In this paper, we prove a fixed point theorem in complex partial $b$-metric space under new contraction mapping. The proved results generalize and extend some of the well-known results in the literature. We also give some applications of our main results.

1. Introduction

Introduced in 1989 by Bakhtin [1] and Czerwik [2], the concept of $b$-metric spaces provided a framework to extend the results already known in the classical setting of metric spaces. About two decades later, more precisely in 2011, Azamet al. [3] came up with the notion of complex-valued metric spaces and provided some common fixed point theorems under some contractive conditions. Two years after, it was in [4] Rao et al. discussed for the first time the idea of complex-valued $b$-metric spaces.

It was just very recently, in 2017, that Dhihya and Marudai [5] extended all the preceding results in the setting of complex partial metric spaces making use of a rational type contraction.

This was followed by Gunaseelan [6], who introduced the concepts of complex partial $b$-metric spaces and discussed some results of fixed point theory for self-mappings in these new spaces.

Many authors have studied related interesting metric such as structures along with some applications. And, in this line, significant results have been obtained and can be read in [7–23]. In this paper, under new contraction condition, we prove a fixed point theorem in complex partial $b$-metric space. Although there have been a significant amount of scientific contributions to the theory of partial $b$-metric space, very few address that of complex valued, and even less, the applicability of complex partial $b$-metrics in the resolution integral equations. This, however, in one the main contributions of the present work. We begin by recalling basic facts about complex partial $b$-metric spaces.

2. Preliminaries

Let $\mathbb{C}$ be the set of complex numbers and $\bar{\omega}_1, \bar{\omega}_2, \bar{\omega}_3 \in \mathbb{C}$. Define a partial order $<$ on $\mathbb{C}$ as follows: $\bar{\omega}_1 < \bar{\omega}_2$ if and only if $\text{Re.part}(\bar{\omega}_1) \leq \text{Re.part}(\bar{\omega}_2)$, $\text{Im.part}(\bar{\omega}_1) \leq \text{Im.part}(\bar{\omega}_2)$.

Consequently, one can infer that $\bar{\omega}_1 < \bar{\omega}_2$ if one of the following conditions is satisfied:

(i) $\text{Re.part}(\bar{\omega}_1) = \text{Re.part}(\bar{\omega}_2)$ and $\text{Im.part}(\bar{\omega}_1) < \text{Im.part}(\bar{\omega}_2)$
(ii) $\text{Re. part}(\omega_1) < \text{Re. part}(\omega_2)$ and $\text{Im. part}(\omega_1) = \text{Im. part}(\omega_2)$

(iii) $\text{Re. part}(\omega_1) < \text{Re. part}(\omega_2)$ and $\text{Im. part}(\omega_1) < \text{Im. part}(\omega_2)$

(iv) $\text{Re. part}(\omega_i) = \text{Re. part}(\omega_j)$ and $\text{Im. part}(\omega_i) = \text{Im. part}(\omega_j)$

In particular, we write $\omega_1 \preceq \omega_2$ if $\omega_1 \neq \omega_2$ and one of (i), (ii), and (iii) is satisfied, and we write $\omega_1 \prec \omega_2$ if only (iii) is satisfied. Notice that

(a) If $0 < |\omega_1| < |\omega_2|$

(b) If $|\omega_1| < |\omega_2|$ and $\omega_2 \prec \omega_1$, then $\omega_1 \prec \omega_2$

(c) If $\tau, \gamma \in \mathbb{R}$ and $\tau \leq \gamma$, then $\omega_1 \prec \omega_2$ for all $0 < \omega_1 \in \mathbb{C}$

**Definition 1** (see [4]). Let $\Theta$ be a nonvoid set and let $s \geq 1$ be a given real number. A function $d : \Theta \times \Theta \rightarrow \mathbb{C}$ is called a complex-valued $b$-metric on $\Theta$ if, for all $e, f, g \in \Theta$, the following conditions are satisfied:

(i) $0 < d(e, f) < d(e, f) = 0$ and only if $e = f$

(ii) $d(e, f) - d(f, g) = d(e, g)$

(iii) $d(e, f) \leq s[d(e, g) + d(g, f)]$

The pair $(\Theta, d)$ is called a complex-valued $b$-metric space.

Here, $\mathbb{C}^+ = \{e \in \mathbb{C} : e \geq 0\}$ and $\mathbb{R}^+ = \{e \in \mathbb{R} : e \geq 0\}$ denote the set of nonnegative complex numbers and the set of nonnegative real numbers, respectively. We now give the complex partial metric space.

