**ABSTRACT**

At the heart of current research is the battle for more efficient and less toxic treatment approaches for diseases. Pyrazole and its derivatives have emerged as an influential scaffold that has drawn the attention of researchers in the field of medicinal chemistry due to its appreciable diversity in biological activities. Pyrazole derivatives have found numerous applications in fluorescent substances, dyes, and agrochemicals. Pyrazole is a multifunction lead compound for efficient biologically active molecules generated by researchers. They have shown a widespread biological and pharmacological activity such as antitumor, analgesic, anti-inflammatory, antimicrobial, antitubercular, antileishmanial activity, ACE inhibitors, antidiabetic, antiparkinsonian and neuroprotective properties. This rational diversity in the pattern of physiological reaction has led many scientists, with far more successful pharmacological intervention, to refine and create new structural alternatives. This Review is important for previous studies and initiatives to explore in the near future the various activities of compounds associated with pyrazole and pyrazole derivatives.

**Keywords:** Pyrazole, Pyrazole Derivatives, Anti-cancer, Anti-tubercular, Anti-inflammatory, Analgesic, Antimicrobial, Antiviral, Enzyme inhibitors.

**INTRODUCTION**

**PYRAZOLE**

Pyrazoles constitute an essential class of natural and synthetic products, many of which exhibit flexible biological activity. Antitumor, herbicides, antibacterial, antifungal, hypoglycemic, antidepressant, analgesic, anti-inflammatory, anti-cancer, enzyme inhibitor activity are shown among the pyrazoles. As represented by the molecular formula, Pyrazole is a five-membered ring structure consisting of three carbon atoms and two nitrogen atoms in adjacent positions. The word pyrazole was first coined by Ludwig Knorr in 1883. They are known as alkaloids because of their structures and unique pharmacological effects on human beings. 1-pyrazolylalanine was the first natural pyrazole isolated from watermelon seeds in the year 1959.  

One that possesses a cyclic structure with at least one heteroatom in the ring is a heterocyclic compound. The most popular heteroatoms are Nitrogen Oxygen and sulphur. In nature, heterocyclic compounds are very widely distributed and important to life in different ways. As is evident from a large number of publications covering their preparation and use, pyrazole constitutes a class of compounds synonymous with widespread use in the field of medicine and agrochemistry. With a melting point of 70°C, Pyrazole is a colourless solid. This high value is due to intermolecular hydrogen bonding that results in a dimmer (compared with 1-alkyl or aryl-substituted pyrazoles). Pyrazole is a tautomeric substance: in pyrazole itself, the presence of tautomerism cannot be shown but can be inferred by considering pyrazole derivatives. Pyrazole exhibits aromatic properties, e.g., it is readily halogenated, nitrated and sulphonated; the group enters at position 4. The following resonating structures are possible for pyrazole.

Pyrazole has a weak base and forms salts with inorganic acids; it is possible to substitute imino hydrogen with an acyl group. Pyrazole is highly resistant to oxidizing and reducing agents, but can be catalytically hydrogenated, first with pyrazoline and then with pyrazolidine. But stronger bases than pyrazole are among these compounds.
There are two nitrogen atoms in a five-membered ring in the aromatic organic heterocycle containing pyrazole scaffolds. Pyrazole derivatives are essential in the family of aromatic organic heterocycles. Numerous uses for fluorescent agents, dyes, agrochemicals, and more have been found in pyrazole derivatives. Pyrazole is a multipurpose lead compound for efficient biologically active T-molecules formed by chemical architecture. They have shown a widespread biological and pharmacological activity such as antitumor, anti-inflammatory, antimicrobial, antidepressant antifungal, antimalarial, enzyme inhibitors, antidiabetic, antiinflammatory.

In organic chemistry, the chemistry of heterocyclic compounds remains a blossoming field. One of the heterocyclic compounds is Pyrazole. In the history of heterocyclic chemistry, pyrazole derivatives have played a crucial role and have been extensively studied due to their ready accessibility, diverse chemical reactivity, and extensive biological activity. Pyrazole derivatives are widely applicable in different areas, i.e. Industry, rehabilitation and cultivation in medicine.

