Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.
Improvising resilience: The unfolding of resilient leadership in COVID-19 times

ARTICLE INFO

Abstract

The spread of the COVID-19 pandemic in Italy has had disastrous effects on the national economy. The hospitality sector has experienced a significant impact from the crisis: starting from March 2020 it has literally collapsed. Experts believe it will take three years for the sector to recover. Confronted with a dramatic uncertainty, which imposed rapid action, hospitality leaders need to nurture resilience. To enrich current understanding of the way resilient leadership unfolds to respond to jolts, we draw on an exploratory qualitative research involving Italian hotel managers. Following in-depth interviews, we show that resilient leadership and improvisation are deeply interconnected. Their interdependence entails two practices, namely gardening and reaping. This suggests a paradoxical tension: to exercise resilience, leaders need to be at the same time inside and outside the system, by actively learning from events, and in accordance with their capacity for resilience. They need to simultaneously look at the details and the big picture, by zooming in and out as they focus on ongoing planning and decision making to cultivate such resilience (see Renjen, 2020). A variety of factors need to come into play to make leadership resilient (Giustiniano et al., 2020). However, research on this issue is still in its infancy, with most of studies focusing on the relationship between different leadership styles and the employee’s resilience (Harland et al., 2005; Sommer et al., 2016) rather than on the mechanisms for stimulating organisational resilience.

1. Introduction

The Organization for Economic Co-operation and Development (OECD) defined COVID-19 pandemic as the worst crisis since the second world war. Being one of the countries that have been worst hit by the virus, Italy quickly went into lockdown, causing inestimable losses for the whole country (La Repubblica, 2020).

More than others, the hospitality sector has suffered the most immediate repercussions of the pandemic. The measures for transmission containment that were prompted by the government and the fear of travelling that has spread internationally have stopped any event, conference, convention, sports league, and have drastically driving down tourism for both business and leisure. According to ENIT estimate, tourism is not expected to recover until 2023.

This extreme event, including its residual duration and the extension of its aftermath, will have important implications for organisation design (Foss, 2020) and its practice. This calls for the expression of resilience at several organisational levels, and leaders need to be able to cultivate such resilience (see Renjen, 2020). A variety of factors need to come into play to make leadership resilient (Giustiniano et al., 2020). However, research on this issue is still in its infancy, with most of studies focusing on the relationship between different leadership styles and the employee’s resilience (Harland et al., 2005; Sommer et al., 2016) rather than on the mechanisms for stimulating organisational resilience.
COVID-19 has crafted a “new normal” that carried important social implications and evident organisational costs, calling leaders to fast action of the improvised type (i.e. planning resilience-building actions) while needing to do it improvisationally (i.e. together with the planning) (Ciuchta et al., 2020; Moorman and Miner, 1998). To this extent, the pandemic has offered a generalised extreme case for elaborating a comprehensive theoretical grounding on how leaders can use improvisation to stimulate resilience within their organisations.

Given the disastrous impact that COVID-19 has had on Italian tourism, we consider that the case of hospitality in Italy can be instructive for developing an enriched understanding of how resilient leadership unfolds in the presence of environmental jolts. Accordingly, in this paper we seek to explore the process through which Italian hospitality managers exercise resilience by answering the following research question: How do hospitality leaders improvise resilience in practice while facing the shock caused by COVID-19?

We conducted an exploratory qualitative research on a sample of Italian hotel managers. Following in-depth interviews, we found that two main practices are involved in the improvisation of resilience: an element of ongoing preparation, which we metaphorically called “gardening”; and the capacity to learn as the crisis unfolded. These two practices imply a state of synergistic paradoxical tension between being an actor in the system to learn from events and being a spectator of the system to avoid being submerged by the events (Heifetz and Linsky, 2002). This paradoxical state of zooming in and out, working directly and indirectly, may lie at the core of resilient leadership.

2. Literature review

2.1. Resilience: definition and major dimensions

The frequent rapid changes occurring in the business environment together with the significant events distinguishing the recent political, social, and economic global scenarios make the understanding of resilience more critical than ever (Coutu, 2002). Consequently, research on resilience has attracted substantial attention from scholars with remarkable reviews and many empirical papers have appeared in major journals (see, for instance, Crane and Searle, 2016; Fisher et al., 2019; Hartmann et al., 2020; Kossek and Perrigino, 2016; Linnenluecke, 2017; Williams et al., 2017). Resilience implies a complex network of variables and it defines the capacity to absorb adversity, trauma, external shocks, or any significant sources of stress, while learning from them, preparing and responding to changes (Giustiniano et al., 2018). Therefore, being resilient denotes one getting knocked down and then getting up again, learning from events and being ready to face future challenges.

Most research has investigated resilience as a personal characteristic (‘resiliency’) or a static feature of collective groups or organisations (Wanberg and Banas, 2000). In contrast, in this paper we consider it as a process that helps individuals and organisations learn and feed their self-development over time. Thus, resilience is rather about “how a person weatheres a storm and the learning that results, how he or she deals with a major loss, and the processes that lead to personal choices […] and personal growth and integrity” (King and Rothstein, 2010, p. 365). In so doing, conceptualising resilience as a process places emphasis on reaching and maintaining a positive adaptation, despite experiencing adversity (Rak and Patterson, 1996).

In investigating resilience as a process, scholars have proposed it as being comprised of two different yet interrelated dimensions: adaptive and reactive resilience (Giustiniano et al., 2018). The former defines the capacity to absorb the impact by single-loop learning and first-order change; that is, to value, transform, and use knowledge for adaptive goals. As such, adaptive resilience manifests itself as an expression of absorptive capacity, as proposed by Zabre and George (2002). In contrast, reactive resilience refers to the ability to look at shocks and negative incidents as sources of learning and growth at different organisational levels, thus drawing attention to the cultivated preparedness to cope with changes and the ability to adopt new practices as a consequence of experiencing the difficulty. The reactive component thus results in a double loop learning, requiring the organisation or the individual to reflect on the actions to be adopted and to incorporate this learning in their current practices.

More than conceptual dimensions, adaptive and reactive resilience embody two major conceptual templates (Langley, 1999); that is, theory-driven interpretations of the phenomenon, based on “different but internally coherent sets of a priori theoretical premises” (p. 698).

Despite the richness of extant research on resilience and leadership, the necessity to infuse leadership with resilience and the call for its synthesis has been triggered by COVID-19 (e.g. Renjen, 2020). Nonetheless, despite some preliminary intuition (Giustiniano et al., 2020), resilient leadership lacks a comprehensive understanding of the mechanisms that leaders may activate to exercise resilience in the presence of severe adversities. In the next sections, we will explore improvisation as a fundamental component of facing adversity (Weick, 1993). We will also offer a tentative, initial conceptualisation of resilient leadership. This will provide a preliminary ground to our exploratory research in the hospitality industry during the spread of COVID-19 pandemic.