**Definition 2** (see [5]). A complex partial metric on a nonvoid set $\Theta$ is a function $\xi : \Theta \times \Theta \rightarrow \mathbb{C}^+$ such that, for all $\alpha, \beta, \gamma \in \Theta$,

(i) $0 < \xi(\alpha, \alpha) < \xi(\alpha, \beta)$ (small self-distances)

(ii) $\xi(\alpha, \beta) = \xi(\beta, \alpha)$ (symmetry)

(iii) $\xi(\alpha, \beta) = \xi(\gamma, \beta)$ if and only if $\alpha = \beta$ (equality)

(iv) $\xi(\alpha, \beta) < \xi(\alpha, \gamma) + \xi(\gamma, \beta)$ (triangularity)

A complex partial metric space is a pair $(\Theta, \xi)$ such that $\Theta$ is a nonvoid set and $\xi$ is the complex partial metric on $\Theta$.

**Definition 3** (see [6]). A complex partial $b$-metric on a nonvoid set $\Theta$ is a function $\gamma_{cb} : \Theta \times \Theta \rightarrow \mathbb{C}^+$ such that, for all $\alpha, \beta, \gamma \in \Theta$,

(i) $0 < \gamma_{cb}(\alpha, \alpha) < \gamma_{cb}(\alpha, \beta)$ (small self-distances)

(ii) $\gamma_{cb}(\alpha, \beta) = \gamma_{cb}(\beta, \alpha)$ (symmetry)

(iii) $\gamma_{cb}(\alpha, \beta) = \gamma_{cb}(\gamma, \beta) \iff \alpha = \beta$ (equality)

(iv) $\exists a$ a real number $s \geq 1$ and $s$ is an independent of $\alpha, \beta, \gamma$ such that $\gamma_{cb}(\alpha, \beta) \leq s(\gamma_{cb}(\alpha, \gamma) + \gamma_{cb}(\gamma, \beta))$

$\gamma_{cb}(\alpha, \beta) \prec \gamma_{cb}(\gamma, \beta)$ (triangularity)

A complex partial $b$-metric space is a pair $(\Theta, \gamma_{cb})$ such that $\Theta$ is a nonvoid set and $\gamma_{cb}$ is the complex partial $b$-metric on $\Theta$. The number $s$ is called the coefficient of $(\Theta, \gamma_{cb})$.

**Remark 1** (see [6]). In a complex partial $b$-metric space $(\Theta, \gamma_{cb})$ if $a, \beta \in \Theta$ and $\gamma_{cb}(a, \beta) = 0$, then $a = \beta$, but the converse may not be true.

Every complex partial $b$-metric $\gamma_{cb}$ on a nonvoid set $\Theta$ generates a topology $\tau_{cb}$ on $\Theta$ whose base is the family of open $\gamma_{cb}$-balls $B_{\gamma_{cb}}(\alpha, \varepsilon)$, where $\tau_{cb} = \{B_{\gamma_{cb}}(\alpha, \varepsilon) : \alpha \in \Theta, \varepsilon > 0\}$ and $B_{\gamma_{cb}}(\alpha, \varepsilon) = \{\beta \in \Theta : \gamma_{cb}(\alpha, \beta) < \varepsilon + \gamma_{cb}(\alpha, \alpha)\}$.

Now, we define Cauchy sequence and convergent sequence in complex partial $b$-metric spaces.

**Definition 4** (see [6]). Let $(\Theta, \gamma_{cb})$ be a complex partial $b$-metric space with coefficient $s$. Let $\{a_n\}$ be any sequence in $\Theta$ and $a \in \Theta$. Then

(i) The sequence $\{a_n\}$ is said to be convergent with respect to $\gamma_{cb}$ and converges to $a$ if $\lim_{n \rightarrow \infty} \gamma_{cb}(a_n, a) = \gamma_{cb}(a, a)$

(ii) The sequence $\{a_n\}$ is said to be Cauchy in $(\Theta, \gamma_{cb})$ if $\lim_{n,m \rightarrow \infty} \gamma_{cb}(a_n, a_m)$ exists and is finite

(iii) $(\Theta, \gamma_{cb})$ is said to be a complete complex partial $b$-metric space if, for every Cauchy sequence $\{a_n\}$ in $\Theta$, there exists $a \in \Theta$ such that $\lim_{n \rightarrow \infty} \gamma_{cb}(a_n, a) = \gamma_{cb}(a, a)$

(iv) A mapping $\Xi : \Theta \rightarrow \Theta$ is said to be continuous at $a_0 \in \Theta$ if, for every $\varepsilon > 0$, there exists $\delta > 0$ such that $\Xi(B_{\gamma_{cb}}(a_0, \delta)) \subseteq B_{\gamma_{cb}}(\Xi(a_0), \varepsilon)$

Let $(\Theta, \gamma_{cb})$ be a complete complex partial $b$-metric space $\Theta \times \Theta \rightarrow \mathbb{C}^+$ with $\gamma_{cb} = (\max|\alpha, \beta|^2 + i(\max|\alpha, \beta|^2))\gamma_{cb}$, where $\theta \in \Theta$.