In the textile industry, azopyrazolones are the most effective fabric dyes for dyeing cotton, silk, wool, polyester and acrylic fibres, as dyes for leather, rubber products, paint dyes, varnishes, lacquers, natural and synthetic polymers, inks, multi-color jet-printing and hair-dying creams. In rubber technology, the other application of pyrazoles is as anti-aging agents for light coloured rubbers. Pyrazoles are also used in colour photography as colour couplers, sensitizers, super-sensitizers, developers and colour filters. The derivatives of pyrazole are also used as anti-bacterial, diuretic, anti-hypertensive, anti-pyretic, analgesic, tranquilizer, anti-inflammatory, anti-convulsant, anti-thrombotic, anti-tumor and anti-tumor agents in medicinal therapy. In agriculture, pyrazole derivatives have also been used as fungicides, insecticides, pesticides, and herbicides etc. Like other nitrogen involving heterocycles, different tautomeric structures can be written for pyrazoles. The unsubstituted pyrazole has been represented by the following three tautomers with H prefixes to rationalize the nomenclature of the compounds containing this basic skeleton.

\[
\begin{align*}
1H\text{-pyrazole} & \quad 3H\text{-pyrazole} & \quad 4H\text{-pyrazole}
\end{align*}
\]

When the carbonyl group is adjacent to nitrogen atoms in the ring, according to the older system of nomenclatures these were named as 5- pyrazolone, pyrazolone-5, pyrazolone-5-one or 3-ones and later on 2- pyrazolin-5-one and the tautomer 3-pyrazolin-5-one.

\[
\begin{align*}
\text{Pyrazole} & \quad \text{Pyrazoline} & \quad \text{Pyrazidine}
\end{align*}
\]

**PROPERTIES OF PYRAZOLE**

Pyrazole has a five-membered aromatic ring structure consisting of two atoms of vicinal nitrogen, acidic pyrrole-like nitrogen with a single pair of aromatic electrons, simple sp²-hybridized nitrogen-like pyridine and three atoms of carbon, and these combined features must be carefully taken into account in the context of reactivity. In the first instance, N-unsubstituted pyrazoles possess amphoteric properties, acting as both acids and bases, considering the presence of nitrogen. While the proton is easily donated by the acidic pyrrole-like NH group, the simple pyridine-like nitrogen can accept protons even more readily, and thus the basic character is typically prevalent. Nevertheless, substitutions on the ring can modulate these properties, as, for instance, electron-donating groups were shown to increase the acidity of the pyrrole-like -NH group.

\[

\text{Pyrole-like nitrogen} & \quad \text{Acidic hydrogen}
\end{align*}
\]

Basic pyridine-like nitrogen (HB-acceptor)

In addition to the previous, the combination of two dissimilar and adjacent nitrogen atoms in this azole (-N-N(H)- moiety) allows it to simultaneously donate and accept hydrogen bonds, which favors the establishment of intermolecular interactions, either among pyrazole molecules themselves and the nature of the substituents in the ring or between pyrazoles and neighboring molecules that participate in proton transfer processes. Regarding the aggregation pattern of pyrazole in the solid-state, X-ray crystal studies unraveled the formation of linear catenmers as well as of cyclic dimers, trimers, tetramers and hexamers. In solution, both linear and cyclic oligomers can form, but in this case the associations between pyrazole molecules depend strongly on the type.
of solvent, since more polar protic solvents can divert the intermolecular interactions towards themselves, favoring the pyrazole-solvent hydrogen bonding rather than the formation of pyrazole-pyrazole clusters.\textsuperscript{12,13} In the gas-phase, and intermolecular interaction also needs to take place to allow for proton transfer, whether it occurs with another pyrazole molecule or with a third molecule, or even results from collisions with the analytical instrument’s walls.\textsuperscript{15} Pyrazole-based self-aggregates in the gas-phase have been detected by Infrared (IR) spectroscopy, for the parent pyrazole and 3,5-dimethyl pyrazole, as an equilibrium between monomers, dimers and trimmers.\textsuperscript{16} Also, several theoretical studies were performed regarding intermolecular interactions in pyrazoles, leading to proton transfers in the gas phase.\textsuperscript{17}

### Chemical Properties

The chemical properties of the pyrazole molecule can be explained by the effect of individual atoms. The N-atom at position-2 with two electrons is basic and therefore reacts with electrophiles. The N-atom at position-1 loses its proton in the presence of a base. The combined two N-atoms reduce the charge density at C-3 and C-5, making C-4 available for electrophilic attack. Deprotonation at C-3 can occur in the presence of a strong base, leading to ring-opening. Protonation of pyrazoles leads to pyrazolium cations that are less likely to undergo electrophilic attack at C-4, but an attack at C-3 is facilitated. The pyrazole anion is much less reactive towards nucleophiles, but the reactivity to electrophiles is increased.\textsuperscript{18} Some of the more general chemical properties of the pyrazole molecules are as follows:

