Determinants of menstrual hygiene among the adolescent girls in a South Indian village

Swapna Budimelli, Kalyan Chebrolu*

ABSTRACT

Background: Adolescent girls constitute a vulnerable group, particularly in India where female child is neglected one. Menstruation is still regarded as something unclean or dirty in Indian society. Although menstruation is a natural process, it is linked with several misconceptions and practices, which sometimes result into adverse health outcomes. Women having better knowledge regarding menstrual hygiene and safe practices are less vulnerable to reproductive tract infections and its consequences. The objective of the present study is to determine the factors affecting the existing practices of menstrual hygiene among the adolescent girls and to study the beliefs, conception and source of information regarding menstruation among the study population.

Methods: A pre-tested semi-structured schedule containing information like socio-demographic factors, perceptions about menstruation, practice of menstrual hygiene, restrictions practiced during menstruation was administered to 200 adolescent girls by paying house to house visits. The data was entered in Microsoft Excel and analysed using Epi Info software version 7.2.3.

Results: Nearly three-fourths of the adolescent girls attained menarche before the age of 14 years and 87% had no knowledge about it prior to attaining menarche. Majority (86%) respondents use sanitary pads, while only 14% (7%) use new cloth pieces, 6% (3%) use reused cloth pieces. Except for attending school, many restrictions were imposed on them during menstruation including participation in religious activities, festivals, attending household chores, food restrictions, etc.

Conclusions: Various cultural practices and ignorance are affecting the menstrual hygiene of the adolescent girls and they need to be educated in this regard.

Keywords: Adolescent girls, Menstruation, Menstrual hygiene

INTRODUCTION

The World Health Organisation (WHO) has defined adolescence as the period between 10 and 19 years, a critical period of life characterised by rapid growth and development, both physiologically, psychologically and socially. Adolescents constitute about 22 per cent of India’s population. Menstruation is the physiological process which starts at menarche at or before sexual maturity, in females and ceases at or near menopause. But its physiology and nature are very poorly understood among the female population due to many socio-cultural factors which make them to adapt certain practices unknowingly whether it is correct or false. Adolescent girls constitute a vulnerable group, particularly in India where female child is neglected one.
Menstruation is still regarded as something unclean or dirty in Indian society. The manner in which a girl learns about menstruation and its associated changes may have an impact on her response to the event of menarche. Although menstruation is a natural process, it is linked with several misconceptions and practices, which sometimes result into adverse health outcomes. Women having better knowledge regarding menstrual hygiene and safe practices are less vulnerable to reproductive tract infections and its consequences. Therefore, increased knowledge about menstruation right from childhood may escalate safe practices and may help in mitigating the suffering of millions of women.

Although many studies were conducted to assess the menstrual practices, the diversity of cultural practices in India, mandates to investigate on menstrual hygiene. This study was done to explore the menstrual practices, knowledge, cultural beliefs and experiences regarding menstrual practices among the adolescent female population residing in rural areas, as there are very few studies done in this part of this country.

**Aim**

To study the determinants of menstrual hygiene among the rural adolescent girls residing in field practice area of NRI Medical College, Guntur.

**Objectives**

- To determine the factors affecting the existing practices of menstrual hygiene among the adolescent girls.
- To study the beliefs, conception, source of information regarding menstruation among the study population.

**METHODS**

A cross-sectional observational study was conducted in Chinakakani village. The field practice area of NRI Medical College and General Hospital, a rural medical college in Guntur district, Andhra Pradesh. The population of Chinakakani village is 6230, consisting of a total of 1175 families residing in the village. The study village has a population of 6,230, consisting a total of 1175 families residing in the village.

**Sample size**

The sample size was calculated based upon the formula 4 PQ/L^2, where P was assumed prevalence of unhygienic menstrual practices among adolescent girls, Q was 100-P, and L (allowable error) was taken at 15% of P. Review of different studies showed the prevalence of unhygienic menstrual practices among adolescent girls is around 48%. So, n=4 × 48 × 52/7.2 × 7.2=192.5. The sample size was rounded off to 200 adolescent girls.

**Duration of study**

Data collection was carried out three months from January 2019 to March 2019.

**Study participants**

All adolescent girls resident of the study village aged 10 to 19 years were eligible to participate in the study. All the eligible participants were listed by conducting a house to house visit by the principal investigator 200 study subjects were selected by systematic random method.

**Exclusion criteria**

Residents of the village aged <10 years and ≥20 years, all non-residents/visitors to the village, adolescent males, and adolescent girls of the village who would not like to participate were excluded from the study.

