Citation: Inkhavilay K, Siriboon T, Sutcharit C, Rowson B, Panha S (2016) The first revision of the carnivorous land snail family Streptaxidae in Laos, with description of three new species (Pulmonata, Stylommatophora, Streptaxidae). ZooKeys 589: 23–53. doi: 10.3897/zookeys.589.7933

Abstract
The family Streptaxidae in Laos is revised. Twelve species are known, mainly from limestone areas, in the genera Discartemon Pfeiffer, 1856, Perrottetia Kobelt, 1905, Haplopychius Möllendorff, 1906, and Indodoartemon Forcart, 1946. Three new species, P. unidentata sp. n. and P. megadentata sp. n. from northern and central Laos, and I. diodonta sp. n. from central Laos, are described. All eight species of these three genera previously recorded from Laos are revised and discussed based on examined material from Laos, Cambodia, Vietnam and Thailand. Type material was examined and lectotypes are designated. Details of genital anatomy and radulae are provided, including the first detailed genitalia and radula descriptions from Haplopychius. Two novelties in Streptaxidae, a vaginal caecum, and the occurrence of aphyalic individuals, are reported from H. pellucens (Pfeiffer, 1863).

Keywords
Limestone, tropical forest, systematics, type specimen, Southeast Asia, predator, taxonomy, aphyal
Introduction

The Streptaxoidea currently comprises two families, the worldwide Streptaxidae Gray, 1860 and the Southeast Asian endemic Diapheridae Panha and Naggs, 2010 (Richardson 1988, Schileyko 2000, Rowson et al. 2010a, Sutcharit et al. 2010). The Streptaxidae Gray, 1860 are active predators with an eccentric to cylindrical shell, usually with apertural dentition, and a yellowish to orange soft body (Zilch 1960, Schileyko 2000, Rowson et al. 2010b, Siriboon et al. 2013, 2014a, b).

Early classifications of the family such as W. Kobelt (1905–6), used mainly shell shape and the arrangement of apertural dentition. However, many shell characters are highly conserved or occur recurrently, making some species and genera difficult to separate. Fortunately, the reproductive organs of streptaxids can also be taxonomically significant (e.g. Schileyko 2000, Rowson and Tattersfield 2013, Siriboon et al. 2013, 2014a, b). Few reports have contributed data on the genitalia of Southeast Asian taxa (e.g. Stoliczka 1871, Berry 1963, 1965) until recently (Siriboon et al. 2013, 2014a, b, Páll-Gergely et al. 2015).

In Indochina, streptaxid diversity was throught to comprise only 10 genera and about 40 species (Bruggen 1967). However, in the last decade 21 new species (more than half the previous total) and one new genus have been described from Indochina (Siriboon et al. 2013, 2014a, b, Do and Do 2015). Thirty-seven species are recorded from Thailand (Panha 1996, Hemmen and Hemmen 2001, Siriboon et al. 2013, 2014a, b), 10 from Myanmar (Blanford and Godwin-Austen 1908), and 45 from Vietnam (Schileyko 2011). In contrast, only three species were reported from Laos in the past two centuries (Pfeiffer 1863, Möllendorff 1898), with three others added in recent years (Schileyko 2011, Do and Do 2015).

Almost all groups of the land snail fauna in Laos have been less-well studied than those of neighbouring areas. The Lao People’s Democratic Republic, until recently encompassed some of the most significant forest areas remaining in Southeast Asia such as mountainous areas in the north and limestone karsts in central area, and some of the most intact biota left in Asia (Kemp 2011). Those habitat characteristics also harbor diverse of terrestrial molluscan fauna. The present paper focuses on the four genera, Discartemon Pfeiffer, 1856, Perrottetia Kobelt, 1905, Haploptychius Möllendorff, 1906, and Indoartemon Forcart, 1946 that were formerly recorded from Laos. Genital anatomy and shell micro-structures of are carefully investigated. The type specimens of all known species were examined, and the penial hooks and radula morphology of Haploptychius are defined for the first time. This adds significantly to knowledge of the Streptaxidae in Indochina and especially in Laos.

Materials and methods

Animals were collected from evergreen forest in the north, and limestone karsts and dipterocarp forest in the south of Laos. Live specimens were photographed
and then stored at -20 °C and then preserved in 70% ethanol (v/v) for anatomical studies. The identifications were based on Pfeiffer (1863), Möllendorff (1898), Kobelt (1905–1906), Blanford and Godwin-Austen (1908), Bavay and Dautzenberg (1903, 1908), and Siriboon et al. (2013, 2014b). Shell height (H), shell width (W), whorl count and H/W ratio were measured and interpreted following Siriboon et al. (2013). Shells and genitalia were investigated and digital images taken using Cell’D Imaging Software. All live adult specimens of each species were dissected and the genitalia examined under a stereo-microscope and representatives selected for illustrations under a camera lucida. The buccal masses were removed, and the radulae were soaked in 10% NaOH then cleaned in distilled water. Radula, penial hooks and vaginal hooks were examined and photographed under SEM (JEOL, JSM-5410 LV). In the descriptions, ‘proximal’ relates to the genital orifice, and ‘distal’ refers to the region furthest away from the genital orifice. The term ‘vaginal caecum’ is defined herein.

**Anatomical abbreviations.** ag, albumen gland; at, atrium; fo, free oviduct; gd, gametolytic duct; gs, gametolytic sac; hd, hermaphroditic duct; ov, oviduct; p, penis; pr, penial retractor muscle; ps, penial sheath; psr, penial sheath retractor muscle; sv, seminal vesicle; ta, talon; v, vagina; vc, vaginal caecum; vd, vas deferens (Sutcharit et al. 2010, Siriboon et al. 2013, 2014a, b).

**Institutional abbreviations.** Materials examined in this study were deposited in the following institutions:

- CUMZ  Chulalongkorn University Museum of Zoology, Bangkok.
- MNHN  Muséum National d’Histoire Naturelle, Paris.
- NHMUK  The Natural History Museum, London.
- NUOL  National University of Laos, Vientiane.
- SMF  Forschungsinstitut und Naturmuseum Senckenberg, Frankfurt am Main.

**Systematics**

**Family Streptaxidae Gray, 1860**

**Genus Discartemon** Pfeiffer, 1856

*Discartemon* Pfeiffer, 1856: 173. Siriboon et al. 2014a: 48, 49.