#### Basic Character

Pyrazole is a weakly basic compound and form pyrazole hydrochloride salts with inorganic acids.\textsuperscript{19}

\[
\begin{align*}
\text{Pyrazole} + \text{HCl} & \rightarrow \text{Pyrazole-HCl} \\
\end{align*}
\]

#### Acylation

The introduction of the acyl or phenyl sulfonyl group into pyrazole nitrogen is usually achieved in the presence of a weak base such as pyridine. Thus, in acylation iminohydrogen atom of the pyrazole nucleus is replaced by an acyl group, to give N-acetyl pyrazole.\textsuperscript{19}

\[
\begin{align*}
\text{Pyrazole} + \text{CH}_3\text{COCl} & \rightarrow \text{Pyrazole-COCH}_3 \\
\end{align*}
\]

#### Oxidation

Pyrazoles are mostly stable to oxidation and only C-alkylated side chains are attacked by oxidizing agents alkaline KMnO\textsubscript{4} to yield the corresponding carboxylic acid pyrazole.\textsuperscript{20}

\[
\begin{align*}
\text{HMnO}_3 & \rightarrow \text{Pyrazole-COOH} \\
\end{align*}
\]

\[
\begin{align*}
\text{Pyrazole} + \text{C}_2\text{H}_5\text{OH} & \rightarrow \text{Pyrazole-CH}_3 \\
\end{align*}
\]

#### Halogenation

Halogenation of pyrazole gives 4-mono halo pyrazoles e.g. 4-chloro, 4-iodo or 4-bromo pyrazole under controlled conditions but poor yields are obtained on the reaction of isothiazole and isoxazole. Bromine will attack at C-4, but with activating groups, present halogenation proceeds better. 3,4,5-tribromo pyrazole is formed efficiently in an alkaline solution; presumably, the pyrazole anion is the reacting species.\textsuperscript{22}

\[
\begin{align*}
\text{Pyrazole} + \text{X}_2 & \rightarrow \text{Pyrazole-X} \\
\end{align*}
\]

#### Nitration

Pyrazole undergo straight nitration at C-4, it gives 1-nitropyrazole but this can be rearranged to 4-nitropyrazole in acid at low temperature.\textsuperscript{23}

\[
\begin{align*}
\text{Pyrazole} + \text{HNO}_3 \rightarrow \text{1-Nitro-1H-pyrazole} \\
\end{align*}
\]

#### Sulphonation

Pyrazole reacts with fuming sulphuric acid to yield pyrazole 4-sulphonic acid.\textsuperscript{24}

\[
\begin{align*}
\text{Pyrazole} + \text{H}_2\text{SO}_4 & \rightarrow \text{Pyrazole-4-sulphonic acid} \\
\end{align*}
\]

### APPLICATIONS OF PYRAZOLE AND PYRAZOLE DERIVATIVES

Derivatives of pyrazoles have played a key role and have been used as essential pharmacophores and synths in the field of organic chemistry and drug design. A series of 1-acetyl-3,5-diphenyl-4,5-dihydro-(1H)-pyrazoles were investigated for their ability to inhibit selectively
monoamine oxidases, swine kidney diamine oxidase and bovine serum amine oxidase. These compounds were reversible and non-competitive inhibitors of all types of the assayed amine oxidases. In particular 1-acetyl-3-(2,4-dihydroxyphenyl)-5-(3-methylphenyl)-4,5-dihydro-(1H)-pyrazole showed I50 values of 40nM accompanied by a selectivity factor of 4000 for MAOs (mitochondrial monoamine oxidases). By replacing the substituted phenyl ring at N1 by an acetyl group increased the inhibitory activity and selectivity towards MAOs of pyrazoles likely taking part in the interaction with the isoalloxazine nucleus.\textsuperscript{24}

Pyrazole derivatives synthesized were screened for antitubercular activity. The minimal inhibition concentration was used to evaluate the antituberculous activity.\textsuperscript{29}