In 2019, Gunaseelan [6] proved the following theorem.

**Theorem 1** (see [6]). Let $(\Theta, \gamma_{cb})$ be a complete complex partial $b$-metric space with coefficient $s \geq 1$ and $\Xi : \Theta \rightarrow \Theta$ be a mapping satisfying the following condition:

$$\gamma_{cb}(\Xi a, \Xi \beta) < \gamma_{cb}(\alpha, \Xi a) + \gamma_{cb}(\beta, \Xi \beta), \quad \forall a, \beta \in \Theta,$$

where $a \in [0, (1/s)]$. Then, $\Xi$ has a unique fixed point $\gamma \in \Theta$ and $\gamma_{cb}(\gamma, \gamma) = 0$. 

Inspired by Theorem 1, we prove a fixed point theorem on complex partial $b$-metric space under new contraction mapping.

In Section 3, we first prove, under new contraction mapping, a fixed point theorem on complete complex partial $b$-metric space. We also provide an example of the complete complex partial $b$-metric space and clarify that, under certain conditions, it has a unique fixed point.

3. Main Results

**Theorem 2.** Let $(\Theta, \gamma_{cb})$ be a complete complex partial $b$-metric space with constant $s \geq 1$ and let $\Xi$ be a self-mapping on $\Theta$. Suppose that there exist functions $\tau_i, i = 1, 2, 3, 4, 5,$ of $C^*$ into $C^*$ such that

1. Each $\tau_i$ is upper semicontinuous from the right.
2. For any distinct $\alpha, \beta \in \Theta$,

   $\gamma_{cb}(\alpha, \beta)^2 = \gamma_{cb}(\alpha, \beta)\gamma_{cb}(\Xi\alpha, \Xi\beta)$

   $\leq \tau_1(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta) + \tau_2(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \Xi\beta)$

   $+ \tau_3(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\Xi\alpha, \beta) + \tau_4(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \Xi\alpha)$

   $+ \tau_5(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\beta, \Xi\beta)$

   $= \tau_1(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta) + \tau_2(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta)$

   $+ \tau_3(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta) + \tau_4(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \alpha)$

   $+ \tau_5(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\beta, \beta)$

   $\leq \tau_1(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta) + \tau_2(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta)$

   $+ \tau_3(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \beta) + \tau_4(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \alpha)$

   $+ \tau_5(\gamma_{cb}(\alpha, \beta))\gamma_{cb}(\alpha, \alpha)$

   $= (\tau_1(\gamma_{cb}(\alpha, \beta)) + \tau_2(\gamma_{cb}(\alpha, \beta)) + \tau_3(\gamma_{cb}(\alpha, \beta)) + \tau_4(\gamma_{cb}(\alpha, \beta)) + \tau_5(\gamma_{cb}(\alpha, \beta)))\gamma_{cb}(\alpha, \beta)$

   $\leq 1 - \frac{1}{2s}\gamma_{cb}(\alpha, \beta)$

   $< \gamma_{cb}(\alpha, \beta),$

which implies that

$$|\gamma_{cb}(\alpha, \beta)|^2 < |\gamma_{cb}(\alpha, \beta)|,$$

which is impossible. Therefore, $\alpha = \beta$. Choose $\alpha_1 \in \Theta$. Set

$$\alpha_2 = \Xi\alpha_1, \ldots, \alpha_{m+1} = \Xi\alpha_m = \Xi^{m+1}\alpha_1,$$

which indicates that $\gamma_{cb}(\alpha, \beta) < 0$. If there exists $m \in \mathbb{N}$ such that

$$\gamma_{cb}(\alpha, \beta) = 0,$$

then $\Xi$ has a unique fixed point.