*Odontartemon* (*Discartemon*)—Kobelt 1905: 91, 96.

**Type species.** *Streptaxis discus* Pfeiffer, 1851, by subsequent designation by Ancey (1884: 399).

**Remark.** The genus was recently revised. For complete illustrations, species descriptions and dichotomous key see Siriboon et al. (2014a).
Discartemon discus (Pfeiffer, 1853)

Streptaxis discus Pfeiffer, 1853: 252. Type locality: Unknown.

Streptaxis (Discartemon) paradiscus Möllendorff, 1900: 117. Type locality: Phucson bei Touranne, Annam [Da Nang Province, Vietnam].

Discartemon discus—Siriboon et al. 2014a: 53–55, figs 4a–c, 11a–c, 22a.

Material examined. Lectotype of Streptaxis discus Pfeiffer, 1853 NHMUK 20130684. Lectotype of Streptaxis paradiscus Möllendorff, 1900 SMF 108534 and paralectotypes SMF 108535 (5 shells).

Remarks. Discartemon discus has been recently re-described from the shell, genitalia and radula, and type specimens were re-investigated and illustrated (see Siriboon et al. 2014a).

All previous records of this species were all from “Annam” (Siriboon et al. 2014a). This term is a historical political division during the colonial period, with an uncertain boundary. The distribution of D. discus (=D. paradiscus) in Laos was reported by Schileyko (2000: 784, 2011: 23). However, no specimens were found by the present study and the records from Laos remain to be confirmed.

Genus Haploptychius Möllendorff, 1906

Haploptychius Möllendorff in Kobelt 1906: 127. Zilch 1960: 562. Richardson 1988: 211. Schileyko 2000: 796, 797.

Odontartemon (Haploptychius)—Thiele 1931: 730. Forcart 1946: 215. Oophana (Haploptychius)—Benthem Jutting 1954: 76, 95.

Type species. Streptaxis sinensis Gould, 1859, by original designation.

Description. Shell depressed to very distorted, mostly white-hyaline or transparent. Shell surface smooth and glossy or with fine radial ridges. Embryonic shell smooth; following whorls increasing regularly; penultimate whorls slightly to strongly extended beyond body whorl. Last whorl rounded and more or less deviated from the vertical axis. Umbilicus narrowly open and deep. Aperture sub-circular to semi-ovate. Peristome expanded and reflected. Apertural dentition always consisting of a single parietal lamella. Schileyko (2000) includes species with a “smooth” parietal wall, i.e. without a lamella in Haploptychius, but whether such taxa belong in this genus requires further investigation.

Live specimens exhibit a semi-transparent bright yellow body, sometimes with brownish spots; skin reticulated. Upper tentacles yellow to orange, long, with black eye-spot on tip; lower tentacles short. Brownish digestive gland and black kidney may be visible through transparent shell. Foot narrow, undivided and with short tail.

Genitalia with long and slender penis; penial sheath long, about a half to whole length of penis. Internal wall of penis with numerous long and slender penial hooks in
longitudinal arrangement. Vas deferens passes under penial sheath before connecting apically to penis. Vagina and free oviduct short. Seminal vesicle present, convoluted and short. Vaginal hooks not found.

**Remarks.** Currently, the genus *Haploptychius* consists of about 40 nominal species distributed from India to Indochina, south of China and Greater Sunda Islands (Kobelt 1906, Zilch 1961, Richardson 1988, Schileyko 2000). Fifteen species were reported from Indochina, of which only three species: *H. pellucens* (Pfeiffer, 1863), *H. porrectus* (Pfeiffer, 1863) and *H. fischeri* (Morlet, 1887) were recorded from Laos (see Gude 1903, Kobelt 1906, Schileyko 2011).

General shell morphology of *Haploptychius* is quite similar to *Oophana* Ancy, 1884 and *Indoartemon* Forcast, 1946. However, it differs in having only a parietal lamella; while *Oophana* usually has parietal, palatal, columnar and basal lamellae, and *Indoartemon* always has parietal and basal lamellae. In addition, the genitalia of *Haploptychius* have a penial sheath extends about a half to entire the penis length, vas deferens passes through penial sheath, and long slender penial hooks. In *Oophana*, the vas deferens enter the penial sheath apically with very short vagina (Berry 1963, Schileyko 2000); and *Indoartemon*, the vas deferens attached (not pass through) the penial sheath, with small and short penial hooks (Siriboon et al. 2013).

*Carinartemis* Siriboon & Panha, 2013 resembles *Haploptychius* in having only a parietal lamella. However, it differs from *Haploptychius* in its very sharp peripheral keel and having the last whorl more deviated from the vertical axis. In addition, the genitalia has thick or thin penial sheath, penial hook short and stout, and vaginal hooks present (Siriboon et al. 2014b).

The relatively large, distorted heliciform shell and dentition restricted to a parietal lamella clearly differentiate *Haploptychius* from *Discartemon* Pfeiffer, 1856 and *Perrottetia* Kobelt, 1905 (Schileyko 2000, Siriboon et al. 2013, 2014a, b).

**Haploptychius pellucens** (Pfeiffer, 1863)

Figs 1, 2A, 3A–C, 7A, B, 8A–D, 9A–F, 10G; Table 1

*Streptaxis pellucens* Pfeiffer 1863 [1862]: 273, pl. 36, fig. 6. Type locality: Lao Mountain, Camboja [Cambodia]. Martens 1867: 85. Pfeiffer 1868: 441. Pfeiffer 1871: 29, pl. 115, figs 11, 12. Morlet 1883: 105, pl. 4, fig. 2, 2a. Tryon 1885: 71, 72, pl. 14, figs 98–100. Gude 1903: 212.

*Haploptychius pellucens*—Kobelt 1906: 132, 133, pl. 61, figs 17–20. Richardson 1988: 217, 218. Schileyko 2011: 24, 25.

