in \rho(A) \). Then the Weyl-Titchmarsh operator \( M_{A,N}(z) \in \mathcal{B}(\mathcal{N}) \) associated with the pair \( (A,\mathcal{N}) \) is defined by

\[
M_{A,N}(z) = P_N(zA + I)(A - z)^{-1}P_N|_{\mathcal{N}} = zI_{\mathcal{N}} + (1 + z^2)P_N(A - z)^{-1}P_N|_{\mathcal{N}},
\]  

(31)
with \( P_N \) the orthogonal projection in \( \mathcal{H} \) onto \( \mathcal{N} \).
Weyl-Titchmarsh $m$-functions of the type (31) have attracted a lot of interest since their introduction by Weyl [23] in the context of second-order ordinary differential operators and their function-theoretic study initiated by Titchmarsh [24]. Subsequently, Krein introduced the concept of $Q$-functions, the appropriate generalization of the scalar Weyl-Titchmarsh $m$-function, and he and his school launched a systematic investigation of $Q$. The literature on $Q$-functions is too extensive to be discussed exhaustively in this note. We refer, for instance, to [10], [11], [12], [13], [14], [15], [20] and the literature therein. Saakjan [20] considers a $Q$-function of the type (31) in the general case where $\text{def}(\hat{A}) = (n, n)$, $n \in \mathbb{N} \cup \{\infty\}$. The special case $\text{def}(\hat{A}) = (1, 1)$ was also discussed by Donoghue [3], who apparently was unaware of Krein’s work in this context. For a recent treatment of operator-valued $m$-functions we also refer to Derkach and Malamud [4], [5] and the extensive bibliography therein.

**Lemma 4.** [20] Let $A_\ell$, $\ell = 1, 2$ be relatively prime self-adjoint extensions of $\hat{A}$. Then

\[
(P_{1,2}(z)|_{N_+})^{-1} = (P_{1,2}(i)|_{N_+})^{-1} - (z - i)P_{N_+}(A_1 + i)(A_1 - z)^{-1}P_{N_+} \quad (32)
\]

\[
= \tan(\alpha_{1,2}) - M_{A_1,N_+}(z), \; z \in \rho(A_1). \quad (33)
\]

**Proof.** By Lemma 2(v), $P_{1,2}(z)|_{N_+}$ is invertible for $z \in \rho(A_1) \cap \rho(A_2)$ and hence (32) follows from (29) and extends by continuity to all $z \in \rho(A_1))$. Equation (33) is then clear from (29) and (31). \[\square\]

Given Lemmas 1, 2, and 4 we can summarize Saakjans’s results on Krein’s formula as follows.

**Theorem 5.** [20] Let $A_1$ and $A_2$ be self-adjoint extensions of $\hat{A}$ and $z \in \rho(A_1) \cap \rho(A_2)$. Then

\[
(A_2 - z)^{-1} = (A_1 - z)^{-1} + (A_1 - i)(A_1 - z)^{-1}P_{1,2}(z)(A_1 + i)^{-1}(A_1 - z)^{-1} \quad (34)
\]

\[
= (A_1 - z)^{-1} + (A_1 - i)(A_1 - z)^{-1}P_{N_1,2,+} \times (\tan(\alpha_{N_1,2,+}) - M_{A_1,N_1,2,+}(z))^{-1}P_{N_1,2,+}(A_1 + i)(A_1 - z)^{-1}, \quad (35)
\]

where

\[
N_1,2,+ = \ker((A_1|_{D(A_1) \cap D(A_2)})^* - i) \quad (36)
\]

and

\[
e^{-2i\alpha_{N_1,2,+}} = -C_{A_2}C_{A_1}|_{N_1,2,+}. \quad (37)
\]

**Proof.** If $A_1$ and $A_2$ are relatively prime w.r.t. $\hat{A}$, Lemmas 1, 2 and 4 prove (34)–(37). If $A_1$ and $A_2$ are arbitrary self-adjoint extensions of $\hat{A}$ one replaces $\hat{A}$ by the largest common symmetric part of $A_1$ and $A_2$ given by $A_1|_{D(A_1) \cap D(A_2)}$. \[\square\]

Apparently, Krein’s formula (34), (35) was first derived independently by Krein [10] and Naimark [17] in the special case $\text{def}(\hat{A}) = (1, 1)$. The case $\text{def}(\hat{A}) = (n, n)$, $n \in \mathbb{N}$ is due to Krein [11]. A proof for this case can also be found in the classic monograph by Akhiezer and Glazman [1], Sect. 84. Saakjan [20] extended Krein’s formula to the general case $\text{def}(\hat{A}) = (n, n)$, $n \in \mathbb{N} \cup \{\infty\}$. In another form, the generalized resolvent formula for symmetric operators (including the case of non-densely defined operators) has been obtained by Strauss [21], [22]. For a variety of
further results and extensions of Krein’s formula we refer, for instance, to [8], [9], [14], [15], [23], and the literature therein.