**Proof.** Let us first prove that if fixed points of $\Xi$ exists, then it is unique. Let $\alpha, \beta \in \Theta$ be two distinct fixed points of $\Xi$, that is, $\Xi\alpha = \alpha \neq \beta = \Xi\beta$. Then, $\gamma_{cb}(\alpha, \beta) > 0$. If $\gamma_{cb}(\alpha, \alpha) = 0$, we have $0 = (1/2s)\gamma_{cb}(\alpha, \alpha) = (1/2s)\gamma_{cb}(\alpha, \Xi\alpha) < \gamma_{cb}(\alpha, \beta)$. If $\gamma_{cb}(\alpha, \alpha) > 0$. By the definition of complex partial $b$-metric space, we obtain

$$\frac{1}{2s}\gamma_{cb}(\alpha, \alpha) = \frac{1}{2s}\gamma_{cb}(\alpha, \alpha) < \gamma_{cb}(\alpha, \beta).$$

From condition (C3), we derive

$$\frac{1}{2s}\gamma_{cb}(\alpha, \alpha) < \gamma_{cb}(\alpha, \beta),$$

which implies that

$$|\gamma_{cb}(\alpha, \beta)|^2 < |\gamma_{cb}(\alpha, \beta)|,$$

which is impossible. Therefore, $\alpha = \beta$. Choose $\alpha_1 \in \Theta$. Set

$$\alpha_2 = \Xi\alpha_1, \ldots, \alpha_{m+1} = \Xi\alpha_m = \Xi^{m+1}\alpha_1.$$
From (2), we derive

\[
\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(\Xi a_m, \Xi^2 a_m) \leq \tau_1 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(a_m, \Xi a_m)) + \tau_2 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(a_m, \Xi^2 a_m)) + \tau_3 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(\Xi a_m, \Xi a_m)) + \tau_4 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(a_m, \Xi a_m)) + \tau_5 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(\Xi a_m, \Xi^2 a_m))
\]

\[
\leq \tau_1 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(a_m, \Xi a_m)) + \tau_2 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(a_m, \Xi^2 a_m)) + \tau_3 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(\Xi a_m, \Xi^2 a_m)) + \tau_4 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(a_m, \Xi^2 a_m)) + \tau_5 (\gamma_{cb}(a_m, \Xi a_m) Y_{cb}(\Xi a_m, \Xi^2 a_m))
\]

\[
≤ \left[ \tau_1 (\gamma_{cb}(a_m, \Xi a_m)) + \tau_2 (\gamma_{cb}(a_m, \Xi a_m)) + \tau_3 (\gamma_{cb}(a_m, \Xi^2 a_m)) + \tau_4 (\gamma_{cb}(\Xi a_m, \Xi a_m)) + \tau_5 (\gamma_{cb}(\Xi a_m, \Xi^2 a_m)) \right] Y_{m+1} Y_m
\]

which implies that

\[
\gamma_{m+1} Y_{m+1} \leq \frac{\left[ \tau_1 (\gamma_{cb}(a_m, \Xi a_m)) + \tau_2 (\gamma_{cb}(a_m, \Xi a_m)) + \tau_3 (\gamma_{cb}(a_m, \Xi^2 a_m)) + \tau_4 (\gamma_{cb}(\Xi a_m, \Xi a_m)) + \tau_5 (\gamma_{cb}(\Xi a_m, \Xi^2 a_m)) \right] Y_{m+1} Y_m}{\gamma_m - \tau_2 (Y_m) - \tau_5 (Y_m)}.
\]

(9)

From \(C_3\), we obtain

\[
\tau_1 (v) + 2s \tau_2 (v) + 2s \tau_3 (v) + \tau_4 (v) + \tau_5 (v) < 2s \left( \tau_1 (v) + \tau_2 (v) + \tau_3 (v) + \tau_4 (v) + \tau_5 (v) \right)
\]

(11)

which implies that

\[
|\gamma_{cb}(a_{m+1}, \Xi a_{m+1})| < |\gamma_{cb}(a_m, \Xi a_m)|, \quad \forall m \in \mathbb{N}.
\]

(14)

Consequently, \(\text{Re}.\part(\gamma_{m+1}) < \text{Re}.\part(\gamma_m)\) and \(\text{Im}.\part(\gamma_{m+1}) < \text{Im}.\part(\gamma_m)\). Therefore, \(\{\text{Re}.\part(\gamma_m)\}\) is a decreasing sequence of real numbers which is bounded from below. So, \(\{\text{Re}.\part(\gamma_m)\}\) converges to some point \(\gamma \in [0, \infty)\). Similarly, \(\{\text{Im}.\part(\gamma_m)\}\) converges to some point \(\gamma \in [0, \infty)\).

and consequently,

\[
\gamma_m Y_{m+1} < \left[ \tau_1 (Y_m) + \tau_2 (Y_m) + 2s \tau_3 (Y_m) + \tau_4 (Y_m) \right] Y_m
\]

