* Deceased author

**Abstract**
We present a genome assembly from an individual male *Xestia xanthographa* (the square-spot rustic; Arthropoda; Insecta; Lepidoptera; Noctuidae). The genome sequence is 934 megabases in span. The majority of the assembly (99.94%) is scaffolded into 31 chromosomal pseudomolecules, with the Z sex chromosome assembled.

**Keywords**
*Xestia xanthographa*, square-spot rustic, genome sequence, chromosomal, Lepidoptera

This article is included in the Tree of Life gateway.

Background
*Xestia xanthographa* (square-spot rustic) is a widespread noctuid moth found across much of the Palearctic, Europe, North Africa and North America; its larvae are nocturnal feeders on various grasses. In the UK, adults are abundant in late summer from August to September and the species overwinters as a larva. *Xestia xanthographa* was a key species in a recent study revealing the detrimental effects of street-lighting on caterpillar abundance in the UK (*Boyes et al.*, 2021). The species has also been recorded as a common prey species for autumn-flying bats (*Razgour et al.*, 2011), and, as an adaptation to facilitate bat avoidance, the auditory sensitivity of *X. xanthographa* is broadly tuned with an optimal frequency of 30 kHz (*Norman & Jones*, 2008).

The genome of *X. xanthographa*, was sequenced as part of the Darwin Tree of Life Project, a collaborative effort to sequence all of the named eukaryotic species in the Atlantic Archipelago of Britain and Ireland. Here we present a chromosomally complete genome sequence for *X. xanthographa*, based on one male specimen from Wytham Woods, Oxfordshire, UK.

Genome sequence report
The genome was sequenced from a single male *X. xanthographa* collected from Wytham Woods, Oxfordshire, UK (latitude 51.772, longitude -1.337) (*Figure 1*). A total of 27-fold coverage in Pacific Biosciences single-molecule long reads (N50 12 kb) and 40-fold coverage in 10X Genomics read clouds were generated. Primary assembly contigs were scaffolded with chromosome conformation Hi-C data. Manual assembly curation corrected 86 missing/misjoins and removed 17 haplotypic duplications, reducing the assembly size by 1.41% and scaffold number by 44.86%, and increasing the scaffold N50 by 1.61%.

The final assembly has a total length of 934 Mb in 59 sequence scaffolds with a scaffold N50 of 31 Mb (*Table 1*). Of the assembly sequence, 99.94% was assigned to 31 chromosomal-level scaffolds, representing 30 autosomes (numbered by sequence length), and the Z sex chromosome (*Figure 2–Figure 5; Table 2*). The assembly has a BUSCO (*Simão et al.*, 2015) completeness of 98.7% using the lepidoptera_odb10 reference set. While not fully phased, the assembly deposited is of one haplotype. Contigs corresponding to the second haplotype have also been deposited.

Methods
Sample acquisition and nucleic acid extraction
A male *X. xanthographa* (iIXesXant1) and a second specimen of unknown sex (iIXesXant2) were collected from Wytham Woods, Oxfordshire, UK (latitude 51.772, longitude -1.337) by Douglas Boyes, University of Oxford, using a light trap. The specimens were identified by the same individual and snap-frozen on dry ice.

DNA was extracted from whole organism tissue of iIXesXant1 at the Wellcome Sanger Institute (WSI) Scientific Operations core from the whole organism using the Qiagen

*BUSCO scores based on the lepidoptera_odb10 BUSCO set using v5.1.2. C= complete [S= single copy, D= duplicated], F=fragmented, M=missing, n=number of orthologues in comparison. A full set of BUSCO scores is available at https://blobtoolkit.genomehubs.org/view/ilXesXant1.2/dataset/CAJHXD02/busc*. 

MagAttract HMW DNA kit, according to the manufacturer’s instructions. RNA was extracted from thorax/abdomen tissue of iXesXant2 in the Tree of Life Laboratory at the WSI using TRIzol (Invitrogen), according to the manufacturer’s instructions. RNA was then eluted in 50 μl RNase-free water and its concentration assessed using a Nanodrop spectrophotometer and Qubit Fluorometer using the Qubit RNA Broad-Range (BR) Assay kit. Analysis of the integrity of the RNA was done using Agilent RNA 6000 Pico Kit and Eukaryotic Total RNA assay.

**Sequencing**

Pacific Biosciences HiFi circular consensus and 10X Genomics Chromium read cloud sequencing libraries were constructed according to the manufacturers’ instructions. Poly(A) RNA-Seq libraries were constructed using the NEB Ultra II RNA
**Figure 2. Genome assembly of *Xestia xanthographa*, ilXesXant1.2: metrics.** The BlobToolKit Snailplot shows N50 metrics and BUSCO gene completeness. The main plot is divided into 1,000 size-ordered bins around the circumference with each bin representing 0.1% of the 933,882,218 bp assembly. The distribution of scaffold lengths is shown in dark grey with the plot radius scaled to the longest scaffold present in the assembly (42,568,189 bp, shown in red). Orange and pale-orange arcs show the N50 and N90 scaffold lengths (31,247,186 and 23,512,362 bp), respectively. The pale grey spiral shows the cumulative scaffold count on a log scale with white scale lines showing successive orders of magnitude. The blue and pale-blue area around the outside of the plot shows the distribution of GC, AT and N percentages in the same bins as the inner plot. A summary of complete, fragmented, duplicated and missing BUSCO genes in the lepidoptera_odb10 set is shown in the top right. An interactive version of this figure is available at [https://blobtoolkit.genomehubs.org/view/ilXesXant1.2/dataset/CAJHXD02/snail](https://blobtoolkit.genomehubs.org/view/ilXesXant1.2/dataset/CAJHXD02/snail).