4,5-Dihydro-N,3,5-triphenylpyrazole-1-carbothioamide

Abdel Hameed and co-workers reported 5-chloro-1-phenyl-3-methyl-pyrazolo-4 methinethiosemicarbazone as corrosion inhibitors for carbon steel in 1M HCl by chemical and electrochemical method. The corrosion rate decreased and inhibition efficiencies and surface coverage degree increased with increase in inhibitor concentration and temperature.\textsuperscript{30} The protective film of these compounds formed on the carbon steel surface is stable at higher temperatures. Nitulescu and co-workers (2010) synthesized N-(1-methyl-1H-pyrazole-4-carbonyl)-thiourea derivatives and evaluated for their analgesic and sedative effects. The compounds showed promising activities.\textsuperscript{31}

The synthesis and structure-activity relationship of pyrazole derivatives as anticancer agents that may function as inhibitors of EGFR and kinases was reported. Some of them exhibited significant EGFR inhibitory activity. 3-(3,4-Dimethylphenyl)-5-(4-methoxyphenyl)-4,5-dihydro-1H-pyrazolo-1-carbothioamide displayed the most potent EGFR inhibitory activity with IC\textsubscript{50} of 0.07 \textmu M, which was comparable to the positive control erlotinib. The compound also showed significant antiproliferative activity against MCF-7 with IC\textsubscript{50} of 0.08 \textmu M and potent inhibitory activity in tumor growth inhibition.\textsuperscript{32}

Anti-inflammatory Activity

Inflammation is a multi-stage process that in the critical step is supposed to be powered by acutely released arachidonic acid and its prostaglandin-like metabolites. Two cyclooxygenase (COX) isozymes are known to catalyze
the rate-limiting stage of prostaglandin synthesis, COX-I and COX-II. Nonsteroidal anti-inflammatory drugs (NSAIDs) alleviate pain by counteracting the cyclooxygenase (COX) enzyme. Some common example of NSAIDs is aspirin, ibuprofen, and naproxen.

A series of 1-(4-substituted-phenyl)-3-phenyl-1H-pyrazole-4-carbaldehydes were prepared and tested for their anti-inflammatory and analgesic activities. Among the prepared compound exhibited the maximum anti-inflammatory activity. A novel series of pyrazole derivatives were reported by Tewari et al (2014) and evaluated in vivo for their anti-inflammatory activity. Among the compounds N-(4-(2-(3-methyl-1-phenyl-1H-pyrazol-5-yl)oxy)benzylidene)-4-methylbenzenamine showed comparable anti-inflammatory activity. Brullo et al, (2012) reported and synthesized the anti-inflammatory evaluation of new 2,3-dihydro-imidazo[1,2-b]pyrazole derivatives in which compound N-(4-fluorophenyl)-2,3-dihydro-7-methyl-2-phenylimidazo[1,2-b]pyrazole-1-carboxamide showed an interesting dual activity inhibiting both Fmlp-Ome and IL8-induced chemotaxis with IC50 values of 3.8 and 1.2 Nm, respectively.

Freddy et al (2001) have synthesized the series of 1-(3-bromo-4-methoxybenzyl)-4-formyl-3-(substituted phenyl) pyrazole and reported anti-inflammatory activity in vivo. Sayed et al (2012) reported a series of new pyrazole derivatives characterized as N-(5-(4-chlorophenyl)-1-phenyl-3-(trifluoromethyl)-1H-pyrazol-4-yl)methylene)-3,5bis (trifluoromethyl) aniline which exhibited optimal anti-inflammatory activity as compared with reference drugs diclofenac sodium and celecoxib. Bandgar et al (2009) evaluated the series of novel 1-(2,4-dimethoxy-phenyl)-3-(1,3-diphenyl-1H-pyrazol-4-yl)-propenone by the Claisen-Schmidt condensation of 1-(2,4-dimethoxy-phenyl)-ethanone and substituted 1,3-diphenyl-1H-pyrazole-4-carbaldehyde. All the synthesized compounds were evaluated for anti-inflammatory activity.
Anti-cancer Activity