(10)
\[ V = \lim_{m \to \infty} V_{m+1} = \lim_{m \to \infty} \sup_{m+1} V_{m+1} \]

\[ \leq \lim_{m \to \infty} \frac{\tau_1(Y_m') + s\tau_3(Y_m') + 2s\tau_3(Y_m') + \tau_4(Y_m')}{Y_m - \tau_5(Y)} \]

\[ = \frac{\tau_1(Y) + s\tau_3(Y) + 2s\tau_3(Y) + \tau_4(Y)}{Y - \tau_5(Y)} \]

\[ < V, \]

(15)

which implies that \(|V| < |V|\), which is impossible. Therefore,

\[ \lim_{m \to \infty} V_m = \lim_{m \to \infty} V_{cb}(\alpha_m, \Xi \alpha_m) = 0. \]

(16)

Next, we prove that

\[ \lim_{m \to \infty} V_{cb}(\alpha_m, \alpha_m) = 0. \]

(17)

Suppose not, we assume that there exist \(\varepsilon > 0\) and sequence \(\{\zeta(m)\}\) and \(\{\xi(m)\}\) of natural numbers such that

\[ \zeta(m) > \xi(m) > m, \]

\[ V_{cb}(\alpha_{\zeta(m)}, \alpha_{\xi(m)}) > \varepsilon, \]

\[ V_{cb}(\alpha_{\zeta(m)-1}, \alpha_{\xi(m)}) < \varepsilon, \quad \forall n \in \mathbb{N}. \]

(18)

Therefore, we derive

\[ \varepsilon < V_{cb}(\alpha_{\zeta(m)}, \alpha_{\xi(m)}) < s\left( V_{cb}(\alpha_{\zeta(m)}, \alpha_{\xi(m)-1}) + V_{cb}(\alpha_{\zeta(m)-1}, \alpha_{\xi(m)}) \right) \]

\[ - V_{cb}(\alpha_{\zeta(m)-1}, \alpha_{\xi(m)-1}) \]

\[ < sV_{cb}(\alpha_{\zeta(m)}, \alpha_{\xi(m)-1}) + sV_{cb}(\alpha_{\zeta(m)-1}, \alpha_{\xi(m)}) \]

\[ < sV_{cb}(\alpha_{\xi(m)}, \alpha_{\xi(m)-1}) + s \varepsilon. \]

(19)

Using (16), we derive

\[ \varepsilon < \lim_{m \to \infty} \inf V_{cb}(\alpha_{\zeta(m)}, \Xi \alpha_{\xi(m)}) < \varepsilon, \quad \forall m > M. \]

(20)

From (16), there exists \(M \in \mathbb{N}\) such that \((1/2s)Y_{cb}(\alpha_{\zeta(m)}, \Xi \alpha_{\xi(m)}) < \varepsilon, \forall m > M\), and using (18), we derive

\[ \frac{1}{2s}Y_{cb}(\alpha_{\zeta(m)}, \Xi \alpha_{\xi(m)}) < \frac{1}{2s}Y_{cb}(\alpha_{\zeta(m)-1}, \alpha_{\xi(m)+1}) \]

\[ = Y_{cb}(2\alpha_{\xi(m)}, \Xi \alpha_{\xi(m)}), \quad \forall m > M. \]

(21)

Therefore, from (C3), for every \(m > M\), we obtain
Hence, from (C₂), we derive

\[
\gamma_{cb}(\alpha(m), \alpha(m)) \gamma_{cb}(\Xi \alpha(m), \Xi \alpha(m)) \leq \frac{1}{2 s^2} \left[ \gamma_{cb}(\alpha(m), \alpha(m)) \right]^2 + \frac{1}{2 s^2} \gamma_{cb}(\alpha(m), \alpha(m)) \gamma_{cb}(\Xi \alpha(m), \alpha(m)) \\
+ \frac{1}{2 s^2} \gamma_{cb}(\alpha(m), \alpha(m)) \gamma_{cb}(\alpha(m), \Xi \alpha(m)).
\]  

(23)