2.2. Improvisation and resilience

When confronted with a trauma or a more general source of stress, instead of acting following a meticulous plan, individuals are more likely to adjust to adversities as they emerge (Miner et al., 2001). Given that shocks and crises are difficult to predict, individuals are required to express a capacity for improvisation to successfully face and manage them (Vogus and Sutcliffe, 2012; Weick, 1993). Hence, improvisation includes the need to respond to the unexpected in the moment, to adapt effectively to sudden changes, thereby expressing reactive and adaptive features (Abrantes et al., 2018). Accordingly, improvisation helps organisations respond to crises without the benefit of planning. Instead of either relying on standard procedures or waiting instructions from the hierarchical command system, improvisation reacts to threats by emphasising openness, flexibility, autonomy, and the appreciation for impromptu action (Barrett, 2012). Consequently, improvisation is considered a ‘core skill’ of resilient organisations (Coutu, 2002).

Resilience and improvisation appear to be strictly related, yet different, concepts. As argued by Giustiniano et al. (2018), improvisation is the capacity to respond in the absence of planning with the available rather than with the optimal resources (Ciuchta et al., 2020; Cunha et al., 1999; Hadida et al., 2015). Therefore, it can occur in isolation; that is, it can be a one-off process, responding to an event without necessarily contributing to foster resilience. More importantly, not all unplanned actions derive from improvisation because it excludes random change, entailing a deliberate new design. As contended by Cunha et al. (1999), for improvisation to occur, at least three components should be present: first, the convergence of design and performance (i.e. extemporaneity); second, the creation of some degree of novel action (i.e. novelty); and third, the deliberateness of the design that is created during its own enactment (i.e. intentionality).

In defining improvisation as a key component of resilience, Hadida et al. (2015) further clarify the levels at which it may happen. Individual-level improvisation occurs within a single actor, when one adjusts her own work in real time to emerging information or is “stretched beyond […] routines to deliver a novel solution to a problem” (p. 447). Interpersonal improvisation transcends individuals, taking place in small teams where adjustments and responses result from multilateral actions, such as inputs coming from one team member that activate brainstorming and ideas within the overall team. Finally, improvisation at the organisational level “refers both to the ability of the whole organisation to improvise and to the institutionalization of structures or practices that enable or lead to improvisation within the organisation” (p. 448). Furthermore, Hadida et al. (2015) distinguish between different degrees at which improvisation can occur: minor,
bounded, or structural degree. Minor improvisation relates to performing existing tasks in a different way, pointing to model adjustments to pre-existing processes. Bounded improvisation takes place when one improvises a different task targeting the same outcome (e.g. improvising novel processes or products within existing structures). In contrast, structural improvisation involves accomplishing a different task toward a different, new outcome. In so doing, it refers to radical innovations, such as redefining the mission or the business strategy.

2.3. Resilient leadership

Scholars agree that resilience is key to leadership (King and Rothstein, 2010). Given that leaders are expected to guide the team toward a purpose, to encourage the employee’s development, and instil a sense of engagement and commitment, their contribution to organisational performance is likely to be essential in times of crises. Hence, when confronted with failure or harsh conditions, leaders need to understand these contingencies and how to handle them. Their capacity to bounce back from adversity is vital to the organisation’s restart and future success. More importantly, by virtue of their ability, leaders can exert their influence over their followers, shaping their behaviours and influencing them toward the achievement of a certain goal (Danesreau et al., 2013), such as being resilient and recovering from jobs.

As resilience in general, resilient leadership cannot be imposed from the top or deterministically designed ex ante (Giustiniano et al., 2020). Moreover, the sheer presence of resilience (e.g. a resilient leader) does not necessarily imply its propagation (e.g. to the followers). As argued by Giustiniano et al. (2018), for resilience to escalate to higher levels of aggregation (e.g. from the individual to the team), it must be expressed by individuals, conveyed towards the others and perceived by the receivers. Research suggests that resilient leaders can play a critical role in spreading resilience: they are likely to respond to jobs through a process of adaptation and growth; that is, through a dynamic combination of divergent elements, such as “preparedness and improvisation, clear direction-setting and flexibility” (Giustiniano et al., 2020, p. 2). Effective leaders are therefore strategic to the diffusion of resilience because they enable a process of ‘learning to unlearn and learn’ (Giustiniano et al., 2020), struggling to find a balance between reaction and adaptation, and transforming stressors and shocks into new energy. As in the case of Rudy Giuliani, the former mayor of New York City, who efficiently faced the 9/11 attacks, resilient leaders can help their organisations to prosper despite adversities (James and Wooten, 2010). Thanks to Giuliani’s leadership, even for a short time, the United States embraced New York City, for once forgetting about political differences and past grievances. Thus, given the inherent challenge of responding to crises with a command-and-control approach, fostering and nurturing resilience requires a strong will and ability of organisational leaders to develop new norms (James et al., 2011; Williams et al., 2017).

Similar to the other qualities that may be referred to individuals, teams and organisations (e.g. grit; see Rego et al., 2020), the synthesis between resilience and leadership is not immune from unexpected side effects. One is the creation of an organisational culture that stigmatises individuals who are poor in resilience as flawed and faulty (the so-called “shadow side to resilience”; Adler, 2013; Britt et al., 2016), leading to a sense of “citizenship fatigue” (Bolino et al., 2015). This can then inhibit the employee’s help seeking behaviours, repressing the dynamic learning process that underlies resilient leadership. Similarly, an extreme concern for resilience may induce people to become overly tolerant of adversity, such as accepting dangerous working conditions or toxic bosses (Giustiniano et al., 2018), as well as to lower their attention toward changing the environment to diminish their exposure to adversity (Jeddeloh et al., 2011; Krueger, 2011). Furthermore, individuals who strive to become too resilient might suffer from the “false hope syndrome” (Polivy and Herman, 2000): a phenomenon according to which, even where there is clear evidence that certain goals are unlikely to be achieved, overconfidence and overoptimism can lead individuals to waste energy and effort on meaningless tasks.

So far, the construct of resilient leadership has been found to be applicable to a variety of contexts, such as the healthcare sector (Kim and Windsor, 2015), military service (Mjelde et al., 2016), the management of natural disasters (Cohen et al., 2017), post-mergers and acquisitions integration (Cooke et al., 2020), and the hospitality industry (Haver et al., 2014). Nonetheless, the issue of how leaders exercise resilience remains underexplored empirically. Most of the studies on the theme have investigated the relationship between leadership styles and the follower’s resilience (Sommer et al., 2016; Harland et al., 2005), and the effect of a leader’s resilience on the employee’s work performance (Avey et al., 2011). Others have focused on single factors that are likely to foster a leader’s resilience (e.g. individual, situational, or behavioural factors; see Foerster and Duchek, 2017). Therefore, given the inherent complexity distinguishing the concept of resilience, the leader’s ability to cope with adversity is likely to emerge as a result of a complex holistic process that, instead of a scattered collection of possible features, requires a more comprehensive understanding of how it unfolds in context and in relation (Giustiniano et al., 2020; Uhl-Bien et al., 2007).