**Study tools**

General information pertaining to age, literacy status and occupation of subject, their parents, caste, religion, marital status, family income, total members in the family, number of siblings etc. was obtained by interview method and recorded on a pre-designed and pre-tested structured schedule. Informed consent of the respondent was obtained before administration of the schedule. Institutional Ethical Clearance was obtained prior to the start of the study.

**Statistical analysis**

The data collected was analyzed using Microsoft Excel and Epi Info statistical package. The data was then summarized in the form of tables and graphs.

**RESULTS**

A total of 200 adolescent girls were studied as part of the study. Here are the results of the present study.

**Socio-demographic factors**

Nearly one quarter (23%) of the adolescent girls were aged 19 years. More than half (57.5%) of the study population had secondary school level education. Hindus and Christians are almost equal in number. 175 (87.50%) of the adolescent girls in the study are unmarried. 31 (15.50%) respondents are living in families with a monthly income of <Rs. 5,000, and 87 (43.50%) were earning >Rs.10,000 monthly household income. Most of the families are nuclear (82%) and 89% girls are living with their parents, 17 people out of 200 live with their relatives, 2 with mother only and 3 with father only. Mothers of 97 (48.50%) adolescent girls are illiterates, 41 (20.50%) completed primary education, 51 (25.50%) completed secondary education and 11 (5.50%) are above level of secondary education.
Table 1: Socio-demographic profile of the study subjects (n=200).

| Age of the respondent (in years) | Frequency | %  |
|----------------------------------|-----------|----|
| 11                               | 2         | 1.0|
| 12                               | 4         | 2.0|
| 13                               | 24        | 12.0|
| 14                               | 31        | 15.5|
| 15                               | 19        | 9.5 |
| 16                               | 29        | 14.5|
| 17                               | 18        | 9.0 |
| 18                               | 27        | 13.5|
| 19                               | 46        | 23.0|
| **Education**                    |           |    |
| Illiterate                       | 5         | 2.5 |
| Primary school                   | 10        | 5.0 |
| Secondary school                 | 115       | 57.5|
| Intermediate and above           | 70        | 35.0|
| **Religion**                     |           |    |
| Christian                        | 99        | 49.5|
| Hindu                            | 101       | 50.5|
| **Current marital status**       |           |    |
| Married                          | 25        | 12.5|
| Single                           | 175       | 87.5|
| **Monthly household income (in rupees)** |          |    |
| <5,000                           | 31        | 15.5|
| 5,000-10,000                     | 82        | 41.0|
| >10,000                          | 87        | 43.5|
| **Type of family**               |           |    |
| Joint                            | 36        | 18.0|
| Nuclear                          | 164       | 82.0|
| **Living arrangement**           |           |    |
| With father only                 | 3         | 1.5 |
| With mother only                 | 2         | 1.0 |
| Both parents                     | 178       | 89.0|
| With relatives                   | 17        | 8.5 |
| **Mother’s education**           |           |    |
| Illiterate                       | 97        | 48.5|
| Primary school                   | 41        | 20.5|
| Secondary school                 | 51        | 25.5|
| Intermediate and above           | 11        | 5.5 |
| **Father’s education**           |           |    |
| Illiterate                       | 82        | 41.0|
| Primary school                   | 30        | 15.0|
| Secondary school                 | 59        | 29.5|
| Intermediate and above           | 29        | 14.5|
| **Type of house**                |           |    |
| Kutcha                           | 33        | 16.5|
| Pucca                            | 167       | 83.5|
| **Functional sanitary latrine**  |           |    |
| Present                          | 176       | 88.0|
| Absent                           | 24        | 12.0|
| **Aware of ad promoting sanitary pads usage** |      |    |
| Yes                              | 185       | 92.5|
| No                               | 15        | 7.5 |

Fathers of 82 (41%) adolescent girls are illiterates, 30 (15%) completed primary education, 59 (29.50%) completed secondary education, 29 (14.50%) are above secondary education level. 167 (83.50%) respondents live in pucca houses and 33 (16.50%) live in kutcha type of houses. Most of the adolescent girls 176 (88%) had access to toilet facility at their homes. Most of the respondents 185 (92.5%) are aware of the advertisements promoting the use of sanitary pads in media (Table 1).

Menarche

Nearly three fourths (73.5%) of the adolescent girls attained menarche before the age of 14 years. Most of the respondents 173 (87.0%) have no knowledge about menarche and 154 (77%) did not know about menstruation prior to menarche. In those who were aware about menstruation (23%), mother was the main source of information (Table 1).