Saakjan [20] makes no explicit attempt to relate Krein’s formula and von Neumann’s parametrization [18] of self-adjoint extensions of $\hat{A}$ (or $A_1\big|_{D(A_1)\cap D(A_2)}$).

This connection, however, easily follows from the preceding formalism:

**Corollary 6.**

$$P_{1,2}(i)|_{\mathcal{N}_1,2,+} = (i/2)(I - U_{A_2}^{-1}U_{A_1})|_{\mathcal{N}_1,2,+},$$

where

$$U_{A_\ell} = -C_{A_\ell}^{-1}|_{\mathcal{N}_+}, \quad \ell = 1, 2 \quad (39)$$

denotes the linear isometric isomorphism from $\mathcal{N}_+$ onto $\mathcal{N}_-$ parametrizing the self-adjoint extensions $A_\ell$ of $\hat{A}$.

**Proof.** Combine (7), (8), and (22).

Krein’s formula has been used in a large variety of problems in mathematical physics as can be inferred from the extensive number of references provided, for instance, in [2]. (A complete bibliography on Krein’s formula is beyond the scope of this short note.)

Next, we observe that $M_{A,N}(z)$ and hence $-(P_{1,2}(z)|_{\mathcal{N}_+})^{-1}$ and $P_{1,2}(z)|_{\mathcal{N}_+}$ (cf. (33)) are operator-valued Herglotz functions. More precisely, denoting $\text{Re}(T) = (T + T^*)/2$, $\text{Im}(T) = (T - T^*)/2i$ for linear operators $T$ with $D(T) = D(T^*)$ in some Hilbert space $\mathcal{K}$, one can prove the following result.

**Lemma 7.** Let $\hat{A}$ be a self-adjoint extension of $\hat{A}$, $\mathcal{N}$ a closed subspace of $\mathcal{N}_+$. Then the Weyl-Titchmarsh operator $M_{A,N}(z)$ is analytic for $z \in \mathbb{C} \setminus \mathbb{R}$ and

$$\text{Im}(z)\text{Im}(M_{A,N}(z)) \geq (\max(1, |z|^2) + |\text{Re}(z)|)^{-1}, \quad z \in \mathbb{C} \setminus \mathbb{R}. \quad (40)$$

In particular, $M_{A,N}(z)$ is a $\mathcal{B}(\mathcal{N})$-valued Herglotz function.

**Proof.** Using (31), an explicit computation yields

$$\text{Im}(z)\text{Im}(M_{A,N}(z)) = P_N(I + A^2)^{1/2}((A - \text{Re}(z))^2 + (\text{Im}(z))^2)^{-1} \times (I + A^2)^{1/2}P_N|_{\mathcal{N}}. \quad (41)$$

Next we note that for $z \in \mathbb{C} \setminus \mathbb{R}$,

$$\frac{1 + \lambda^2}{(\lambda - \text{Re}(z))^2 + (\text{Im}(z))^2} \geq \frac{1}{\max(1, |z|^2) + |\text{Re}(z)|}, \quad \lambda \in \mathbb{R}. \quad (42)$$

Since by the Rayleigh-Ritz technique, projection onto a subspace contained in the domain of a self-adjoint operator bounded from below can only rise the lower bound of the spectrum (cf. [19], Sect. XIII.1), [11] and [12] prove (40).

In the remainder of this note we shall explicitly derive the linear fractional transformation relating the Weyl-Titchmarsh operators $M_{A_\ell,\mathcal{N}_1,2,+}$ associated with two self-adjoint extensions $A_\ell$, $\ell = 1, 2$, of $\hat{A}$. For simplicity we first consider the case where $A_1$ and $A_2$ are relatively prime w.r.t. $\hat{A}$. 
Lemma 8. Suppose $A_1$ and $A_2$ are relatively prime self-adjoint extensions of $\hat{A}$ and $z \in \rho(A_1) \cap \rho(A_2)$. Then
\[
M_{A_2,N_+}(z) = (P_{1,2}(i)\big|_{N_+} + (I_{N_+} + iP_{1,2}(i)\big|_{N_+})M_{A_1,N_+}(z)) \\
\times ((I_{N_+} + iP_{1,2}(i)\big|_{N_+}) - P_{1,2}(i)\big|_{N_+}M_{A_1,N_+}(z))^{-1}
\]
(43)
where
\[
e^{-2i\alpha_{1,2}} = -C_{A_2}C_{A_1}^{-1}|_{N_+}.
\]
(45)