3. Research context

The hospitality industry accounts for approximately 60 % of the whole tourism industry in Italy (Mordor Intelligence, 2019). Until February 2020, it was yielding increasing revenues. This was also due to the more general expansion of the tourism industry in Italy, which in 2018 welcomed around 60 million tourists, recording a growth of 100 billion euro. In 2019, the contribution of tourism to the Italian GDP was estimated to be around 237 billion euros (13.3 % of the overall GDP) and it was expected to reach 14.3 % in 10 years (World Travel & Tourism Council (WTTC), 2020). In terms of hotels and available rooms, Italy is currently the first country in Europe and the fourth in the world with around 33 thousand hotels and 1 million rooms, behind only by the United States, China, and Japan (Ribaudo and Franzese, 2019). Alongside this, new independent hotels, hotel chains, branded hotels have appeared throughout the country and the number of employees working for tourism and hospitality has increased dramatically: from 950 thousand employees in 2014 to 1.17 million in 2018 (Federazione delle Associazioni Italiane Alberghi e Turismo 2020).

This sector has been hit by COVID-19, as one could have never foreseen. The impact has been even more severe given that Italian hospitality relies strongly on international demand, which offsets domestic demand. While the latter has only slightly changed over the last 10 years, foreign customers have increased by 20 % (Ribaudo and Franzese, 2019), registering a rise of 15 million visitors between 2013 and 2018 (World Travel & Tourism Council (WTTC), 2020).

Due to the pandemic, as reported by Confaturismo (the Italian tourism confederation), Italy lost about 30 million tourists between March and May 20202. In addition, the virus spread while hotels were preparing for the peak season, the Easter holiday, and the summertime. This led both tourists and corporate trips to cancel their reservations, even for September. Moreover, considering the variety of related businesses that depend on tourism (e.g. restaurants, shops, etc.), by the end of 2020 the total loss is expected to be around 200 billion euros, with a decrease of roughly 28.5 million tourist arrivals (Demoskopika, 2020) and catastrophic job losses, which are estimated at around 2.8 million. In particular, hotel and nonhotel accommodations are expected to experience the highest loss and their revenues might have decreased by 13 billion euros compared to the first semester of 2019 (17 billion euros).

Recent estimates from the World Tourism Organization (UNWTO, 2020) calculate that there will be a rebound in tourism across Europe by

---

2 Compared to the same period of 2019, the loss is about 48 million tourist arrivals if considered between January and August 2020.
4.2. Respondents and data collection

reached. In particular, after the 11th interview, it was deemed that the data collection had reached saturation point.

Based on this, we consider the Italian hospitality industry to be highly suitable to investigate the way in which hospitality managers are trying to improvise resilience to cope with the shock produced by COVID-19 pandemic. In the following section, we will present the qualitative research that we conducted to explore this issue.

4. Methodology

4.1. Research design

Given the need to collect unique insights on an extraordinary phenomenon (i.e. the COVID-19 pandemic) and its shocking consequences for the Italian hospitality sector, this study has adopted a qualitative research method. As advocated by scholars (e.g. Kozinets, 2010), qualitative research aims to explore a complex set of factors regarding a central phenomenon to depict the varied views or meanings held by the actors experiencing such a phenomenon. In so doing, it provides the basis for understanding new theories that might help to explain the phenomenon, letting new and inspiring perspectives emerge.

4.2. Respondents and data collection

To investigate hospitality resilience, exploratory interviews with hotel managers and general managers working in the tourism industry in Italy were conducted. Following Corbin and Strauss (2014), we continued collecting data until we judged that theoretical saturation was reached. In particular, after the 11th interview, 80 % of the categories were identified. We therefore continued data collection for three more interviews, which helped to detect 90 % of the categories. We then conducted three additional interviews and found that they helped to generate the remaining 10 % of the categories. However, one last interview was added to ensure that data saturation was achieved. Thus, after 18 interviews no incremental benefit was brought, so it was deemed that the data collection had reached saturation point.

Due to the very short time window available, and the need to gather thoughts and opinions exactly during the crisis caused by COVID-19, all of the interviews were conducted over a three-week period between May and June 2020. For the purpose of this study, a combination of convenience and purposive sampling was used (Marshall, 1996). First, through convenience sampling, hotel managers who were in the personal network of the principal investigator of this study were contacted. Next, snowball sampling allowed us to involve further participants through recommendations provided by the recruited interviewees. Second, to increase the representation of the sample selected, purposive sampling was applied (Wan and Chan, 2013). In particular, LinkedIn helped the researchers to identify additional hotel managers by searching for contacts who reported “hotel manager” or “general manager of hotel” in their profile.

Before participating in the interview, each respondent was informed about the purpose of the study and its exploratory nature. We also asked for their permission to tape the interview, ensuring that the data collected was for research purposes only.

Two main issues required to involve hotel managers working in different cities and towns in Italy (in the North, in the Centre, and in the South). First, some Italian cities (i.e. Milan) were hit harder by the COVID-19 than others. The inclusion of respondents leading hotels in different regions and cities allowed us to capture the heterogeneity in their perception of the shock and the consequent actions that they took. Second, consistently with the different ways in which the virus spread across the country, both the lockdown restrictions and the decisions regarding the reopening taken by the regional presidents differed across regions. For instance, rules that applied in Lombardy (one of the Northern regions) were much stricter than those imposed in Calabria (one of the Southern regions)3. This might have influenced the way in which their leaders tried to cope with the crisis by COVID-19.

Table 1 shows the demographics of the interviewees. Reflecting the gender imbalance that distinguishes hospitality (Pinar et al., 2011), there were 3 women and 15 men. Eight of them were between 50–59 years old, other eight were between 40–49 years old (47 %) and the remaining two were between 60 and 69 years old. To include different hotel types, we involved city hotels, resorts, relais and chateau, beach hotels and country hotels. Regarding the hotel ratings, Table 1 shows that our sample includes hotels from 3 to 5 luxury stars.