Table 2: Menarche (n=200).

| Age at menarche | Frequency | %  |
|-----------------|-----------|----|
| <12             | 23        | 11.5|
| 12 to 14        | 160       | 80.0|
| >14             | 17        | 8.5 |
| **Awareness about menstruation prior to menarche** | |    |
| Yes             | 26        | 13.0|
| No              | 174       | 87.0|
| **Source of information before menarche** | |    |
| Friend          | 9         | 4.5 |
| Media           | 1         | 0.5 |
| Mother          | 29        | 14.5|
| Relative        | 7         | 3.5 |
| None            | 154       | 77.0|

Perceptions about menstruation

More than half 106 (53%) of the girls did not know about cause of menstruation.

Table 3: Awareness regarding menstruation (n=200).

| Cause of menstruation | Frequency | %  |
|------------------------|-----------|----|
| Curse of god           | 2         | 1.0|
| Physiological cause    | 92        | 46.0|
| Don't know             | 106       | 53.0|
| **Organ from which menstrual blood comes** | |    |
| Uterus                 | 13        | 6.5 |
| Stomach                | 1         | 0.5 |
| Don't know             | 186       | 93.0|
| **Absorbent ideally used for menstruation** | |    |
| Cloth piece            | 15        | 7.5 |
| Sanitary pad           | 185       | 92.5|
92 (46%) of the girls believed it to be a physiological process, 2 (1%) girls believed it to be due to the curse of God. Only 13 (6.5%) girls were aware that uterus is the organ of menstruation. Many of the respondents 185 (92.5%) felt commercially made sanitary pads to be ideal absorbent during menstruation (Table 5).

Practice of menstrual hygiene

Majority (86%) respondents use sanitary pads, while only 14 (7%) use new cloth pieces, 6 (3%) use reused cloth pieces. Frequency of cleaning external genitalia is once in 15 (7.5%), twice in 128 (64%), more than 2 times in 57 (28.5%) girls during the menstrual periods. For cleaning the external genitalia, majority 163 (81.5%) use water only, while 37 (18.5%) girls use soap and water. Fifteen adolescent girls reported that they were deprived of privacy for changing sanitary pads and cleaning of external genitalia, either at school or at home. Seven (3.5%) girls re-used the cloth pieces whereas, most of them 193 (96.50%) disposed the used sanitary pads or cloth pieces properly (Table 4).

Table 4: Menstrual hygiene practices (n=200).

| Material used during menstruation | Frequency | %  |
|-----------------------------------|-----------|----|
| New cloth pieces                  | 14        | 7.0|
| Re-used cloth pieces              | 6         | 3.0|
| Sanitary pads                     | 172       | 86.0|
| All                               | 8         | 4.0|

Frequency of cleaning of external genitalia

| Frequency          | %  |
|--------------------|----|
| Once daily         | 15 | 7.5|
| Twice daily        | 128| 64.0|
| >Twice daily       | 57 | 28.5|

Used for cleaning purpose

| Used for cleaning purpose | Frequency | %  |
|---------------------------|-----------|----|
| Water only                | 163       | 81.5|
| Soap and water           | 37        | 18.5|

Privacy for changing pads during menstruation

| Privacy for changing pads during menstruation | Frequency | %  |
|-----------------------------------------------|-----------|----|
| Present                                      | 185       | 92.5|
| Absent                                       | 15        | 7.5|

Method of disposal of used sanitary pads/ cloth pieces

| Method of disposal of used sanitary pads/ cloth pieces | Frequency | %  |
|-------------------------------------------------------|-----------|----|
| Cloth pieces re-used                                  | 7         | 3.5|
| Disposed in a bin                                     | 193       | 96.5|

Restrictions practiced during menstruation

During menstruation, 17 (8.50%) adolescent girls were restricted in type of dressing, 105 (52.50%) did not attend any religious occasion, 100 (50%) did not attend marriage, 24 (12%) were restricted from playing, 23 (11.50%) from household work, 16 (8%) from interacting with boys, 62 (31%) from travelling alone, 48 (24%) were confined to house. Food restrictions like avoiding certain vegetables like potato, brinjal, curd were also noticed during menstruation in the present study. However, more than 95% of the girls were not prevented from attending school during menstruation (Table 5).