**Material examined.** This species was described from the H. Cuming collection. An illustration of the shell and one set of measurements were given in the original description. Three specimens from the Cuming collection at NHM have Pfeiffer’s handwritten label stating the species name and locality. In order to stabilise the name, an identical specimen matching with the illustration and measurements given in the original de-
Figure 1. Approximate locations of the type localities of *Haploptychius* spp., *Perrottetia* spp., and *Indoartemon* spp. in Laos. Described species (●) *Haploptychius pellucens*, (○) *Haploptychius porrectus*, (★) *Haploptychius blaisei*, (△) *Perrottetia aquilonaria*, (▲) *Perrottetia unidentata* sp. n., (□) *Perrottetia megadentata* sp. n. and (■) *Indoartemon diodonta* sp. n. The numbered localities are detailed in Table 1, except locality no. 6 is from Tam Kao Rao, Vieng Phoukha, Luang Namtha, Laos, and no. 11 from Ban Bo Khoun, Boun Neua, Phongsaly, Laos.

The description is designated here as lectotype NHMUK 20160249.1 (Fig. 3A; H = 11.7, W = 11.2). The other two remaining shells from the same lot then became paralectotypes NHMUK 20160249.2 (2 shells; Fig. 3B; H = 11.1, W = 10.6 and H = 13.1, W = 13.4).

Aperture subcircular; peristome thin, little expanded and reflected. Apertural dentition with one more or less strong parietal lamella. Umbilicus open and deep (Fig. 3A–C).

**Radula.** Each row consists of 77–85 teeth with formula (38-42)-1-(38-42). Central tooth very small, triangular, with a pointed cusp. Lateral and marginal teeth undif-
ferented, lanceolate, unicuspid. Latero-marginal teeth gradually reduce in size, with outermost teeth much smaller and shorter than inner teeth (Fig. 10G).

**Genital organs.** Atrium (at) short. Proximal penis (p) stout about one-thirds of penis length; distal penis slender. Penial sheath (ps) thin, extending about half of penis length; penial sheath retractor muscle (psr) very thin, originating at atrium and inserted apically at penial sheath (Fig. 6A). Vas deferens (vd) passes through about one-third of penial sheath length before entering into penis apically. Penial retractor muscle (pr) very thick and connected at penis apically (Fig. 7A, B).

Internal wall of atrium generally corrugated with numerous atrial pores (Fig. 9A). Penial wall densely covered in light brown penial hooks, about 6 hooks/200 $\mu$m². Hooks located on low conical penial papillae, separated by thin reticulated folds. Penial hooks small ($<0.1$ mm in length), long, slender, slightly expanded at base, tips pointed and curved towards genital orifice (Fig. 9B–E).

Vagina (v) short, about one-third of penis length. Gametolytic duct (gd) long tube extending to albumin gland; gametolytic sac (gs) ovate. Free oviduct (fo) proximally large with almost equal diameter to vagina, becoming narrower distally. Oviduct (ov) enlarged and folded; prostate gland inconspicuous and bound to oviduct. Talon (ta) small, short and club-shaped. Hermaphroditic duct (hd) bearing long and thin seminal vesicle. Seminal vesicle (sv) about three times longer than the length from talon to branching point of seminal vesicle (Fig. 7A).

Vaginal wall with series of transverse and undulated parallel vaginal folds; vaginal hooks absent (Fig. 9F).

**Distribution.** This species is known from several limestone areas from central to northern part of Laos. The animals can be found at altitudes from 150-300 meters above mean sea level.

**Remarks.** This species can be distinguished from *H. porrectus* by having a larger shell, more elevated spire and less oblique aperture. The vas deferens passes through a shorter part of the penial sheath length, and the vagina wall has undulated transverse ridges rather than papillae. *Haploptychius pellucens* can be distinguished from *H. costulatus* (Möl-lendorff, 1881) from China by having a larger and thinner shell, narrower umbilicus and having the left periphery of the penultimate whorl extending beyond the diameter of the last whorl. *Haploptychius fischeri* differs from this species by having a larger, more depressed and thicker shell, with a more obtuse spire, and subquadrangular aperture (Fig. 3G).

All live adult specimens were dissected and the genitalia have been examined, and three different types of genitalia are observed. There are six fully adult specimens collected from Nam Ork Roo, Oudomxay with ‘normal’ genitalia (Fig. 8A). Two specimens from Ban Namone, Xayabouly have no male genital organs (penis, retrator muscle, vas deferens and prostate gland), while female genital organs are well developed and fully function (Fig. 8D). This is apparently the first report of aphallic animals in Streptaxidae. The other two specimens from Ban Namone, have a ‘normal’ penis, but have an enlarged and curved “vaginal caecum (vc)” near the penis and atrium junction (Fig. 8B, C). This too is an unusual or unique structure in Streptaxidae. Nevertheless, all these animals appear conspecific based on their shells and the causes of this variation are unknown.
**Haploptychius porrectus** (Pfeiffer, 1863)
Figs 1, 2B, 3D–F, 7C, D, 9G–M, 10H; Table 1

*Streptaxis porrecta* Pfeiffer 1863 [1862]: 273. Type locality: Lao Mountains, Camboja [Cambodia]. Martens 1867: 85. Pfeiffer 1868: 442. Tryon 1885: 74. Fischer 1891: 18. Gude 1903: 217. Gude 1903: 275, 322, 325, pl. 12, fgs 20–22.

**Haploptychius porrectus**—Kobelt 1906: 133, pl. 61, fgs 24–26. Richardson 1988: 219.

**Material examined.** This species was described from the H. Cuming collection. The number of specimens was not indicated, but only one set of measurements was given in the original description. The NHM collection contains two specimens from the Cuming collection that has Pfeiffer’s handwritten label stating the species name and collection locality. In order to stabilize the name, a specimen matching with the measurements given in the original description is designated here as lectotype NHMUK 20140750.1 (Fig. 3D; H = 8.0, W = 9.0). The other specimen from the same lot becomes a paralectotype NHMUK 20140750.2 (1 shell; Fig. 3E; H = 8.0, W = 8.2).

Laos: NHMUK 1906.1.1.770 (4 shells), NHMUK MacAndrew coll. (2 shells). Ban Nong Tang, Phoukood, Xieng Khuang, Laos: CUMZ 6273 (18 shells; Fig. 3F), 6274 (1 specimen in ethanol; Figs 2B, 7C, D). Tam Pew, Kham, Xieng Khuang, Laos: CUMZ 6275 (4 specimens in ethanol; Figs 9G–M, 10H).

**Description. Shell.** Shell oblique-heliciform, white and translucent. Whorls 6½, spire conical, suture distinct. Shell surface glossy, with transverse ridges that diminish below the periphery. Embryonic shell smooth with 2½ whorls; following whorls regularly coiled. Penultimate whorl rounded; last whorls rounded and axially deflected. Aperture subcircular; peristome thickened and reflected. Aperture dentition with one parietal lamella. Umbilicus open and deep (Fig. 3D–F).