| Code | Gender | Age | Hotel type | Hotel rating | Position          |
|------|--------|-----|------------|--------------|------------------|
| 01   | Male   | 50–59| Resort     | 4-star       | General Manager  |
| 02   | Male   | 60–69| City hotel | 5-star       | General Manager  |
| 03   | Male   | 50–59| Beach hotel| 4-star       | Hotel Manager    |
| 04   | Male   | 40–49| Beach hotel| 3-star       | Hotel Owner and Manager |
| 05   | Male   | 40–49| City hotel | 4-star       | Hotel Manager    |
| 06   | Female | 40–49| City hotel | 4-star       | Hotel Manager    |
| 07   | Male   | 50–59| City hotel | 3-star       | General Manager  |
| 08   | Male   | 40–49| City hotel | 4-star       | Hotel Manager    |
| 09   | Male   | 60–69| City hotel | 5-star       | General Manager  |
| 10   | Male   | 50–59| Resort     | 4-star       | General Manager  |
| 11   | Female | 50–59| Relais&Chateau | 4-star | Resident Manager |
| 12   | Male   | 50–59| City hotel | 4-star       | Hotel Manager    |
| 13   | Male   | 40–49| City hotel | 4-star       | Hotel Owner and Manager |
| 14   | Male   | 40–49| Resort     | 4-star       | General Manager  |
| 15   | Male   | 50–59| City hotel | 3-star       | Hotel Manager    |
| 16   | Male   | 50–59| Resort     | 4-star       | General Manager  |
| 17   | Female | 40–49| Country hotel | 4-star | General Manager |
| 18   | Male   | 40–49| Relais&Chateau | 5-star | General Manager |

3 Note for editors and reviewers: this study was deliberately conceived for the International Journal of Hospitality Management, Special issue on “The Impact of the COVID-19 Pandemic on the World’s Hospitality Industry”. Hence, the limited duration of the call for paper bounded both data collection and data analysis.

4 Lombardy was the region worst hit by the COVID-19 emergency that has had the toughest rules in place.
4.3. Interviews

Given the travel restrictions imposed by the pandemic, the interviews were conducted by phone (15) and videocalls (3). All of them were taped and lasted approximately 30 min. No incentive was given to any of the respondents for taking part in the study. Consistently with her expertise in running research in tourism, only one of the co-authors conducted all interviews.

Following the aim of the research to explore a completely new issue (i.e., hotel managers’ resilience during COVID-19), we decided to investigate the field by using in-depth, exploratory interviews (Packer, 2017) that allowed the respondents to address the subject freely by narrating incidents to support and enrich their answers. For the sake of high rigour, the answers that we collected during early interviews were useful to refine the protocol for the subsequent interviews (Eisenhardt and Graebner, 2007). The protocol was built around four main issues that were found to be key to explore the way in which leaders improvise responses and practice resilience. The first referred to the way in which leaders conceive resilience; that is, the way they interpret their role of change agents, of key individuals whose actions are fundamental in times of crisis. While investigating this issue, we aimed to understand whether participants conceived resilience, mostly either in its adaptive or reactive form (see Giustiniano et al., 2018). Even though they might appear as diverging perspectives, we acknowledge that resilience can be more effectively conceptualised as resulting from the dynamic interplay between these two forces. Furthermore, the first issue attempted to uncover the potential antecedents of individual resilience, both at the individual and at the contextual level. The second issue that we considered relevant to this study was the goals that the leaders set to cope with a shock, including the way in which they make decisions when presented with the need to solve a crisis. This issue recalled the analysis of the dominant approach followed by the leader when trying to bounce back from a jolt, such as an engineering approach (i.e. returning to the normal state after the disturbance has been handled; Holling, 1996) instead of an innovation-oriented approach (i.e. significantly revising internal procedures and ways of working). Furthermore, it directed attention toward the extent to which individuals improvise actions and decisions while practicing resilience. The third issue pointed to the way in which the leaders might perceive the crisis as a unique learning opportunity, a valuable chance to change the status quo and to enrich competences. In this regard, the literature on learning from failures (e.g. Baumard and Starbuck, 2005; Carmeli and Gittell, 2009) clearly posits that crises might bring exceptional opportunities to learn. More importantly, resilience might entail a process of ‘learning to learn’ (Andersen, 2016; Giustiniiano et al., 2018, 2020), thus requiring a completely new experimentation approach. Therefore, this issue called for an investigation of the leader’s optimism, hope, and positive outlook. Finally, the topic required us to examine whether and how the leaders contribute to the diffusion of resilience throughout the organisation. Acknowledging that resilience can be nurtured and spread within an organisational setting (Giustiniano et al., 2018), we aimed to capture what actions were put in place to allow resilience to proliferate. It has previously been shown that building positive interactions, being effectively connected to the external environment, and placing emphasis on self-organisation and a culture of ‘learnability’ (Garud et al., 2006) may be critical to let resilience diffuse.

The questions guiding the interviews were as follows:

1) “What does it mean to you to cope with the consequences of COVID-19?”
2) “While coping with those consequences, what goal(s) did you set for your hotel?”
3) “How do you think this crisis can be seen as an opportunity to learn, both for you as a hospitality professional and for the tourism industry?”
4) “How did you try to spread your approach to the crisis to your staff?”

Depending upon the participant’s answers, additional open-ended questions were posed to elucidate the issue. The interviewer only asked the second, third, and fourth questions when the respondent had nothing else to add or say about the previous issue. At the end of every interview, each participant was given the opportunity to comment on issues other than those addressed by the pre-set, open-ended questions. At this stage, the interviewer thanked the respondent and ended the interview. During the interview, the interviewer took detailed notes, highlighting any keywords the respondent mentioned more than once. All of the interviews were conducted in Italian and transcribed and translated into English for data analysis. Although all of interviews could have been conducted in English (all of the respondents were highly fluent in English), using Italian made it easier for both the interviewer and the participants to freely express their opinions on the topic.

4.4. Data analysis

To explore the phenomenon, we followed conventional recommendations for inductive qualitative analysis (Giota et al., 2013). In particular, we performed a qualitative content analysis (Schreier, 2012), which is found to be suitable when researchers attempt to make systematic and replicable inferences from texts to the research contexts (Maxwell, 2012; Wan and Chan, 2013). This allows to subjectively interpret the content of those texts through a systematic classification process (Hsieh and Shannon, 2005). By applying a content analysis, researchers tend to depict connections between categories and themes, increasing their ability to come up with a broad and condensed description of a particular phenomenon (Mak et al., 2010).

Following prior research (Kao et al., 2016; Tracey and Phillips, 2016), the analysis implemented in this study involved three steps. First, we collected all materials by transcribing all interviews within a database. Then, in line with Strauss and Corbin (1990) and Giota et al. (2013), to identify emerging and relevant themes, one co-author (who has been working in hospitality and tourism for a few years before joining academia) went through the data using an open-coding process by reading the transcriptions carefully line by line several times until she detected meaningful units. The segmentation of the material (i.e. the act of dividing it into units) followed a thematic criterion. As suggested by Schreier (2012), this is by far more effective than the formal criterion because it tends to ensure a better fit between each coding unit and the coding frame. Consistent with Kao et al. (2016), coding units with similar meanings were sorted into the same theme. In case a coding unit was considered to be unconnected to the already identified themes, it was treated as a new theme. In doing so, initial concepts were inductively detected and grouped into first-order categories, while always trying to retain the language used by the participants. The third step required us to perform an axial coding through which first-order categories are examined to seek similarities and differences among them using both inductive and deductive thinking (Corbin and Strauss, 2014; Giota et al., 2013; Tracey and Phillips, 2016). The aim was to reduce the relevant categories to a manageable number and to relate them to a group of second-order themes. This stage led us to iteratively move between the data and the relevant literature (Eisenhardt, 1989; Giota et al., 2013), having the framework of “resilience as practice” developed by Giustiniano et al. (2018) as a hook to the theory realm. Afterwards, all of the identified themes were labelled and examined once again to make sure they correctly reflected the domain of hospitality leaders’ resilience. Through this process, 39 first-order categories were classified into 11 s-order themes.