Table 5: Restrictions practised during menstruation (n=200).

| Restrictions                      | Yes (N) | No (N) |
|-----------------------------------|---------|--------|
| Type of clothes worn              | 17 (8.5)| 183 (91.5)|
| Attending religious occasion      | 105 (52.5)| 95 (47.5)|
| Attending marriage                | 100 (50.0)| 100 (50.0)|
| Attending school                  | 9 (4.5) | 191 (95.5)|
| Playing with friends              | 24 (12.0) | 176 (88.0)|
| Household work                    | 23 (11.5)| 177 (88.5)|
| Types of food                     | 88 (44.0) | 112 (56.0)|
| Interaction with boys             | 16 (8.0) | 184 (92.0)|
| Travel                            | 62 (31.0) | 138 (69.0)|
| Confinement to house              | 48 (24.0) | 152 (76.0)|

DISCUSSION

Socio-demographic factors

More than half (57.5%) the adolescent girls in the present study had secondary school level education which is like in various studies done elsewhere. In studies done elsewhere in India, Hindus accounted for the majority (84% to 95%), whereas in the current study, Hindus and Christians were almost equal in number. About 12.5% of the adolescent girls were married in the present study. Since most of the similar studies done in India dealt with school children, there was no mention regarding the marital status in the review of literature. Nearly 85% of the families of the adolescent girls are earning a monthly income ≥Rs. 5,000. Per capita income was found to be between Rs. 600-Rs. 1000. Per capita income was not calculated in the present study. Nuclear families are popular (82%) in the present study. They varied from 60% to 73.6% in studies done elsewhere in the country. Nuclear families are becoming popular these days, similar to the various studies done, but more so in the present study. Nearly half (48.5%) of the mothers, 41% of fathers are illiterate in the present study, only 5.5% of the mothers and 14.5% of the fathers had college level education. When compared to a study done in Amritsar which reported that fathers and mothers of the respondents had almost equal level of education i.e., graduation 106 (35.4%) and 115 (38.3%) respectively. The literacy level is poor among the parents of the adolescent girls in the present study when compared to the national figures. 83.5% of the adolescent girls are living in pucca houses. The housing standards are good in the present study population. Nearly 9 out of 10 families of the adolescent girls are having a functional sanitary latrine and using them.
Awareness regarding advertisements promoting sanitary pads usage in the media

More than 90% of the adolescents have seen or heard advertisements promoting sanitary pads usage in the media. In a study done on adolescent girls in Rajasthan, more than half of the girls were ignorant about the use of sanitary pads during menstruation.16 The awareness levels are better in the present study population.

Menarche

8 out of 10 adolescent girls attained menarche between 12 to 14 years of age. In Rajasthan, it was observed that the mean age at menarche to be 13.2 years.16 The age at menarche in the present study is similar to the study done in Rajasthan.

Awareness about menstruation prior to menarche

In the present study only 13% of the respondents have some knowledge regarding menarche. In rural West Bengal, awareness about menstruation prior to attainment of menarche varied from 37.52% to 67.5%, whereas it is between 42% to 55.4% in urban West Bengal.3,9 Awareness regarding menarche prior to menarche is lacking in the present study population when compared to other studies done elsewhere in the country.

Source of information before menarche

Mother is the main source of information prior to attaining menarche in 14.5% of the adolescent girls, followed by friends (4.5%) in the current study. Teacher was found to be the main source of information (27.01%) regarding menarche in rural West Bengal, whereas mother (60.7%) or an elder sister (15.8%) was the main source of information in rural Gujarat.9,18 Mother is the main source of information regarding menarche in the present study as like in other studies done previously.

Perception about menstruation

Cause of menstruation

More than half (53%) of the girls were unaware of the cause of menstruation and 46% believed it to be a physiological process in the present study. Awareness regarding the cause of menstruation varied from 6% among adolescent girls in Nepal, 21.07% in West Bengal, 31% in rural Gujarat.8,18,19 The awareness levels regarding the cause of menstruation in the present study is better than that in other studies.

Source of blood during menstruation

Most of the adolescent girls (93%) were unaware of the source of blood during menstruation. Most of the adolescent girls were not aware of the source of menstrual blood which varied from 40% to 97.5% from various studies done in the country.6,7,11,13,15 The level of knowledge is poor in present study reflecting the similarities from other parts of the country.

Practice of menstrual hygiene

Material that the respondents commonly use during menstruation

Majority (86%) of the respondents are using sanitary pads, 10% are using cloth pieces which are reused by 3% girls, in the present study. Indian Council of Medical Research (Annual Report 2005-06) observed that nearly 57.6% girls reused cloth during menstruation.21 Studies done elsewhere in India observed that most of the adolescent girls were reusing the cloth, where it varied from 54.88% in rural West Bengal to 74.5% in Mumbai, and 75% in rural Rajasthan.8,16,17 Only 20% adolescent girls were using sanitary napkins in Rural Rajasthan.16 Sanitary pads usage is better in the present study than in other parts of the country.