Different derivatives of pyrazole are generated by linking pyrimidine, carboxyhydrazide, as well as ferrocenyl molecule with pyrazole cap and all that are particularly effective against carcinoma of lung cells. Ohki et al (2002) synthesized the pyrimidinyl pyrazole derivatives 1-[3,5-difluorophenyl]-N-(E)-3-[1-pyrimidin-2-yl]-1H-pyrazol-4-yl)piperidin-4-amine as a new scaffold of an anti-tumor agent, which also showed antiproliferative activity against human lung cancer cell lines and inhibited tubulin polymerization.\(^\text{43}\) Wei et al (2006) reported a series of novel small molecules of compound ethyl1-[20-hydroxy-30-arboxypropyl]-3-aryl-1H-pyrazole-5-carboxylate derivatives which have its potency to suppress lungs cancer cell growth.\(^\text{44}\) Xia et al (2007) prepared a series of novel 1-arylmethyl-3-aryl-1H-pyrazole-5-carbohydrazide derivatives which had inhibitory effects on the growth of A549 cells and induced the cell apoptosis.\(^\text{45}\) Fan et al (2008) reported a series of novel 1-[3-(3,4-dimethylphenyl)1H-pyrazol-5-yl]-3-[4-chlorophenyl]-1H-pyrazole-5-carboxamide which is inhibiting the growth of A549 cells.\(^\text{46}\) Balbi et al (2011) prepared a novel pyrazole derivatives 5-methoxy-2-[1-(pyridine-2-yl)]-1H-pyrazol-5-yl]phenol and reported their antiproliferative activity in human ovarian adenocarcinoma A2780 cells, human lung carcinoma A549 cells, and murine P388 leukemia cells.\(^\text{47}\) Lv et al (2010) reported and synthesized two series of pyrazole derivatives4,5-dihydro-5-[4-methoxyphenyl]-1H-pyrazole-1-caboxamide which are designing for potential EGFR kinase inhibitors, as well as antiproliferative activity against MCF-7 with potent inhibitory activity in tumor growth inhibition, would be a potential anticancer activity.\(^\text{32}\) Bandgar et al (2010) developed a new series of 3,5-diaryl pyrazole derivatives 1-[3,5-dichlorophenyl]-4-[4,5-dihydro-1H-imidazol-2-yl]-1H-pyrazol-5-amine and evaluated for their anticancer activity.\(^\text{48}\) Li et al (2012) developed a series of 1H-pyrazole-4-carboxamide derivatives and reported their potential antiproliferation activity and Aurora-A kinase inhibitory activity. Among the compounds, N-[4-ethoxyphenyl]-1,3-diphenyl-1H-pyrazole-4-carboxamide possessed the most potent biological activity against HT116 and MCF-7 cell lines with IC\(50\) value of 0.39 and 0.46 \(\mu\)M, respectively.\(^\text{49}\)
Anti-tubercular Activity

Manetti et al (2006) developed new inhibitors of Mycobacterium tuberculosis. The compound \((1\text{-}\text{chlorophenyl})\)-5-hydroxy-3-methyl-1H-pyrazol-4-yl](phenyl)methanone was found to be the most active agent with a MIC value of 25 \(\mu\)M/mL.\(^{50}\) As a continuation of our previous work that turned toward the identification of antimycobacterial compounds with innovative structure, the compound \((1\text{-}(4\text{-}bromophenyl)\text{-}5\text{-}hydroxy-3\text{-}methyl-1H-pyrazol-4-yl](4\text{-}chlorophenyl)methanone of pyrazole derivatives were synthesized by Castagnolo et al (2008) and assayed as inhibitors of M. tuberculosis H37Rv. The pyrazole derivatives with the p-bromophenyl group at the N1 position was showed to be very active.\(^{51}\) A new series of fluorinated pyrazoles were reported and screened by Shelki et al (2012) for their \textit{in vitro} anti-tubercular activities against Mycobacterium tuberculosis H37Rv. Results the compound \((5\text{-}(4\text{-}chlorophenyl)\text{-}4\text{-}5\text{-}dihydro-1H-pyrazol-3-yl)\text{-}3\text{-}(4\text{-}fluorophenyl)\text{-}1\text{-}phenyl-1H-pyrazole showed that pyrazoline displayed significant anti-tubercular activities against the M. tuberculosis H37Rv strain (MIC=6.25 \(\mu\)g/mL).\(^{52}\)