From (16)–(23), we obtain

\[
\epsilon^2 < \lim_{m \rightarrow \infty} \sup \left[ \gamma_{cb}(\alpha(m), \alpha(m)) \gamma_{cb}(\alpha(m+1), \alpha(m+1)) \right] \\
< \lim_{m \rightarrow \infty} \sup \left[ \frac{1}{2 s^2} \left[ \gamma_{cb}(\alpha(m), \alpha(m)) \right]^2 + \frac{1}{2 s^2} \gamma_{cb}(\alpha(m), \alpha(m)) \gamma_{cb}(\Xi \alpha(m), \alpha(m)) n \\
+ \frac{1}{2 s^2} \gamma_{cb}(\alpha(m), \alpha(m)) \gamma_{cb}(\alpha(m), \Xi \alpha(m)) \right] n \\
< \frac{1}{2 s^2} (\epsilon^2) = \frac{1}{2} \epsilon^2 < \epsilon^2,
\]  

(24)

which is impossible. Hence, \( \lim_{m \rightarrow \infty} \gamma_{cb}(\alpha(m), \alpha(m)) = 0 \). By completeness of \((\Theta, \gamma_{cb})\), there exists \( \alpha \in \Theta \) such that

\[
\gamma_{cb}(\alpha, \alpha) = \lim_{m \rightarrow \infty} \gamma_{cb}(\alpha(m), \alpha) = \lim_{m, n \rightarrow \infty} \gamma_{cb}(\alpha(m), \alpha(n)) = 0.
\]  

(25)

We shall prove that, for every \( m \in \mathbb{N} \),

\[
\frac{1}{2 s} \gamma_{cb}(\alpha(m), \Xi \alpha(m)) \leq \gamma_{cb}(\alpha(m), \alpha).
\]  

(26)

or

\[
\frac{1}{2 s} \gamma_{cb}(\Xi \alpha(m), \Xi^2 \alpha(m)) \leq \gamma_{cb}(\Xi \alpha(m), \alpha).
\]  

(27)

Suppose not, we assume that there exists \( q \in \mathbb{N} \) such that

\[
\frac{1}{2 s} \gamma_{cb}(\alpha(q), \Xi \alpha(q)) \geq \gamma_{cb}(\alpha(q), \alpha),
\]  

(28)

which is impossible. Hence, (25) and (26) holds. From (25), we obtain

\[
\gamma_{cb}(\alpha(m), \alpha) \gamma_{cb}(\Xi \alpha(m), \Xi \alpha) \leq \tau_1 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \alpha) \\
+ \tau_2 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_3 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\Xi \alpha(m), \alpha) \\
+ \tau_4 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_5 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_6 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_7 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_8 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_9 \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha) \\
+ \tau_{10} \left( \gamma_{cb}(\alpha(m), \alpha) \right) \gamma_{cb}(\alpha(m), \Xi \alpha)
\]  

(29)
Using (25) and (26), we derive

\[ + \tau_3 (\chi_{cb}(a, a)) \chi_{cb}(a, a) \]
\[ + \tau_3 ((\chi_{cb}(a, a)) \chi_{cb}(a, a)) \]
\[ \leq t_1 (\chi_{cb}(a, a)) \chi_{cb}(a, a) \]
\[ + [s \tau_2 (\chi_{cb}(a, a)) + \tau_4 (\chi_{cb}(a, a))] \chi_{cb}(a, a) \]
\[ + [s \tau_2 (\chi_{cb}(a, a)) + \tau_5 (\chi_{cb}(a, a))] \chi_{cb}(a, a) \]
\[ + [\tau_3 (\chi_{cb}(a, a)) + \tau_5 (\chi_{cb}(a, a))] \chi_{cb}(a, a). \]  

(30)

From (12), we derive

\[ \chi_{cb}(a, a) \leq \chi_{cb}(a, a) + \chi_{cb}(a, a) \]
\[ + \chi_{cb}(a, a) + \chi_{cb}(a, a) \]
\[ \leq [s \tau_2 (\chi_{cb}(a, a)) + \tau_4 (\chi_{cb}(a, a))] \chi_{cb}(a, a) \]
\[ + [s \tau_2 (\chi_{cb}(a, a)) + \tau_5 (\chi_{cb}(a, a))] \chi_{cb}(a, a) \]
\[ + [\tau_3 (\chi_{cb}(a, a)) + \tau_5 (\chi_{cb}(a, a))] \chi_{cb}(a, a). \]

(31)

Using (25) and (26), we derive

\[ \lim_{m \to \infty} \chi_{cb}(a, a) = 0. \]

(32)

Since

\[ \chi_{cb}(a, a) < s[\chi_{cb}(a, a) + \chi_{cb}(a, a)] - \chi_{cb}(a, a) \]
\[ < s[\chi_{cb}(a, a) + \chi_{cb}(a, a)] \]
\[ = s \chi_{cb}(a, a) + s \chi_{cb}(a, a), \]