The member checking technique was used to support the trustworthiness of our data (Nag et al., 2007). Once completed, we returned the very first draft of the analysis to the interviewees and asked them for any feedback. More specifically, we invited them to indicate: (i) whether the overall results were consistent with their expectations and reflect their experiences, and (ii) whether they disagree with some of the findings. All of the participants confirmed the accuracy of the results and sent a
few inputs that led us to slightly revise the coding structure.

The resulting final data structure is illustrated in Fig. 1, which shows the categories and the themes underlying our findings and the relationships between them. Further supporting evidence for our results is reported in Table 2.

5. Findings

The refinement of the data analysis via the filters of the second-order themes allowed us to identify two major overarching dimensions: leadership as gardening and leading while learning. These dimensions are presented in more detail below, together with the quotes supporting...
| Aggregate dimension:       | First-order categories | Representative data                                                                                                                                   |
|---------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| a. AR - Purposing         | 1. Longer-term orientation | “We need a territorial marketing plan, that lifts the destination up again.”; “It’s time to think of a sustainable tourism development plan.” |
|                           | 2. Social responsibility | “A further purpose is the ethical and social one because we take care of our employees’ families.”; “I know this year I will not make any profit, but I aim to guarantee my employees their job.” |
|                           | 3. Assets               | “I know I am in a privileged situation because I didn’t have to manage serious cash flow issues.”; “Everything was supported by the owner’s ability to invest because nobody can afford it.” |
| b. AR – Planning          | 4. (Internal) Psychological safety | “…Always trying to take stock of the situation realistically.”; “We need to prepare ourselves not only by analysing and forecasting, but also reading the curves of the pandemic.” |
|                           | 5. Personnel morale     | “In this situation, it’s fundamental to keep morale high, work on people’s psychology, create an atmosphere of serenity, give hope.”; “I tried to keep the spirit of the collaborators up because they were in trouble […] It was about giving them the serenity they needed at that moment.” |
|                           | 6. (External) Psychological safety | “I am used to reassure above all.”; “We have to make sure that people who visited us in the past come back in complete safety.” |
|                           | 7. Crafting the new normal | “The goal is to return to our normality which was made up of incessant rhythms, moments of hard work.”; “Our challenge is to try to apply the new rules, the new protocols in the most transparent way possible to regain possession of the previous mode (we worked before).” |
|                           | 8. Survival             | “The goal is to reopen, which is not secondary, but is an important goal.”; “The main challenge is to keep the company going. So, try to survive.” |
|                           | 9. Metabolisation of the shock | “It is a tragic moment because there is no precedent, no one has a solution, or a past to lean on.”; “No one could ever have thought this could happen. So the shock was huge.” |
|                           | 10. Safeguard           | “We must be careful at this stage of transition regarding how far we go forward. I wouldn’t like to make investments with no return. we need to carefully evaluate the decisions to make.”; “We are in the corner, we must defend ourselves.” |
|                           |                        | “(We had) to manage (the hotel) on the basis of what we had […] with energy savings, efficiency, optimising the workforce, reorganising resources.”; “One always tries to optimise all costs […] I tried to save money.” |
|                           |                        | “Those who have sown well have a much better chance of overcoming this difficult time.”; “It also depends on how one has worked in the past 10 years.” |
|                           |                        | “I decided to build an extended team of people, from every department, because even through a simple brainstorming, ideas could come out and could help overcome the moment.”; “We must tighten the collaboration with the administrative and commercial staff.” |
|                           |                        | “I’ve always had a very transparent relationship with my employees.”; “I am used to explaining everything… for me the most important thing is to be transparent with them and communicate regularly.” |
|                           |                        | “There was everyone’s support, a clear spirit of participation.”; “To keep people together, we organised an English course, a sommelier course. So we tried to maintain the team together.” |
|                           |                        | “I struggle to explain (to the owners) that they no longer have to think as they used to think months ago. It is the most difficult part ever.”; “The board had certainties that were completely reversed by the relationship with the customers we had on site. And this caused stress because transmitting (the board) this information is not always easy.” |
|                           |                        | “I absolutely needed to confront myself with someone else.”; “We often talk to colleagues to know more about how bookings were evolving.” |
|                           |                        | “We are more or less settling on a rate, on a pricing idea, which will not be based on revenues, but on cancellation policy.”; “I think of some concessions to make to the customer, some benefits. I think, for instance, of something to give in the spa, the cocktail at the pool bar, room service.” |
|                           |                        | “All we have to be creative, we all try to think about what the best solution for sanitising spaces can be.”; “(We had to) improvise the hotel closure. I had never done it.” |

(continued on next page)

Table 2 (continued)

| Second-order themes | First-order categories | Representative data |
|---------------------|------------------------|---------------------|
| 20. Accelerating digitisation | “We must introduce different operating modes, with a push on technology and digitisation, but we don’t want to push it too much because we would lose what our hospitality was.”; “... An acceleration of digitisation. The tools were already there, but it was the customers who were late because they didn’t feel like undergoing digitisation. Moreover, ... the development of contactless in general and vocal services. So take a step into a slightly more digital era.” |
| 21. Reinventing the restaurant services | “For example, we had a huge buffet also with typical products. That will have to be completely revised. In practical terms, this means that guests will no longer be able to directly access the buffet, so it must be rethought trying not to take a step back, but maintaining the past service standards, despite what we offer changes.”; “[...] The menu at the restaurant ... One may think that it is easy to switch to the digital menu. Easy for those who may be aged within 60 years. For older people it will not be easy to say ‘look, the menu is here on the I-pad’ but we cannot deliver the I-pad to him, he must read it from our hands or we send it to his mobile phone and he can consult it from there. Even these little changes, which might seem irrelevant, can actually make older guests waver, especially those who are used to travel all around the world for 70 years. And there lies the difficulty of our professionalism in trying to cushion the change.” |
| h. RR – Rethinking 22. Positive outlook | “[It was important] to make it clear that this is only a negative, difficult, very difficult parenthesis;”; “[We knew it was temporary. It would all end forever. This difficult moment would have been over soon and we would have opened again the hotel]” |
| 23. Reflection | “[This crisis] also gave many people the opportunity to think a little about themselves, look a little inside themselves;”; “[People have discovered their professional frailty]” |
| 24. Guest-centric service | “The customer doesn’t have to be a room number any longer ... he’s someone to take care of.;”; “[It is necessary to shorten the distance between the hotel and the customer and take better care of the relationship with the customer]” |
| j. AR – Responding 25. Sememaking | “It was important to focus only on reliable and relevant information.”; “[to this mass of information and events,” |

