FIGURE S2. Geometric mean (SD) serum C-peptide concentration (ng/mL) over time. BAX-HI and NOVO-HI were infused over a 6.0-hour period with initial infusion at 0.0 hours, concurrent with an 8.0-hour euglycemic clamp procedure. Figure shows baseline C-peptide values 0.5 hours prior to insulin infusion, and consistent suppression of endogenous insulin throughout the euglycemic clamp procedure.