**Radula.** Each row consists of 46–58 teeth with formula (23-29)-1-(23-29). Central tooth very small and triangular, with a pointed cusp. Lateral and marginal teeth undifferentiated, lanceolate, unicuspid. Latero-marginal teeth gradually reduce in size, with outermost teeth much smaller and shorter than inner teeth (Fig. 10H).

**Genital organs.** Atrium (at) short. Proximal penis (p) stout about one-fifth of penis length; distal penis slender. Penial sheath (ps) thin, extending about two thirds of penis length; penial sheath retractor muscle (psr) very thin, originating at atrium and inserting distally on penial sheath (Fig. 7C). Vas deferens (vd) passes through about a quarter of the penial sheath length before entering into penis apically (Fig. 7D). Penial retractor muscle (pr) thick, short and connected with penis apically.

Internal wall of atrium generally smooth (Fig. 9G). Proximal penial wall densely covered with brownish penial hooks, about 10 hooks/200 $\mu$m$^2$. Hooks located on low conical penial papillae, separated by very thin reticulated folds. Proximal penial hooks small and short (< 0.04 mm in length), slightly expanded at base, tip sharp and directed towards genital orifice (Fig. 9H, I). Distal penial wall less densely scattered with brownish penial hooks, about 4 hooks/200 $\mu$m$^2$; penial papillae absent. Distal hooks
very large, long and slender (< 0.5 mm in length), expanded at base, tip obtuse and
directed towards genital orifice (Fig. 9J, K).

Vagina (v) short, about half of penis length. Gametolytic duct (gd) long tube ex-
tending as far as albumin gland; gametolytic sac (gs) small. Free oviduct (fo) short with
almost the same diameter as vagina. Oviduct (ov) enlarged and folded; prostate gland
inconspicuous and bound to oviduct. Talon (ta) small and club shape. Hermaphrodit-
ic duct (hd) bearing very long and enlarged seminal vesicle (sv) about ten times longer
than the length from talon to branching point of seminal vesicle (Fig. 7C).

Vaginal wall generally corrugated with irregular vaginal papillae (Fig. 9L, M). Vaginal hooks absent.

**Distribution.** This species is known from the limestone outcrops in northeastern
and central parts of Laos. The animals can be found at altitudes from 150-300 meters
above mean sea level.

**Remarks.** This species can be distinguished from *H. dorri* (Dautzenberg, 1894)
and *H. blaisei* (Dautzenberg & Fischer, 1905) in having a less depressed shell and less
deviated last whorl. In addition, *H. blaisei* possesses a solid shell with an angular penul-
timate whorl, and *H. dorri* has a smaller and smooth shell with an angular penultimate
whorl. *Haploptychius anceyi* (Mabille, 1887) is similar to *H. porrectus*, however it differs
in its smaller shell, circular aperture, and nearly smooth shell surface.

**Haploptychius fischeri** (Morlet, 1887)

Fig. 3G

*Streptaxis fischeri* Morlet 1887 [1886]: 259, 274, pl. 12, fig. 1, 1a. Type locality: Baie
d’Halong et Montagne de l’Éléphant [Elephant Mountain of Halong Bay, Quang
Ninh Province, Vietnam]. Gude 1903: 212.

*Haploptychius fischeri*—Kobelt 1906: 136, pl. 61, fig. 21, Richardson 1988: 215. Schi-leyko 2011: 25.

**Material examined.** The species was described based on material from Jourdy’s collec-
tion and an illustration was included in the original description (Morlet 1887: 259,
pl. 12, fig. 1, 1a). There is a single specimen from L. Morlet in the MNHN collections
with an original label stating “Type”. In order to stabilize the name, a shell that
matched well with the illustration and measurements given in the original description
is designated here as lectotype MNHN-IM 200030873 (Fig. 3G).

**Remark.** *Haploptychius fischeri* is currently known only from the north of Vietnam
(Schileyko 2011, Do and Do 2015). The type specimen was examined. Shell thick-
ened, oblique-heliciform with depressed spire. Shell surface with strong radial ridges;
apenultimate whorl rounded; last whorl axially deflected. Aperture subquadrangular,
parietal lamella strong and parietal callus thickened. Peristome wide; lip thickened and
reflected. Umbilicus narrowly open.
Compared with *H. pellucens* and *H. porrectus*, this species differs in its larger and thicker shell, depressed spire, prominent transverse ridges, subquadrangular aperture, thicker parietal lamella, and narrower umbilicus.

**Haploptychius blaisei** (Dautzenberg & Fischer, 1905)
Figs 1, 4D–F; Table 1

*Streptaxis blaisei* Dautzenberg and Fischer 1905: 86, 87, pl. 3, figs 1–4. Type locality: Ile Krieu, Tonkin [Krieu Island, Ha Long, Quang Ninh Province, Vietnam].

*Haploptychius blaisei*—Kobelt 1906: 173, pl. 66, figs 4–7. Richardson 1988: 212.

**Material examined.** The original description was based on single specimen since stated “un seul examplaire” (a single example). The specimen of M. Blaise in the MNHN collections is considered as holotype MNHN-IM 200030866 (Fig. 4D).

Phu Ly, Dongson, Ha Nam, Vietnam: NHMUK Vermeulen coll. (4 shells). Tam Phatok, Ngoi, Luang Phrabang, Laos: CUMZ 6276 (1 shell; Fig. 4E), 6257 (15 shells; Fig. 4F).

**Remarks.** Shell oblique-heliciform, white and translucent. Whorls 6½; spire depressed to slightly convex, with distinct suture. Shell surface glossy, with thin transverse ridges that diminish below periphery and around umbilicus. Embryonic shell large, about 2½ whorls, with a smooth surface; following whorls regularly expanded. Penultimate whorl rounded; last whorl axially deflected. Aperture semi-ovate; peristome discontinuous, parietal callus thin; lip thickened and slightly expanded. Apertural dentition with one strong parietal lamella. Umbilicus widely open and shallow.