Table 2 (continued)

| Second-order themes | First-order categories | Representative data |
|---------------------|------------------------|---------------------|
| 26. Fixing the problem | “(We need to) try to find solutions [...] In order, to understand what it would have been and how we could place ourselves as a company in this new scenario.”; “We have to find solutions.” |
| 27. Staff transition | “I realise the effort that the staff will have to make at the opening, because they are no longer used to such frequent telephone contact with the customer.”; “[The staff must be trained or re-trained. Especially for the younger ones it’s completely new]” |
| I. SI - Structural improvisation 28. Reinventing the operational logic | “We have to completely change our mentality, first for ourselves (the manager) and then for our collaborators [...] if we want to be successful, we must change our mentality of operating.”; “We must change our way of thinking, find a new way to manage the procedures and the various hotel departments.” |
| 29. Reinventing the business model (strategic opportunities) | “Stop using the tools we used up to now to look at the market trends ... the forecasts, all business intelligence indices. Now we have to respond with instinct and speed, go straight, you have to give something [...] we will do things differently or cancel what has been done so far and do them in a completely new way.;” “There will be different innovations. The way of selling products must change.” |

(AR = Adaptive resilience; RR = Reactive resilience; MI = Minor improvisation; BI = Bounded improvisation; SI = Structural improvisation). their emergence.

5.1. Leadership as gardening

The first finding reveals the importance for hospitality managers to lead the transition through the crisis as gardeners, who are able to nurture the organisation to grow smart autonomous assets. The idea matches the intuition by McChrystal et al. (2015) by which gardener’s job is to create an environment in which plants can flourish; that is, to keep the garden well organised and adequately maintained, in such a way that plants can grow individually, all at the same time5.

Our gardening metaphor is conceptually anchored in features of

5 The expression is freely inspired by the book of McChrystal et al. (2015, p. 232) which reads “The temptation to lead as a chess master, controlling each move of the organization, must give way to an approach as a gardener, enabling rather than directing. A gardening approach to leadership is anything but passive. The leader acts as an ‘Eyes-On, Hands-Off’ enabler who creates and maintains an ecosystem in which the organization operates.” That also matches the former Zappos’ CEO Tony Hsieh consideration of the organization as a “... greenhouse with lots of plants, and each plant represents an employee [...] and the CEO being] the architect of the greenhouse [...] to help figure out the right conditions within the greenhouse to enable all of the other plants to flourish and thrive.” (quote reported in Giustiniano et al., 2018, p. 118).
organisational resilience, such as purposing, planning, protecting, perfecting, and relating (second-order themes, see Fig. 1; ref. Giustiniano et al., 2018). It also takes place within the domain of minor improvisation (ref. Hadida et al., 2015). Together, these indicate that the hospitality leaders in our sample were trying to cope with the shock caused by the pandemic by creating the appropriate contextual conditions able to support the ability to overcome the crisis. Hence, in complex and dynamic environments, such as those that hospitality managers are facing due to the COVID-19, leaders tend to deploy decision making responsibility at all levels of their organisation. Like gardeners, they invest their time and resources to create a work environment where things (and people) take root and are allowed to grow on their own. They need to be able to zoom out and observe the organisation from a distance, knowing that resilience is nurtured before the crisis and is deployed as the crisis unfolds.

Considering leadership as gardening thus places an emphasis on elements such as order, stability, predictability, and improvement. Italian hospitality leaders were found to act like gardeners, looking at their organisational outcomes as less dependent on the initial planting than on consistent maintenance. Their attempts to improve, to protect, and to make the organisation stable and safe are determinant to success. The idea underlying this perspective is that leaders cannot grow people and organisation; rather, they can only make their best to cultivate a work environment through which people and organisations are allowed to grow.

Stability and improvement come with taking responsibility for the whole organisation. This is also the case for gardeners who are responsible for the whole garden and, as such, have to make sure that all of the plants are harmoniously related with each other to contribute to the beauty and health of the whole garden. One informant reported that she felt the entire responsibility for her staff and the possible difficulty that some of them may experience when trying to get the unemployment benefits provided by the government as a consequence of the pandemic. She reported her sense of responsibility and protection as follows:

I have been constantly sending messages to my employees, especially for this unemployment insurance that was so late to come […] I know the situation of every individual who works with me […] We have an external cleaning company that has always worked with us. So, I was really worried that they could pay wages regularly [to their employees who work with us]. I was concerned that my staff had done the application to get the insurance. I took responsibility for this too and this gave me a lot of stress. I wanted them to be protected.

Therefore, rather than considering change and innovation as the only options available, gardeners tend to also protect their organisation from the temptation to make significant revisions to the existing procedures and ways of doing the job. Leaders as gardeners move step-by-step in managing change, leaving open the possibility to step back. As in gardening, in reorganisation processes accomplishment is slow and reorganisation itself is not an episodic act but a process, a continuing job whose results will largely accrue to one’s successors. The leader’s approach to the crisis therefore goes through an incremental change process that requires constant attention to maintain the most appropriate conditions able to allow the organisation to survive and eventually succeed. The following statements from two of the interviewees support this idea:

I don’t have any further energy to think where to go. I wouldn’t want to make fast investments and decisions and then find out that the market requires me something else.

Now I am a little contained. I say, ‘ok, let’s get to do this and then we’ll try to rebuild, step-by-step’.

A key message from the interviews is that one of the most critical factors that help leaders to provide the effective conditions to be resilient is to lead their organisations by example. In this case, they were trying to become a role model for their subordinates. Even if the staff was highly receptive in what their bosses said, for instance during the video calls and on-line meetings, they were far more alert in interpreting the behavioural signals coming from the leader. Thus, the leader’s most powerful communication tool was her own behaviour. In this regard, consider the following quotations from two hotel managers:

It’s like the commander of a ship. At this moment, those leading the ship better not show their weaknesses, rather show themselves more firmly at the wheel.

I start working at nine in the morning and go to bed at midnight […] I will be a man among men.

Overall, this idea recalls the gardener’s attention toward the entire organisation, the team, and its cohesion. Recognising that power is diffused and shared within the organisation, the main mantra becomes ‘we have a problem that only we can understand and solve’. Leaders can practice their resilience by working together and involving the staff in attempting to face the crisis all together. Hence, resilient leadership results from people finding support in each other. The following quote shows the way in which one interviewee described this collective sense:

It’s a big family and this has been evident […] yesterday the maître brought me a reservation […] we perceived that we were all on the same boat […] These are all things that came spontaneously. When I phoned each of them to say that we were closing, I thought they treated me badly, and instead they all understood.