Proof. Using (33) and (35) one computes
\[
M_{A_2,N_+}(z) = (zI + (1 + z^2)P_{N_+}(A_2 - z)^{-1}P_{N_+})\big|_{N_+} \\
= M_{A_1,N_+}(z) + (1 + z^2)P_{N_+}(A_1 - i)(A_1 - z)^{-1}P_{N_+}(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1} \\
\times P_{N_+}(A_1 + i)(A_1 - z)^{-1}P_{N_+} \\
= M_{A_1,N_+}(z) + (iI_{N_+} + M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1} \\
\times (-iI_{N_+} + M_{A_1,N_+}(z)) \\
= M_{A_1,N_+}(z) + (iI_{N_+} + M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1} \\
\times (-iI_{N_+} + M_{A_1,N_+}(z) - \tan(\alpha_{1,2}) + \tan(\alpha_{1,2})) \\
= -iI_{N_+} + (iI_{N_+} + M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1}(-iI_{N_+} + \tan(\alpha_{1,2})) \\
= -i(-iI_{N_+} + \tan(\alpha_{1,2}))^{-1}(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1} \\
\times (-iI_{N_+} + \tan(\alpha_{1,2})) \\
+ (iI_{N_+} + M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1}(-iI_{N_+} + \tan(\alpha_{1,2})) \\
= (-iI_{N_+} + \tan(\alpha_{1,2}))^{-1}(-i\tan(\alpha_{1,2}) + iM_{A_1,N_+}(z) \\
\times (-iI_{N_+} + \tan(\alpha_{1,2}))(iI_{N_+} + M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1} \\
\times ((-iI_{N_+} + \tan(\alpha_{1,2})) \\
= (-iI_{N_+} + \tan(\alpha_{1,2}))^{-1}(I_{N_+} + \tan(\alpha_{1,2})M_{A_1,N_+}(z))(\tan(\alpha_{1,2}) - M_{A_1,N_+}(z))^{-1} \\
\times ((-iI_{N_+} + \tan(\alpha_{1,2})) = [44].
\]

Equation (43) then immediately follows from (44) since $P_{1,2}(i)\big|_{N_+} = (\tan(\alpha_{1,2}) - \\
\times (-iI_{N_+} + \tan(\alpha_{1,2}))^{-1}$ by (28).

Finally, we treat the case of general self-adjoint extensions of $\hat{A}$ and state the principal result of this note.

Theorem 9. Suppose $A_1$ and $A_2$ are self-adjoint extensions of $\hat{A}$ and $z \in \rho(A_1) \cap \rho(A_2)$. Then (43) still holds, that is,
\[
M_{A_2,N_+}(z) = (P_{1,2}(i)\big|_{N_+} + (I_{N_+} + iP_{1,2}(i)\big|_{N_+})M_{A_1,N_+}(z)) \\
\times ((I_{N_+} + iP_{1,2}(i)\big|_{N_+}) - P_{1,2}(i)\big|_{N_+}M_{A_1,N_+}(z))^{-1},
\]
(47)
where
\[
P_{1,2}(i)\big|_{N_+} = (i/2)(I - C_{A_2}C_{A_1}^{-1})\big|_{N_+},
I_{N_+} + P_{1,2}(i)\big|_{N_+} = (1/2)(I + C_{A_2}C_{A_1}^{-1})\big|_{N_+}.
\]
(48)
Proof. Choose a self-adjoint extension $A_3$ of $\hat{A}$ such that $(A_1, A_3)$ and $(A_2, A_3)$ are relatively prime w.r.t. $\hat{A}$. (Existence of $A_3$ is easily confirmed using the criterion (8)). Then express $M_{A_1,N_+}(z)$ in terms of $M_{A_3,N_+}(z)$ and an associated $\alpha_{3,1}$ according to (14) and (15) and similarly, express $M_{A_2,N_+}(z)$ in terms of $M_{A_3,N_+}(z)$ and some $\alpha_{3,2}$. One obtains,

$$M_{A_1,N_+}(z) = e^{-i\alpha_{3,1}}(\cos(\alpha_{3,1}) + \sin(\alpha_{3,1})M_{A_3,N_+}(z))$$

$$\times (\sin(\alpha_{3,1}) - \cos(\alpha_{3,1})M_{A_3,N_+}(z))^{-1}e^{i\alpha_{3,1}},$$

(49)

$$M_{A_2,N_+}(z) = e^{-i\alpha_{3,2}}(\cos(\alpha_{3,2}) + \sin(\alpha_{3,2})M_{A_3,N_+}(z))$$

$$\times (\sin(\alpha_{3,2}) - \cos(\alpha_{3,2})M_{A_3,N_+}(z))^{-1}e^{i\alpha_{3,2}}.$$ 