*Haploptychius blaisei* is superficially similar to *H. diespiter* (Mabille, 1887) and *H. dorri* from north Vietnam, but it has a larger shell, more depressed spire, rounded penultimate whorl, a wide and deep umbilicus, and thin transverse ridges on the upper periphery. For comparison, *H. diespiter* (Fig. 4B) has the last whorl less deviated from the vertical axis, and *H. dorri* (Fig. 4C) has a more depressed suture.

**Genus Perrottetia** Kobelt, 1905

*Odontartemon* (*Perrottetia*) Kobelt 1905: 91. Kobelt 1906: 108. Thiele 1931: 730. Forcart 1946: 215.

*Oophana* (*Perrottetia*)—Benthem Jutting 1954: 95.

*Perrottetia*—Zilch 1960: 562, 563, Richardson 1988: 237. Schileyko 2000: 777, 778. Siriboon et al. 2013: 44, 45.

**Type species.** *Helix peroteti* Petit, 1841, by subsequent designation of Forcart (1946: 215).
The first revision of the carnivorous land snail family Streptaxidae in Laos...

Figure 4. Shells of Haplopychius spp. A Haplopychius anceyi lectotype MNHN-IM 200030868 B Haplopychius diespiter syntype MNHN-IM 200030870 C Haplopychius dorri syntype MNHN-IM 200030869 D–F Haplopychius blaisei D holotype MNHN-IM 200030866 and E, F specimens from Luang Phrabang CUMZ 6257.

Remarks. The genus Perrottetia differs from all other Southeast Asian streptaxid genera in having two longitudinal furrows outside the aperture. Apertural dentition usually comprises one or two parietal lamellae, plus, palatal, basal and columellar lamellae. Genitalia with long penis, penial hooks present, and vaginal hooks sometimes present (Zilch 1960, Schileyko 2000, Siriboon et al. 2013).

Currently, 29 Perrottetia species are recognized, from India and Sri Lanka to Indochina and southern China (Kobelt 1906, Richardson 1988, Schileyko 2011, Siriboon et al. 2013). Two species have been reported from Laos, P. dugasti (Morlet, 1892) and P. daedaleus (Bavay & Dautzenberg, 1908) (see Schileyko 2011).
**Perrottetia dugasti** (Morlet, 1892)

Fig. 5A

*Streptaxis dugasti* Morlet 1892: 82. Morlet 1893[1892]: 315, 316, pl. 7, fig. 5, 5a, 5b.  
Type locality: Lai-Chau, sur les bords de la Rivière Noire, Tonkin [on the banks of the Black River, Lai Chau Province, Vietnam]. Gude 1903: 255.  
*Perrottetia dugasti*—Kobelt 1906: 123, 124, pl. 61, fig. 13. Richardson 1988: 239. Schileyko 2011: 23.

**Material examined.** The species was described based on material from L. Dugast collection but no illustration was given. Morlet (1893: 315, 316, pl. 7, fig. 5, 5a, 5b) subsequently published the description and illustrated a single specimen. There is a specimen of *L. Morlet* in the MNHN collections with an original label stating “Type”. In order to stabilise the name, the shell that closely matched with the measurements given in the original description and illustration in Morlet (1893: pl. 7, fig. 5, 5a, 5b) is here designated as lectotype MNHN-IM 200030867 (Fig. 4A).

**Remarks.** Shell sub-oblique heliciform with depressed spire and 6 whorls. Shell surface smooth, glossy and with a distinct suture. Embryonic shell smooth, following whorl regularly expanded. Last whorl rounded, axially deflected, with longitudinal furrows present. Aperture narrow; peristome discontinuous, thick and expanded, and short sinulus present. Aperture dentition consisting of two parietal lamellae (lower one large; upper one small and close to sinulus), one palatal lamella, one basal lamella and one bifid columellar lamella.

Compared with *P. messageri* (Bavay & Dautzenberg, 1908), this species differs in having a strong lower parietal lamella, a bifid columellar lamella, and the left periphery of penultimate whorl not extended beyond the diameter of the last whorl. In contrast, *P. messageri* has a strong columellar lamella, a supracolumellar lamella is present, and the left periphery of the penultimate whorl extended beyond the diameter of the last whorl (Fig. 5D).

**Perrottetia daedaleus** (Bavay & Dautzenberg, 1908)

Fig. 5C

*Streptaxis daedaleus* Bavay and Dautzenberg 1908: 230. Type locality: Pac-Kha [Pa Kha, Son La Province, Vietnam]. Bavay and Dautzenberg 1909: 164, 165, pl. 4, figs 1–4.  
*Streptaxis daedaleus* var. *major* Bavay and Dautzenberg 1908: 231. Type locality: Pac-Kha [Pa Kha, Son La Province, Vietnam]. Bavay and Dautzenberg 1909: 165.  
*Oophana daedaleus*—Richardson 1988: 234. Schileyko 2011: 23.  
*Oophana daedaleus major*—Richardson 1988: 234.

**Material examined.** Syntype of *Streptaxis daedaleus* var. *major* MNHN-IM 200030871 (Fig. 5B). Tonkin: NHMUK 1909.6.9.118-9 (2 shells). Pac-Kha, Tonkin: NHMUK
Figure 5. Shells of Perrottetia spp. A Perrottetia dugasti lectotype MNHN-IM 200030867 B Perrottetia mabillei syntype MNHN-IM 200030874 C Perrottetia daedaleus var. major syntype MNHN-IM 200030871 D Perrottetia mesageri syntype MNHN-IM 200030875 E Perrottetia aquilonaria specimen CUMZ 6278 from Xayabouly with apertural dentition F, G Perrottetia unidentata sp. n. F holotype CUMZ 6281 with apertural dentition and G paratype CUMZ 6282 H, I Perrottetia unidentata sp. n. specimens from Tam Than Kaisone H specimen with upper palatal CUMZ 6284 and I specimen without upper palatal CUMZ 6285.
1909.7.9.15-6 (2 shells), NHMUK Preston coll. date 7.4.09 (2 shells), Rolle coll. date 27.11.09 (3 shells). Long Ping, Tonkin: NHMUK Rolle coll. date 27.1.09 (2 shells).

**Remarks.** Shell suboblique-heliciform with a convex spire and 6 whorls. Shell surface with strong transverse ridges running continuously to umbilicus. Embryonic shell with thin transverse ridges and following whorl regularly expanded. Last whorl rounded, axially deflected, longitudinal furrows present. Aperture triangular; peristome discontinuous, thickened, broadly expanded and sinulus absent. Apertural dentition with two parietal lamellae (lower one small; upper one large and close to sinulus), one angular lamella, one palatal lamella (located far inside aperture) and one columnellum lamella.