In summary, our interviews indicated that resilient leadership shifts the focus from the leader to the organisation. Hence, to cope with the consequences of COVID-19, leaders should firstly understand the unique environment around them (both the organisational one and the external one) because what works for one Italian hotel might not work for another one, or might even lead to failure of hotels interacting with different environments. Second, they should respond to a shock accordingly, opting for solutions that are consistent with the context they are embedded with. This suggests that, instead of invoking universal principles, hospitality managers face a crisis by adapting their leadership to the unique environment of their organisation. Therefore, what matters is the whole garden, not the gardener, and the need to bend and not to break, transforming and using knowledge for adaptive goals.

5.2. Leading while learning

The second key finding emerging from our analysis is the ability of the hospitality managers to look at the pandemic as an opportunity to learn something new and to look at the jolt as a chance to grow, to acquire new knowledge, and enrich their competences. This aggregate dimension is anchored in features of organisational resilience such as rethinking, responding, and resolving (second-order themes, see Fig. 1; ref. Giustiniano et al., 2018). Leading while learning may unfold both as bounded and structural improvisation (Hadida et al., 2015). In this case the leader is a participant in the process of resilience, learning and responding as the crisis unfolds, reinventing the business model and the operational logic in an impromptu way. Our evidence thus adds to existing work by showing that improvisation involves both extraordinary and infra-ordinary improvisations (Cunha and Clegg, 2019). These two modes are critical for learning to unfold. The following quotes underline the idea that leading the organisation in times of crisis is seen as something helpful and constructive:

We can look a little further… trying to make the most of the situation. The restart is a moment of new life, an injection of confidence for the people who work in the hotel, for the guests and for those who lead the hotel. It’s always a new moment.
The learning opportunity resulting from the crisis also recalled the opportunity to dig more deeply into the organisation to get to know it better and do what the daily routine does not usually allow to do. This requires revising, enriching, and questioning one’s approach to managing the organisation. Hence, especially in peak season, hospitality leaders are deeply immersed in their silos. They have no time to consider apparently less relevant managerial and organisational issues that might be critical to the hotel’s performance. Practicing resilient leadership thus calls for more attention toward reconsidering how work was conducted before the crisis. For example, two informants commented that:

We have opportunities for improvement... For instance, at this moment, I know every type of cost and anything else [...] In my case, the financial knowledge of the company has grown, which is an important part. I tend more to do the operational part with customers, with the staff... The numbers are those that I am happy to delegate because it is the one I like least, but it was a positive factor because it helped me take the big picture of the company in this moment [...] I do hope that this 'mental crisis' will remain, so as not to fall back into one’s comfort zone... one then falls into habits. It was also an opportunity to examine the company even better and give it a more in-depth internal re-reading, because when everything is fine one is so busy that [...] you say ‘this has always been working’.

In our data we found powerful evidence that the participants seemed to face the crisis by being open toward challenging the status quo, rethinking the way of doing the job, of offering their service or selling their products. In particular, they told us they should be willing to correct the mistakes made in the past, to take the time to renovate their managerial skills, and to pose greater emphasis on services that should be primary but which have been moved to the background over the years. This idea was shared by some of our respondents:

I took it as a challenge. In my opinion, moments of crisis can open up new possibilities. They make you better and make you understand where you went wrong in many years and in many details and change.

Great attention returns to services that we took for granted (such as cleaning), which were valued very little before, but which had to be fundamental even then. Sometimes we lose our bearings because we are focused so much on other things, I don’t know... being social, posting videos everywhere and you end up neglecting the cleanliness, the welcome, the smile.

The participants described a variety of explorative directions that they intend to pursue as a consequence of the shock caused by COVID-19. Some of them pointed to entering into new markets that have so far been neglected or overlooked; others referred to the need to make a shift in the way they conceive their job. Overall, this demonstrates that these leaders also think about crises as an opportunity to make a change, to revisit their organisation, their strategies, and their mindset. As reported by some of the informants involved in this study:

All our offers have been reformulated to meet the domestic market [...] This is an opportunity for many of us to say ‘ok, I can change, I can get back on the market, I can do other things’, to say ‘ok, we have always served a demand which is 90 % American and suddenly everything collapses... maybe this is the time to become a little more domestic, to stop working easy, to put ourselves in the game... Here is the ability to completely redesign the service. For example, the breakfast buffet. The drama of not being able to have a buffet anymore. This was key to us. It was really our strength. Now it completely fails. We must find another key resource, we must work hard to find it. It is useless to persist on an element that is missing. The big difficulty is elasticity [...] I make some reasoning and then I stop and I say to myself ‘be careful that you are reasoning as you have reasoned so far’.

We need to make an effort to hear what the customers have to say, their perceptions, and understand what they want to hear. Make an effort to jump to the other side of the fence. So staying on the front line to understand their needs [...] Through the ‘wind’ of the guest, the manager must learn.

Leading while learning thus emerged as a key feature characterising resilient leadership: exercising resilience entails to learn from setbacks, to be able open toward new possibilities, new options, both for the leaders themselves and for the organisation. A higher learning capacity helps a leader to cope better with adversities and recover more quickly, facilitating the effective handling of difficulties.

6. Discussion
6.1. Contribution to theory

The main findings emerging from the analysis respond to our research question on how hospitality leaders improvised resilience in practice while facing the shock caused by COVID-19. The components of resilient leadership that we identified offer a contribution to the extant literature on leadership, resilience, and improvisation. Furthermore, we believe that our findings confirm that resilient leadership shows some paradoxical aspects, as anticipated by conceptual intuition of Giustiniano et al. (2020), and therefore we can also offer a contribution to that research.

First, we found empirical grounds to the insight formulated by McChrystal et al. (2015) that leadership can be interpreted as gardening. Nonetheless, such a component per se appears to be insufficient for achieving resilience if not complemented by the emphasis and openness on learning. Furthermore, leadership as gardening and leading while learning appears to be two conceptual propagations that complete the dialectic interpretation of resilience as formulated by Giustiniano et al. (2018). To this extent, these two components act as intertwined rather than standing in isolation.

The interdependence between gardening and learning led to our second contribution. We discovered that resilient leadership is a process with a notorious paradoxical nature (Giustiniano et al., 2020). It is rich in tensions and these tensions (rationality vs. empathy, protecting the mission vs. exploration, being conservative vs. foresight) are necessary to navigate the crisis. We found that leaders need to be able to represent themselves as being in the system and outside the system to be able to empathise and keep an emotional distance, to improvise a move as they plan the next move. What is revealing here for theory is the fact that resilient leadership implies a combination of paradoxical actions, involving a paradoxical capability: the capacity to maintain normal functioning in extraordinary times.