(33)

using (25) and (32), we get \( a = a. \) From (27), we obtain

\[ \chi_{cb}(a, a) \leq \chi_{cb}(a, a) + \chi_{cb}(a, a) \]
\[ + \chi_{cb}(a, a) + \chi_{cb}(a, a) \]
\[ \leq [s \tau_2 (\chi_{cb}(a, a)) + \tau_4 (\chi_{cb}(a, a))] \chi_{cb}(a, a) \]
\[ + [s \tau_2 (\chi_{cb}(a, a)) + \tau_5 (\chi_{cb}(a, a))] \chi_{cb}(a, a) \]
\[ + [\tau_3 (\chi_{cb}(a, a)) + \tau_5 (\chi_{cb}(a, a))] \chi_{cb}(a, a). \]

(34)
which means that

\[
\gamma_{cb}(\Xi^2 a_m, \Xi a) < \frac{\tau_1(\Xi a_m, \alpha)\gamma_{cb}(\Xi a_m, \alpha)}{\gamma_{cb}(\Xi a_m, \alpha) - s \tau_2(\gamma_{cb}(\Xi a_m, \alpha)) - s \tau_5(\gamma_{cb}(\Xi a_m, \alpha))} + (s \tau_2(\gamma_{cb}(\Xi a_m, \alpha)) + s \tau_5(\gamma_{cb}(\Xi a_m, \alpha)))\gamma_{cb}(\Xi^2 a_m, \Xi^2 a) + \gamma_{cb}(\Xi a_m, \alpha) - s \tau_2(\gamma_{cb}(\Xi a_m, \alpha)) - s \tau_5(\gamma_{cb}(\Xi a_m, \alpha))
\]

From (12) and (35), we derive that
\[
0 < \gamma_{cb}(\Xi^2 a_m, \Xi a) < \gamma_{cb}(\Xi a_m, \alpha) + \gamma_{cb}(\Xi^2 a_m, \Xi a) + \gamma_{cb}(\alpha, \Xi a_m).
\]

(36)

Using (16) and (25), we derive
\[
\lim_{m \to \infty} \gamma_{cb}(\Xi^2 a_m, \Xi a) = 0.
\]

(37)

Since
\[
\gamma_{cb}(\alpha, \Xi a) < s\left[\gamma_{cb}(\alpha, \Xi^2 a_m) + \gamma_{cb}(\Xi^2 a_m, \Xi a)\right] - \gamma_{cb}(\Xi^2 a_m, \Xi^2 a_m) - s\left[\gamma_{cb}(\alpha, \Xi^2 a_m) + \gamma_{cb}(\Xi^2 a_m, \Xi a)\right],
\]

using (25) and (37), we get \(\alpha = \Xi a\).

Example 2. Let \(\Theta = \mathbb{N} \cup \{r + (1/j + 3): r, j \in \mathbb{N}\}\). Define \(\gamma_{cb}: \Theta \times \Theta \to \mathbb{C}^+\) by

\[
\frac{1}{2}\gamma_{cb}\left(r + \frac{1}{j + 3}, \Xi\left(r + \frac{1}{j + 3}\right)\right) = \frac{1}{2}\gamma_{cb}\left(r + \frac{1}{j + 3}, 8r + \frac{1}{j + 3}\right)
\]

\[
= \frac{1}{2}\left(\max\left[r + \frac{1}{j + 3}, 8r + \frac{1}{j + 3}\right]^2 + \left|\frac{1}{j + 3} - 8r - \frac{1}{j + 3}\right|^2 + i\left(\max\left[r + \frac{1}{j + 3}, 8r + \frac{1}{j + 3}\right]^2 + \left|\frac{1}{j + 3} - 8r - \frac{1}{j + 3}\right|^2\right)\right)
\]

\[
= \frac{1}{2}\left(8r + \frac{1}{j + 3}\right)^2 + 49r^2 + i\left(8r + \frac{1}{j + 3}\right)^2 + 49r^2
\]

\[
= \frac{1}{2}\left(113r^2 + \frac{1}{(j + 3)^2} + \frac{16r}{j + 3} + i\left(113r^2 + \frac{1}{(j + 3)^2} + \frac{16r}{j + 3}\right)\right).
\]

\[
\gamma_{cb}\left(r + \frac{1}{j + 3}, j + \frac{1}{j + 3}\right) = \max\left[r + \frac{1}{j + 3}, j + \frac{1}{j + 3}\right]^2 + \left|\frac{1}{j + 3} - j - \frac{1}{j + 3}\right|^2
\]

Define a mapping \(\Xi\) on \(\Theta\) by

\[
-10\pi \Xi (r) = 2, \quad r \in \mathbb{N},
\]

\[
8r + \frac{1}{j + 3}, \quad r \in \left\{r + \frac{1}{j + 3}: r, j \in \mathbb{N}\right\}.
\]

(40)

Then, \(\Xi\) satisfies in the assumption of Theorem 2.