This species is superficially similar to *P. mabillei* (Bavay & Dautzenberg, 1903) in having strong transverse ridge over the entire shell, but *P. daedaleus* has a large upper parietal lamella, a palatal lamella located inside the aperture, and strong columnellum lamellae, while *P. mabillei* (Fig. 5B) has a large lower parietal lamella and bifid columnellum lamellae.

*Perrottetia aquilonaria* Siriboon & Panha, 2013
Figs 1, 5E

*Perrottetia aquilonaria* Siriboon et al. 2013: 50–52, figs 3D–H, 4D–F: Type locality: Wat Tam Pha Plong, Chiangdao, Chiangmai, Thailand.

**Material examined.** Holotype CUMZ 5003, paratypes CUMZ 5004 (4 shells). Ban Namone, Xayabouly, Laos: CUMZ 6278 (2 shells; Fig. 5E), CUMZ 6279 (1 specimen in ethanol). Ban Bo Khoun, Boun Neua, Phongsaly, Laos: CUMZ 6280 (1 shell).

**Remarks.** *Perrottetia aquilonaria* was described from several localities in the northeastern part of Thailand with a complete information on shell, radula and genitalia. The specimens collected from limestone outcrops in Borkeo and Phongsaly of Laos have both shells and genitalia that match very well with this species. Laos specimens seem to differ only in the slightly smaller shell, therefore we treated them as the same species.

*Perrottetia aquilonaria* can be distinguished from *P. dugasti* and *P. messageri* from Vietnam by having a depressed spire, shouldered last whorl, thin parietal callus and upper-parietal lamella separated at a right angle. In contrast, *P. dugasti* has a rounded last whorl and a small upper-parietal lamella located deeper inside the aperture, and *P. messageri* has paralleled parietal lamellae, a small supercolumnellum lamella is present, and the left side of the penultimate whorl extended beyond the diameter of the last whorl (Fig. 5A, D).

*Perrottetia unidentata* Inkhavilay & Panha, sp. n.

Figs 1, 5F–I, 7E, F, 10A–F, I; Table 1

**Type material.** Holotype CUMZ 6281 (Fig. 5F). Measurement: shell height 5.3 mm, shell width 9.7 mm and 6½ whorls. Paratypes CUMZ 6282 (4 shells; Fig. 5G), CUMZ 6283 (1 specimen in ethanol; Figs 7E, F, 9A–F, I), NHMUK 20160250 (2 shells).
Other material examined. Tam Than Kaisone, Viengxay, Houaphanh, Laos: CUMZ 6284 (5 shell; Fig. 5I), CUMZ 6285 (2 shells; Fig. 5H).

Type locality. The limestone outcrop at Ban Nawit, Viengxay, Houaphanh, Laos (20°22′37.3″N, 104°16′43.2″E) about 700 meters above mean sea level.

Diagnosis. This new species differs from *P. daedaleus*, *P. aquilonaria*, *P. dugasti* and *P. messageri* from Vietnam in having an oblique shell, a single parietal lamella, widely expanded lip, the last whorl strongly axially deflected, the left side of penultimate whorl well extended beyond the diameter of last whorl, and the distal end of penis with a wing-like structure. The other four species have two parietal lamellae, the last whorl little axially deflected and the left side of penultimate whorl not extended beyond the diameter of the last whorl. For further comparison, *P. daedaleus* has an elevated spire, transverse ridges over the entire shell and a basal lamella located deep inside aperture (Fig. 5C); *P. aquilonaria* has a smaller shell, elevated spire, bifid collumellar lamella, and genitalia with atrial pores and vaginal hooks absent (Fig. 5E); *P. dugasti* and *P. messageri* have a smooth shell surface, a bifid collumella lamella and a supracolumellar lamella (Fig. 5A, D). *Perrottetia gudei* from north Vietnam differs from the new species in having an elevated spire, in being less deviated from the vertical axis, and in having thin transverse ridges (see Siriboon et al. 2013).

Description. Shell. Shell oblique-heliciform, semi-transparent; whorls 6½, spire weakly convex with distinct suture. Shell surface glossy with strong transverse ridges on upper shell surface. Embryonic shell large, about 2½ whorls, with a smooth surface; following whorls regularly coiled. Shell periphery shouldered; last whorl axially deflected; two deep longitudinal furrows present. Aperture semi-ovate; peristome discontinuous; parietal callus thin; lip thickened, broadly expanded and slightly reflected. Apertural dentition with one large, strong and sinuous parietal lamella, one small uper palatal lamella, one palatal lamella, one large basal lamella, one strong collumellar lamella, and one small supracolumellar lamella. Umbilicus widely open and shallow (Fig. 5F–I).

Radula. Each row consists of 26–38 teeth with formula (13-19)-1-(13-19). Central tooth small and triangular, with pointed cusp. Lateral and marginal teeth undifferentiated, lanceolate, unicuspid. Latero-marginal teeth gradually reduce in size, with outermost teeth much smaller and shorter than inner teeth (Fig. 10I).

Genital organs. Atrium (at) short. Proximal penis (p) long and slender; distal part near retractor muscle with an expanded wing-like structure (a flat blade on either side of the penis, each about one-tenth of penis length). Penial sheath (ps) thin and extending about one-third of penis length; penial sheath retractor muscle (psr) very thin, originating at atrium and inserting distally on penial sheath (Fig. 7E). Vas deferens (vd) passes through about one-third of penial sheath length before entering into penis apically (Fig. 7F). Penial retractor muscle (pr) thin and long, inserted at penis and vas deferens junction.

Internal wall of atrium generally smooth (Fig. 10A). Penial wall densely covered with light brown penial hooks, about 20 hooks/200 μm²; hooks located on low elliptical penial papillae. Penial hooks small (< 0.1 mm in length), slender, expanded at base, tips pointed and curved towards genital orifice (Fig. 10B–D).
Vagina (v) short, about one-tenth of penis length. Gametolytic duct (gd) a long tube extending as far as albumin gland; gametolytic sac (gs) ovate. Free oviduct (fo) long and cylindrical with equivalent diameter to vagina, tapering distally. Oviduct (ov) enlarged and folded; prostate gland inconspicuous and bound to oviduct. Talon (ta) very small, short and club shape. Hermaphroditic duct (hd) bearing very short and thin seminal vesicle (sv) about one and half times longer than the length from talon to branching point of seminal vesicle (Fig. 7E).