Improvisation is a third important contribution. Resilient leadership is an improvised act. As indicated by scholars, improvisation is not strictly responsive, but it rather implies preparation (Ciuéhta et al., 2020; Cunha et al., 1999). We expanded improvisation theory by showing that in times of crisis, leaders improvise solutions that build resilience that feeds back on the capacity to conduct further improvisations. Our findings show that the combination of the care for the organisation (gardening) and the adoption of learning as an attitude helps organisations and their leaders to avoid unwanted consequences, such as the ones identified by prior studies (e.g. Batista et al., 2016; Giustiniano et al., 2016) as the “dark side” of organisational improvisation. We therefore presented improvisation and resilience as deeply engaged and fuelling one another, indicating that improvisation is more than episodic responding to specific events, a process entangled with other processes, with both reactive and adaptive features (Abracht et al., 2018; Cunha et al., 2014).

Our fourth contribution is offered to the paradox theory because we revealed that resilient leadership implies a combination of paradoxical actions. In fact, the nurturing of resilience requires a paradoxical
capacity to understand that leaders must be able to prepare themselves to create an organisational garden in which operational efficiency may be replaced by improvisational capacity. Resilience implies the capacity to respond to challenges in a way that is cultivated in a long-term orientation and a capacity to respond to issues that requires immediate mobilisation and ad-hoc action. Our data suggest that resilient leadership is not about preparing the long term or responding to the short term, but it is about both: it is about planning and dropping one’s plans in face of “vu jade” types of situations (Weick, 1993). To this extent, our findings testify that when the either/or problem framing offered by traditional trade-offs approach weakens or fails, the both/and (Smith et al., 2016) paradoxical acceptance of reality is the only option to be pursued. The paradoxical competency of resilient leadership in this case involved the activation of opposites that were imposed by the situation. Improvisation and paradoxical choices are often theorised as expressions of agency, but our study reveals that they may be imposed by situations.

6.2. Practical implications

Our findings offer some important insights to managers. Some authors believe that in the long-term aftermath of COVID-19, technological and organisational modularisation will be necessary for organisation to survive, especially if social distancing will become part of the “new normal” (e.g., Foss, 2020). We believe that the inner complexity of the services offered in the hospitality industry may create an unsurmountable constraint to modularisation. If so, then organisations and their leaders should be able to “complexify” their actions (Tsoukas, 2017); in the sense that the acceptance of the paradoxical nature of a complex reality could be a way out of the problem. Our findings expose the paradoxical nature of the process, meaning that cultivating a “both-and” approach may be necessary to prepare an organisation to respond to crises (Smith et al., 2016). A paradoxical view may be important, not only to respond to organisational challenges in normal times but also in extreme times.

We also indicated that improvisation, or the capacity to respond deliberatively in the absence of a plan (Cicchuta et al., 2020; Cunha et al., 1999; Hadida et al., 2015), is important to keep a system resilient. As one of our informants explained, they had to “Stop using the tools we used up to now to look at the market trends… the forecasts, all business intelligence indices. Now we have to respond with instinct and speed, go straight, you have to give something” (see Table 2). Improvisation has been considered to explain the capacity of response to jolts (e.g. Bigley and Roberts, 2001; Roux-Dufort and Vidalilet, 2003). We offered a complementary explanation: improvisation is important because it supports the reliance of the system; that is, not only because of its direct but also because of indirect effects over the social infra-structure. This has important managerial implications because it shows that promoting space for ordinary improvisations in normal times (Cunha and Clegg, 2019) may contribute to the resilience of the system. Thus, while organisational improvisation remains difficult to grasp because of its complexity (Cicchuta et al., 2020), cultivating this improvisational competence may be another expression of gardening in normal times.

6.3. Research limitations and avenues for future research

Our study suffers from some limitations based on the uniqueness of the setting and the usual boundaries to which qualitative methodologies are exposed. For example, CODIV-19 sheds a grey light of uncertainty that could have altered the interviewees responses. Moreover, the short duration of the call for papers that animated this study represents an objective limit to any further longitudinal analysis. At the same time, the pandemic and the immediate lockdown that resulted from it in Italy, when seen from a mere scholarly perspective, provided a unique opportunity to use it as an “open lab” for testing resilience with unprecedented privileges to the in-vivo observation of an ongoing phenomenon (i.e. hotel managers reactions) as they were emerging and developing. Consequently, for future research our study indicates that studying resilience as a process may show how resilient leadership may take very different forms in different moments (Hartmann et al., 2020).

Following recent studies (see Linnenluecke, 2017), we also acknowledge that the focus on the hospitality industry might question the generalisability of our work to other industries that are less or indirectly affected by economic, political, and social changes. Consequently, future research might devote attention to examine whether resilient leadership is situation-specific or, conversely, we might isolate individual-level resources and capabilities that are likely to promote resilience across a variety of contexts. To better explore resilience’s context-specificity, future studies might look at whether practicing resilience differs depending upon the severity of the adversity (Williams et al., 2017). Researchers might also provide a contribution to understand whether being presented with a rare, devastating event instead of a more ordinary, even if adverse, event might affect the way in which individuals improvise resilience.

We focused on the leader side of the process, but the context and the relational dimension of leadership seem to be equally critical to understand the process of resilience. We also invite scholars to explore the processes whose entanglement supports the expression of resilience. Although we explored the case of improvisations, other processes (such as social capital, psychological capital, distributed leadership, etc.) may also be involved and may be studied in articulation.

Due to the lack of a clear conceptualisation of the term (see Hartmann et al., 2020; Williams et al., 2017), resilience might embrace the effect of related concepts, such as grit, safety, stability, agility (Linnenluecke, 2017), as well as the influence of emerging constructs, such as relational energy (Kossek and Perrigino, 2016) and perceived organisational support for strengths use (van Woerkom et al., 2016). Including these in future studies might help us to understand whether and how they explain additional variance in the way in which leaders practice resilience.

Finally, considering the focus of our work on how leaders improvise resilience during the COVID-19 crisis, we do not provide evidence on whether and how the shock experienced due to the epidemic is likely to foster leaders’ resilience in the future. Supported by the literature on post-traumatic growth (Masten and Narayan, 2012), future research might examine to what extent leaders can benefit from experiencing a significant stressor. Given that resilience tends to be domain specific (Harms et al., 2017; Kossek and Perrigino, 2016), these benefits could be investigated by identifying the leader’s knowledge domains that are involved in the learning process. Inspired by this, it might be interesting to also investigate to what extent the individual growth and learning that occur following an adversity compensate for the harm suffered (see Britt et al., 2016).

7. Conclusion

The objective of this study was to explore the way in which resilient leadership unfolds when presented with a shock. Based on an exploratory qualitative research on the Italian hospitality industry, which has been hit severely by the COVID-19 epidemic (more so than other industries), this work suggests that resilient leadership and improvisation are strictly interrelated. Their interdependence leads to a paradox: to improvise resilience, leaders have to engage in a continuous preparation (i.e. gardening), while at the same time feeding their capacity to learn as the crisis unfolds. A quote attributed to the former racing driver Mario Andretti reads: “If everything seems under control, you’re not going fast enough”. Similarly, resilient leaders are called to be both in the system and outside it, so that learning can take place while planning is on the edge of control.
