Annex 1 Terminology

Telehealth: Use of electronic and telecommunications technologies to support and promote long-distance clinical health care, patient and professional health-related education, and public health and administration.  

Telemedicine: It is a virtual outpatient service, which has gained greater stimulus as a health care model since 2020, due to the COVID-19 pandemic, and it provides a possibility of safe continuous health care, and there will be no need for face-to-face meeting. It is performed through teleconsultations. This methodology favors people with lower purchasing power, people who live long distances from health centers, favors the offer of consultations and decreases the number of people in waiting rooms and receptions. So that health centers can offer quality telemedicine, they need to include in their facilities, quality communication technologies so that they can securely guarantee remote health care.  

Teleconsultation: Methodology used to carry out telemedicine. It can be through video calls, phone calls, video conferences and electronic messages.  

Wearables: Wearable devices (wearables) are revolutionizing biomedicine through mobile and digital health by enabling continuous, longitudinal health monitoring outside of the clinic.