Proof. It is clear that \((\Xi, \gamma_{cb})\) is a complete complex partial b-metric space with coefficient \(s = 2^5\) and 2 is a unique fixed point of \(\Xi\). Let \(j < r\):

\[
\gamma_{cb}(r, j) = \max\{r, j\}^2 + |r - j|^2 + i\left(\max\{r, j\}^2 + |r - j|^2\right).
\]

(39)
\[ + i \left( \max \left\{ r + \frac{1}{j + 3}, j + \frac{1}{j + 3} \right\}^2 + |r + \frac{1}{j + 3} - j - \frac{1}{j + 3}|^2 \right) \]

\[ = \left( r + \frac{1}{j + 3} \right)^2 + |r - j|^2 + i \left( \left( r + \frac{1}{j + 3} \right)^2 + |r - j|^2 \right) \]

\[ < r^2 + \frac{1}{(j + 3)^2} + \frac{2r}{j + 3} + (|r| - |j|)^2 \]

\[ + i \left( r^2 + \frac{1}{(j + 3)^2} + \frac{2r}{j + 3} + (|r| - |j|)^2 \right) \]

\[ < r^2 + \frac{1}{(j + 3)^2} + \frac{2r}{j + 3} + (|r| + |j|)^2 \]

\[ + i \left( r^2 + \frac{1}{(j + 3)^2} + \frac{2r}{j + 3} + (|r| + |j|)^2 \right). \]

So, for \( j < r, \) \((1/2)\gamma_{cb}(r + (1/j + 3), \Xi(r + (1/j + 3))) \\& \gamma_{cb}(r + (1/j + 3), j + (1/j + 3)).\) Therefore, \( \Xi \) satisfies all the conditions of Theorem 2. \( \square \)

### 3.1. Nonlinear Integral Equations

In this section, we prove the existence and uniqueness of a solution for nonlinear Fredholm integral equations by using Theorem 2.

**Theorem 3.** Consider the nonlinear Fredholm integral equation:

\[ r(t) = j(t) + \int_a^b K(t, s, r(s))ds, \]  (42)

where \( a, b \in \mathbb{R} \) with \( a < b \) and \( j: [a, b] \to \mathbb{R} \) and \( K: [a,b]^2 \times \mathbb{R} \to \mathbb{R} \) are given continuous mappings. Suppose that the following condition holds:

(a) The mapping \( \Xi: C[a, b] \to C[a, b] \) defined by \( (\Xi r)(t) = j(t) + \int_a^b K(t, s, r(s))ds \) for all \( r \in C[a,b] \) and \( t \in [a, b]. \)

Then, the nonlinear integral equation (42) has a unique solution.

**Proof.** Let \( \Theta = C[a, b]. \) Clearly, \( \Theta \) with the complex partial \( b \)-metric \( \gamma_{cb}: \Theta \times \Theta \to \mathbb{C} \) given by

\[ \gamma_{cb}(r(t), v(t)) = \max \{r(t), v(t)\}^2 + i \max \{r(t), v(t)\}^2, \quad t \in [a, b], \]  (43)

for all \( r, v \in \Theta \) is a complete complex partial \( b \)-metric space. Without loss generality, we may assume that

\[ r < v \Rightarrow r(t) \leq v(t), \quad \forall t \in [a, b]. \]  (44)

Now,

\[ \frac{1}{2s} \left( \left( j(t) + \int_a^b K(t, s, v(s)) \right)^2 + i \left( \left( j(t) + \int_a^b K(t, s, v(s)) \right)^2 \right) \right) \]

\[ < \left( j(t) + \int_a^b K(t, s, v(s)) \right)^2 + i \left( \left( j(t) + \int_a^b K(t, s, v(s)) \right)^2 \right). \]  (45)

Therefore,

\[ \frac{1}{2s} \gamma_{cb}(v(t), \Xi v(t)) < \gamma_{cb}(r(t), v(t)). \]  (46)

Hence, \( \Xi \) satisfies all the conditions of Theorem 2. \( \square \)

### 4. Conclusion

In the present work, we presented a new fixed point theorem for self-mappings defined on complex partial \( b \)-metric. We illustrated our main theorem by an example and showed, moreover, that the main theorem can be easily used to solve a nonlinear integral equation.