Vaginal wall with transparent vaginal hooks (about 10 hooks/200 $\mu$m$^2$). Hooks located on low conical vaginal papillae. Vaginal hooks small (< 0.1 mm in length), short and expanded at base; tips pointed and straight to slightly curving away from genital orifice (Fig. 10E, F).

**Etymology.** The specific epithet “unidentata” derived from the Latin words “unus” meaning “one” and “dens” meaning “tooth”. It referred to a single parietal lamella (or teeth) of the new species.

**Distribution.** This species is known only from the type locality, Houaphanh, a limestone karst area.

**Remarks.** Shell variation is evident from specimens from Tam Than Kaisone, about 20 km west of the type locality (Fig. 5H, I; CUMZ 6284, 6285). They are smaller, with a sinuous parietal lamella, and sometimes lack the upper palatal lamella (Table 1). However, only five shells and no living specimens were collected, so we provisionally identifying them as the same species.

**Perrottetia megadentata** Inkhavilay & Panha, sp. n.
http://zoobank.org/3DE66E56-8480-4993-91C8-47E885EE2C4D
Figs 1, 6A, B; Table 1

**Type material.** Holotype CUMZ 6286 (Fig. 6A). Measurement: shell height 7.1 mm, shell width 8.2 mm, and with 6 whorls. Paratypes: CUMZ 6287 (31 shells; Fig. 6B), CUMZ 6288 (2 shells), NHMUK (2 shells), NUOL 20160251 (2 shells), SMF (2 shells).

**Type locality.** The limestone outcrop at Ban Phone Can, Yommalat, Khammouan, Laos (17°31'35.6"N, 105°9'40.7"E)

**Diagnosis.** The characters distinguishing *Perrottetia megadentata* sp. n. from *P. daedaleus*, *P. aquilonaria*, *P. dugasti* and *P. mabillei* are a single large parietal lamella, the absence of a palatal lamella absent and the presence of an infra-columellar lamella. The other four species have two parietal lamellae and a palatal lamella. Furthermore, *P. dugasti* and *P. aquilonaria* have a smooth shell, slightly depressed spire, and a bifid columellar lamella (Fig. 5A, E). *Perrottetia daedaleus* and *P. mabillei* have strong transverse ridges over the entire shell, a palatal lamella, and a bifid basal lamella, a columellar lamella is absent in *P. mabillei* (Fig. 5B), while one basal and one columellar lamella are present in *P. daedaleus* (Fig. 5C). The new species differs from *P. unidentata* sp. n. in its ovate shape, smooth shell surface, thicker shell, in the absence of a palatal lamella, and in having infra- and supra-columellar lamellae.
The first revision of the carnivorous land snail family Streptaxidae in Laos...

The new species is superficially similar to *P. dermapyrhosa* Siriboon & Panha, 2013, but is distinguished by having a single and large parietal lamella, and in the absence of a palatal lamella.

**Description.** Shell oblique-ovate, white and translucent; whorls 6, spire conical, with distinct suture. Shell surface glossy with transverse ridges near suture. Embryonic shell large, about 2½ whorls, with a smooth surface; following whorls regularly
coiled. Shell periphery rounded; last whorl axially deflected; two shallow and short longitudinal furrows present. Aperture subcircular, peristome continuous; parietal cal- lus thickened; lip thickened, expanded and reflected; short sinulus present. Apertural dentition with very large and strong sinuous parietal, one large basal lamella located deep inside aperture, one small infracolumellar lamella, one large columellar lamella, and one small supracolumellar lamella. Umbilicus widely open and deep (Fig. 6A, B)

**Etymology.** The specific epithet “megadentata” is derived from the Greek word “mega” meaning “large” and the Latin word “dens” meaning “tooth”. It referred to the single large parietal lamella of the new species.

**Distribution.** This species is known only from the type locality in central Laos.

**Remarks.** To date no living specimens have been collected.

**Genus Indoartemon Forcart, 1946**

*Oophana (Indoartemon)* Forcart 1946: 215. Benthem Jutting 1954: 95.

*Indoartemon*—Zilch 1960: 562. Richardson 1988: 223. Schileyko 2000: 776, 777. Siriboont et al. 2014b: 162.

**Type species.** *Streptaxis eburnea* Pfeiffer, 1861, by original designation.

**Remarks.** The genus *Indoartemon* can be recognized by the dentition, which consists of one parietal and one palatal lamella (a basal lamella is also present in some species). The penis is long, with a thin penial sheath extending about half of the penis length, through which the vas deferens does not pass. Penial hooks are present (Siriboont et al. 2014b).

Currently, ten species are recognized, of which seven were reported from Indo- china south of China and Hainan. Only one species, *I. tridens* (Möllendorff, 1898) has previously been recorded from Laos (Richardson 1988, Schileyko 2000, Siriboont et al. 2014b); here we describe another.

**Indoartemon tridens** (Möllendorff, 1898)

Figs 1, 6C

*Streptaxis tridens* Möllendorff 1898: 67. Type locality: Boloven, Laos [=Boloven Pla- teau, Paksong, Champasak, Laos]. Gude 1903: 220.

*Odontartemon tridens*—Kobelt 1905: 94, 95, pl. 58, figs 19, 20.

*Indoartemon tridens*—Zilch 1961: 85, pl. 5, fig. 15. Richardson 1988: 225. Schileyko 2011: 23.

**Material examined.** Holotype SMF 108507 (Fig. 6C).

**Remarks.** Shell oblique-ovate with 5½ whorls, semi-transparent, spire slightly convex, with distinct sutures. Shell surface glossy white with thin growth lines; following whorls regularly coiled. Last whorl axially deflected. Aperture triangular; peristome con-
Figure 7. Genitalia of *Haploptychius* and *Perrottetia* species. CUMZ 6283 E reproductive system, and F insertion of vas deferens into penial sheath.
tinuous; lip thickened, little expanded and slightly reflected. Apertural dentition with one large parietal lamella, one palatal lamella, and one small bifid columellar lamella.