Cleaning of external genitalia

More than 92% of the study subjects clean their external genitalia two or more times per day and majority (81.5%) use only water for this purpose, soap and water were used by only 18.5% of the adolescent girls in the current study. More than half (57%) of urban adolescent girls in Chennai used only water for cleaning the external genitalia and 6% used antiseptics also.11 Both soap and water were used for cleaning purpose in 97.5% adolescent girls in rural West Bengal, whereas it is 37% among urban adolescent girls in Chennai.8,11 The level of hygiene is somewhat better in the present study when compared to adolescent girls in remaining parts of the country.

Privacy for changing sanitary pads during menstruation

Either at school or at home, majority (92.5%) of the respondents had privacy (toilet with enclosure) for changing pads during menstruation in the present study. More than half of the adolescent girls in West Bengal (51.25%) and 56.39% were deprived of toilet facility with proper enclosure at home.6,8 The adolescent girls in the present study are better than their counterparts elsewhere in the country in terms of availability of privacy (covered toilet).

Method of disposal of used sanitary pads/cloth pieces

Majority (96.5%) of the respondents disposed the sanitary pads or cloth pieces properly in the present study.

Restrictions practiced during menstruation

In the present study, only 27% adolescent girls reported that no restrictions were imposed by their parents or other family members during menstruation. Majority of the
adolescent girls in rural West Bengal (85%) and 96% girls in rural East Delhi did not follow any restrictions during menstruation. The prevalence of restrictions on the adolescent girls during menstruation is more in the current study population compared to other parts of the country.

Restrictions in food

44% adolescent girls were restricted their normal diet during the days of menstruation. Half of the adolescent girls in rural West Bengal, 56% rural girls in East Delhi and 80% girls in Hooghly district reported restrictions to different types of foods. Foods restricted include sour foods, oily and spicy foods. Foodstuffs restricted include banana, radish, palm, etc. The prevalence of dietary restrictions is few in the present study.

Restriction on religious occasions

Restrictions on religious occasions was seen in nearly half (52.5%) of the respondents in the present study. Dasgupta et al, in their study reported 96 (70.59%) girls did not attend any religious occasion. In West Bengal, 76.96% of urban girls did not attend any religious occasion whereas in rural girls this percentage was little higher as 78.57%. In rural area of East Delhi, 92% of the girls were restricted from worshipping. Not visiting a temple (75.6%) is the most common restriction elsewhere. The prevalence of restrictions on religious occasions is less in the present study.

Restriction in attending marriage

Half of the adolescent girls were not allowed to attend marriages during the days of menstruation. In rural West Bengal, 10.29% girls did not attend any marriage ceremony during the menstrual period. The prevalence of restrictions in attending marriages is higher in the present study.

Restriction in going to school

Only 4.5% respondents were restricted by their parents/family members from attending school during menstruation. In rural West Bengal, 16.18% girls did not attend school. In another comparative study done in West Bengal, 10.67% of urban girls did not attend school where as in rural area it is 17.70%. Very few families are restricting their children from going to school in the present study during menstruation.

Restriction in doing household work

More than 1 in 10 adolescent girls were restricted from doing their household work during menstruation. In rural West Bengal, 33.82% girls did not perform any household work, while in rural area of East Delhi, 70% adolescent girls were restricted from participating in household activities. The restrictions in participating in household activities in the present study are less when compared to other studies done in the country.

Restricted in playing

12% of the adolescent girls reported restrictions being imposed from going outside to playing with friends during menstruation by their parents. In rural West Bengal, 42.65% girls were not allowed to play, whereas in another study done in the same state, 33.14% urban girls and 28.22% rural girls were restricted from playing outside during menstruation by their parents. The prevalence of restrictions imposed on the adolescent girls are few when compared with studies done else where in the country.

CONCLUSION

Female literacy rate is lagging behind in the present study population. Adult literacy rate is also poor in the present study. Presence of a functional sanitary latrine at home and their utilisation is good. Awareness due to advertisements in the media is good in the present study population. Age at menarche is around 12 to 14 years. Awareness regarding menstruation prior to menarche is poor among the rural adolescent girls. Mother, friends are the main source of information among those who know. The perception about menstruation is poor, especially the cause and source of menstrual blood among the rural adolescent girls. Even though most of the rural adolescent girls were aware of the ideal absorbent to be used during menstruation, some of them were using cloth pieces, which were commonly re-used. The maintenance of menstrual hygiene is satisfactory among the majority of the adolescent girls. The method of disposal of used sanitary pads/cloth pieces is satisfactory. Privacy for changing sanitary pads during menstruation is satisfactory, by availability of enclosed toilets at home and in schools. Nearly three-fourths of the rural adolescent girls reported restrictions imposed by family members, the most common being attending a religious occasion, marriage, certain types of foods, avoiding travel and confinement to house, etc.