(50)

Computing $M_{A_2,N_+}(z)$ from (13) yields

$$M_{A_2,N_+}(z) = -e^{i\alpha_{3,1}}(\cos(\alpha_{3,1}) - \sin(\alpha_{3,1})M_{A_1,N_+}(z))$$

$$\times (\sin(\alpha_{3,1}) + \cos(\alpha_{3,1})M_{A_1,N_+}(z))^{-1}e^{-i\alpha_{3,1}}.$$ 

(51)

Insertion of (51) into (14) yields (47) taking into account (48).

Since the boundary values $\lim_{\varepsilon \downarrow 0}(f, M_{A_1,N_+}(\lambda + i\varepsilon)g)$ for $f, g \in N_+$ and a.e. $\lambda \in \mathbb{R}$ contain spectral information on the self-adjoint extension $A_1$ of $\hat{A}$, relations of the type (17) entail important connections between the spectra of $A_1$ and $A_2$. In particular, the well-known unitary equivalence of the absolutely continuous parts $A_{1,ac}$ and $A_{2,ac}$ of $A_1$ and $A_2$ in the case def($\hat{A}$) = $(n, n)$, $n \in \mathbb{N}$, can be inferred from (17) as discussed in detail in [8]. Moreover, in concrete applications to ordinary differential operators with matrix-valued coefficients, the choice of different self-adjoint boundary conditions associated with a given formally symmetric differential expression $\tau$ yields self-adjoint realizations of $\tau$ whose corresponding $W$-functions are related via linear fractional transformations of the type considered in Theorem [9].

Although it appears very unlikely that the explicit formula (17) has been missed in the extensive literature on self-adjoint extensions of symmetric operators of equal deficiency indices, we were not able to locate a pertinent reference. In the special case def($\hat{A}$) = $(1, 1)$, equations (14) and (17) are of course well-known and were studied in great detail by Aronszajn [3] and Donohue [4].

We conclude with a simple illustration.

**Example 10.** $\mathcal{H} = L^2((0, \infty); dx)$,

$$\hat{A} = -\frac{d^2}{dx^2},$$

$\mathcal{D}(\hat{A}) = \{g \in L^2((0, \infty); dx) \mid g, g' \in AC_{loc}((0, \infty)), g(+0) = g'(+0) = 0\},$

$$\mathcal{D}(\hat{A}) = \{g \in L^2((0, \infty); dx) \mid g, g' \in AC_{loc}((0, \infty)), g(0) = 0\},$$

$$A_1 = A_F = -\frac{d^2}{dx^2}, \quad \mathcal{D}(A_1) = \{g \in \mathcal{D}(\hat{A}) \mid g(+0) = 0\},$$

$$A_2 = -\frac{d^2}{dx^2}, \quad \mathcal{D}(A_2) = \{g \in \mathcal{D}(\hat{A}) \mid g(+0) + 2^{-1/2}(1 - \tan(\alpha_2))g(+0) = 0\},$$
where \( A_F \) denotes the Friedrichs extension of \( \hat{A} \) (corresponding to \( \alpha_2 = \pi/2 \)). One verifies,

\[
\ker(\hat{A}^* - z) = \{ ce^{i\sqrt{1-z}}, c \in \mathbb{C} \}, \quad \text{Im } (\sqrt{z}) > 0, \quad z \in \mathbb{C}\setminus[0, \infty), \quad \text{def}(\hat{A}) = (1, 1),
\]

\[
(A_2 - z)^{-1} = (A_1 - z)^{-1} - (2^{-1/2}(1 - \tan(\alpha_2)) + i\sqrt{\alpha_2})^{-1}(e^{i\sqrt{1-z}} - e^{i\sqrt{z}}),
\]

\[
z \in \rho(A_2), \quad \text{Im } (\sqrt{z}) > 0,
\]

\[
U_2^{-1}U_1 = -e^{-2i\alpha_2},
\]

\[
P_{1,2}(z) = -(1 - \tan(\alpha_2) + i\sqrt{2z})^{-1}, \quad z \in \rho(A_2), \quad P_{1,2}(i) = -\tan(\alpha_2) - i,
\]

\[
M_{A_1, \mathcal{N}^+}(z) = i\sqrt{2z} + 1, \quad M_{A_2, \mathcal{N}^+}(z) = \frac{\cos(\alpha_2) + \sin(\alpha_2)(i\sqrt{2z} + 1)}{\sin(\alpha_2) - \cos(\alpha_2)(i\sqrt{2z} + 1)}.
\]