Only the type specimen was examined. *Indoartemon tridens* differs from *I. eburneus*, *I. prestoni* (Gude, 1903) and *I. medius* Siriboon & Panha, 2014 from Thailand by having a bifid columellar lamella, an ovate-heliciform shape, its smooth shell surface, narrow umbilicus, and having the left side of penultimate whorl extended beyond the diameter of last whorl. For comparison, *I. eburneus* and *I. prestoni* have a less deviated last whorl, transverse ridges on the shell, and a widely open umbilicus; *I. medius* has an angular penultimate whorl and strong transverse ridges.

**Indoartemon diodonta** Inkhavilay & Panha, sp. n.

http://zoobank.org/64F31C73-88D6-4A6B-BD0C-09FE2663E28F

Figs 1, 6D–F; Table 1

**Type material.** Holotype CUMZ 6289 (Fig. 6D). Measurement: shell height 7.5 mm, shell width 8.3 mm, and with 7 whorls. Paratypes: CUMZ 6290 (44 shells; Fig. 6E), NHMUK 20160252 (2 shells), NUOL (2 shells), SMF (2 shells).

**J** arrangement of penial hooks in proximal area **K** lateral view of penial hook in proximal area **L** arrangement of papillae and vaginal folds, and **M** arrangement of vaginal folds.
Other material examined. Tam Nang Ann, Tha Khek, Khammouan, Laos: CUMZ 6291 (7 shells, Fig. 6F). Tam Xieng Lieb, Tha Khek, Khammouan, Laos: CUMZ 6292 (15 shells).

Type locality. Tam Xang, Tha Khek, Khammouan, Laos, 17°25’44.0"N, 104°51’49.1"E.

Diagnosis. This new species superficially resembles I. eburneus and I. prestoni from Thailand, but it differs in having a much smaller shell, an oblique-heliciform shape, open umbilicus, and the last whorl is strongly deviated from the vertical axis. This species differs from I. medius from Thailand in its smaller shells, angular penultimate whorl and thin transverse ridges. Indoartemon diodonta sp. n. differs from I. bidens (Möllendorff, 1883) from Hainan and I. tridens by having fine transverse ridges on the upper periphery, and the last whorl is less deviated from the vertical axis. These two
species also have a smooth shell surface and a more strongly deviated last whorl, and a bifid columnar lamella is present in \textit{I. tridens}.

description. shell. Shell oblique-heliciform, white and translucent; whorls $6\frac{1}{2}$–7, spire conical, with distinct suture. Shell surface dull, with fine transverse ridges that diminish below the periphery. Embryonic shell large, about $2\frac{1}{2}$ whors, with smooth surface; following whors regularly coiled. Last whorl shouldered, axially deflected, and not expanded. Aperture subcircular; peristome continuous, parietal callus thickened; lip thickened, expanded and little reflected. Apertural dentition with one large and strong parietal and one small palatal lamellae. Umbilicus narrow and deep (Fig. 6D–F).

etymology. The specific epithet “diodonta” is derived from the Greek words “di” meaning “two” and “odontos” meaning “tooth”, referring to the dentition of the new species.

distribution. This species is known from limestone karst in Khammouan Province, central Laos. The animals can be found at altitudes up to 140 meters above mean sea level.

remarks. To date no living specimens have been collected.

discussion

This study increases the number of streptaxid species recorded from Laos to twelve, three of which are new. Streptaxids occur in both limestone and non-limestone areas in the central and northern parts of Laos. The fauna apparently remains less diverse than that of Thailand and Vietnam (Panha 1996, Hemmen and Hemmen 2001, Siriboon et al. 2013, 2014a, b, Schileyko 2011). The highly modified habitats of southern and some central areas of Laos may harbour a lower species diversity. For example, \textit{Indoartemon tridens} was recorded in 1898 by Möllendorff from its type locality at Boloven plateau, Pakson, Champasak, Laos, but our surveys yielded no specimens collected from this locality.

The species can be separated by geography, shell morphology, and (where available) genital anatomy. Two species from the genus \textit{Haploptychius}; \textit{H. pellucens} and \textit{H. porrectus} were described from Laos by Pfeiffer (1863). From our results living and shells specimens of \textit{H. pellucens} and \textit{H. porrectus} were collected from nine sampling sites in six provinces such as Louang Namtha, Oudomxay, Louang Phrabang, Xayabouly, Bolikhmaxay and Xieng Khaung. Shell morphology and genitalia anatomy were compared between the two species. The two can be separated by having different shell size and shape, as well as differences in the penial sheath, penial hooks, and vaginal wall. The southernmost population of \textit{H. pellucens} is particularly small. Most records of \textit{Haploptychius} species are from northern Laos, latitude $18^\circ$–$21^\circ$.

\textit{Perrotettia unidentata} sp. n. and \textit{P. megadentata} sp. n. are the first two species of the genus recorded in Laos, and are geographically and altitudinally separated. \textit{Perrotettia unidentata} sp. n. occurs in northern Laos close to the Lao-Vietnam border at over 700 m above sea level, while \textit{P. megadentata} sp. n. occurs far to the south and lower than 200 m above sea level (Fig. 1). The two species can be separated by shell morphology. \textit{Perrotettia} has been collected from central to northern Laos, latitude $18^\circ$–$22^\circ$. 
Indoartemon diodontia sp. n. is the second species of this genus recorded from Laos after *I. tridens* (Möllendorff 1898). The new species was found in central Laos, while the first was found in southern Laos, at over 1000 m above sea level. In Laos, *Indoartemon* has now been recorded between latitude 14°–18°.

Acknowledgements

The authors are grateful to members of the Animal Systematics Research Unit, Chulalongkorn University (ASRU) members for kind help during field collecting. For accommodation and technical supports during this study we cordially thank all staff in the Department of Biology, Faculty of Science, Chulalongkorn University. Special thanks are offered to the Faculty of Natural Science, National University of Laos for the kind preparation of permission documents during surveys and data collection in Laos. The authors would like to express our gratitude for the comments from anonymous referees that encourage to improve the manuscript. We are also indebted to the M. Caballer project E-RECOLNAT: ANR-11-INBS-0004 for their support with the type material database. This project was mainly funded by the TRF Senior Research Scholar (RTA 5880002) to SP, and additionally supported from Chulalongkorn University Graduate School Postdoctoral Project to TS and CU-ASEAN scholarship to KI.