**Library Prep kit.** Sequencing was performed by the Scientific Operations core at the Wellcome Sanger Institute on Pacific Biosciences SEQUEL II (HiFi), Illumina HiSeq X (10X) and Illumina HiSeq 4000 (RNA-Seq) instruments. Hi-C data were generated from abdomen tissue of ilXesXant1 using the Arima v1.0 kit and sequenced on HiSeq X.

**Genome assembly**

Assembly was carried out with Hifiasm ([Cheng et al., 2021](#)). Haplotypic duplication was identified and removed with purge_dups ([Guan et al., 2020](#)). One round of polishing was performed by aligning 10X Genomics read data to the assembly with longranger align, calling variants with freebayes.
Figure 3. Genome assembly of *Xestia xanthographa*, iIXesXant1.2: GC coverage. BlobToolKit GC-coverage plot. Scaffolds are coloured by phylum. Circles are sized in proportion to scaffold length. Histograms show the distribution of scaffold length sum along each axis. An interactive version of this figure is available at https://blobtoolkit.genomehubs.org/view/iIXesXant1.2/dataset/CAJHDX02/blob.

(Garrison & Marth, 2012). The assembly was then scaffolded with Hi-C data (Rao et al., 2014) using SALSA2 (Ghurye et al., 2019). The assembly was checked for contamination and corrected using the gEVAL system (Chow et al., 2016) as described previously (Howe et al., 2021). Manual curation was performed using gEVAL, HiGlass (Kerpedjiev et al., 2018).
The grey line shows cumulative length for all scaffolds. Coloured lines show cumulative lengths of scaffolds assigned to each phylum using the buscogens taxrule. An interactive version of this figure is available at https://blobtoolkit.genomehubs.org/view/ilXesXant1.2/dataset/CAJHXD02/cumulative.

Figure 4. Genome assembly of Xestia xanthographa, ilXesXant1.2: cumulative sequence. BlobToolKit cumulative sequence plot.

and Pretext. The mitochondrial genome was assembled using MitoHiFi (Uliano-Silva et al., 2021), which performed annotation using MitoFinder (Allio et al., 2020). The genome was analysed and BUSCO scores generated within the BlobToolKit environment (Challis et al., 2020). Table 3 contains a list of all software tool versions used, where appropriate.
**Figure 5.** Genome assembly of *Xestia xanthographa*, iIXesXant1.2: Hi-C contact map. Hi-C contact map of the iIXesXant1.2 assembly, visualised in HiGlass. Chromosomes are given in size order from left to right and top to bottom.

**Table 2.** Chromosomal pseudomolecules in the genome assembly of *Xestia xanthographa*, iIXesXant1.2.

Data availability

European Nucleotide Archive: Xestia xanthographa (square-spot rustic). Accession number PRJEB42066; https://identifiers.org/ena.embl/PRJEB42066.

The genome sequence is released openly for reuse. The X. xanthographa genome sequencing initiative is part of the Darwin Tree of Life (DTol) project. All raw sequence data and the assembly have been deposited in INSDC databases. The genome will be annotated and presented through the Ensembl pipeline at the European Bioinformatics Institute. Raw data and assembly accession identifiers are reported in Table 1.

Boyres and Holland report on the genome assembly of the square-spot rustic, Xestia xanthographa. They used Pacbio HiFi and 10X Genomics reads and Hi-C for scaffolding the contigs into chromosomes, resulting in a 934 Mb genome assembled into 31 chromosomes.

The sequencing methods used are high-end, the assembly and QC methods are appropriate and the assembly seems of high quality.

Is the rationale for creating the dataset(s) clearly described?
Yes

Are the protocols appropriate and is the work technically sound?
Yes

Are sufficient details of methods and materials provided to allow replication by others?
Yes

Are the datasets clearly presented in a useable and accessible format?
Yes

Competing Interests: No competing interests were disclosed.

Reviewer Expertise: Adaptation, speciation, genomics

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.
The data note by Douglas et al. described the dataset of the assembled square-spot rustic genome. The manuscript clearly presented the methods used for sampling, sample preparation, sequencing, and data analysis, with the related statistics presented. The genome assembly is of good quality, with long scaffold N50 and anchored to chromosomes, making it valuable for later genome and other studies. I think the current manuscript is good enough to be published as a data note. Meanwhile, I have the following suggestions for the authors to consider:

1. In the 'Genome sequence report' section on Page 5, the statement of BUSCO results might need to be modified. Interpretation of the BUSCO result should be like “98.7% of the BUSCOs in the lepidoptera_odb10 dataset were found to be complete”, as you can also observe the other 1% to be either in multiple copies (duplicated), or fragmented. This reflected the completeness of the genome assembly.

2. Also, in the part mentioned above, I would suggest providing some statistics (at least the length maybe) of the assembled second haplotype, which would be informative for understanding the heterozygosity in the genome.

3. I found all the data notes in the same gateway directly used figures from the BlobToolkit Viewer. I would suggest revising the figures in the data note thus they would be a better fit. For example, the axis labels might be better to be revised in cases and the font sizes and the dataset label can also be removed. I don't know what the ‘Scale’ means in Figure 2, and I think Figure 3 and Figure 4 are quite difficult to understand, at least for me.

Last, I would like to express my condolence on Douglas Boyes' death. After noting this from the manuscript and searched online, I would like to thank his contributions in providing this valuable dataset.