Anti-diabetic Activity

Cottineau et al (2002) were reported and developed a new series of substituted pyrazole-4-carboxylic acids for their antidiabetic activity. The results indicated that the prepared compound 3-methoxy-1H-pyrazole-4-carboxylic acid emerges as the best hypoglycemic agent in the series.\(^{56}\) Sharon et al (2005) were prepared a new series of 5-(5-arly-1H-pyrazol-3-yl) methyl-1H-tetraazoles and isolated them for their \textit{in vivo} anti-hyperglycemic activity. Out of screen compound demonstrated 24.6% of blood glucose-lowering activity at 100 mg/kg.\(^{57}\) Humphries et al (2009) were synthesized the series of novel 4-pyrazolyl-2-aminopyrimidines as inhibitors of c-Jun-N-terminal kinases. This study led to the identification of compound \((1s,4s)\text{-}4\text{-}(4\text{-}(3\text{-}(tetrahydro-2H-pyran-3-yl)-1H-pyrazol-4-yl)pyrimidin-2-ylamino)cyclohexanol which showed good selectivity across a panel of diverse protein and lipid.\(^{58}\) Briganca et al were reported several pyrazoloypyrimidines and evaluated as inhibitors of dipeptidyl peptidase-4(DPP4). Among the reported compound \((7\text{-}(2,4\text{-}dichlorophenyl}2\text{-}(2\text{-chlorophenyl})-3,3\text{-}dihydro-5\text{-}methylpyrazolo}[1,5\text{-}a]\text{pyrimidin-6-yl}methanamine displayed the greatest potency \((K_i=\ 20 \text{ Nm}) and demonstrated excellent selectivity over the other dipeptidyl peptidase.\(^{59}\)
(7-(2,4-dichlorophenyl)-2-(2-chlorophenyl)-3,3a-di hydro-5-methylpyrazolo[1,5-a]pyrimidin-6-yl)methanamine

Choi et al (2010) were synthesized the 1, 3-diphenyl-1H-pyrazole derivatives as a new series of potent PPAR partial agonists using an improved virtual screening method combining ligand-centric and receptor-centric methods. The pyrazole compound 4-formyl-2-methoxyphenyl-1,3-diphenyl-1H-pyrazole-4-carboxylate showed relatively strong binding activities against PPAR among the virtual candidates. Hernandez-Vazquez et al (2013) were reported the novel 1, 5-diaryl pyrazole derivatives and identify in vivo for their hypoglycemic activity. The compound 1-(3-chloro-4-fluorophenyl)-5-(4-fluorophenyl)-4-methyl-N-(piperidin-1-yl)-1H-pyrazole-3-carboxamide showed the most significant plasma glucose reduction with a decrease of 60%. Chaudhry et al (2017) were identified the new series of imidazolylpyrazoles and tested for their α-glucosidase inhibitory activity. The compound 3-(4-methoxyphenyl)-1-phenyl-4-(4,5-diphenyl-1H-imidazol-2-yl)-1H-pyrazole showed significant inhibitory potential and the in vitro enzyme inhibition indicate binding affinities as compared to that of reference acarbose. Hernandez-vazquez et al (2017) were reported the hybrid novel dual compound that exhibited both anti-diabetic and in vitro antioxidant effects. The compound (E)-N-(3-hydroxy-4-methoxybenzylidene)-1-(3,4-dichlorophenyl)-5-(4-chlorophenyl)-4-methyl-1H-pyrazole-3-carboxyamide showed a pronounced anti-hyperglycemic effect even at a dose of 5 mg/kg in a glucose tolerance test on normoglycemic rats.

Anti-leishmanial Activity

Bernardino et al (2006) were synthesized and reported the in vitro leishmanicidal activities of 1H-pyrazole-4-carboxamidazoles. Among all the 1H-pyrazole-4-carboxamidazoles derivatives examined the compound (Z)-N-(4-nitrobenzylidene)-1-(4-bromophenyl)-1-pyrazole-4-carboxyamide found the most active against L. amazonensis, L. chagasi and L. braziliensis species.

Dardari et al (2006) were reported the synthesis of new pyrazole derivatives, compound N-ethyl-2-methyl-1-(2-[1-phenyl-3-p-tolyl-1H-pyrazol-4-y]phenyl)propan-1-amine. This compound inhibited the in vitro multiplication of Leishmania tropica, Leishmania major and Leishmania infantum with IC_{50} value of 0.50 µg/mL, 0.65 µg/mL and 0.42 µg/mL, respectively. Dos santos et al (2011a) were reported the synthesis of new 1-Aryl-1H-pyrazole-4-carboximidamide derivatives and evaluated in vitro for their anti-leishmanial activities. Compound 1-(4-bromophenyl)-1H-pyrazole-4-carboxamide showed an activity profile that can be improved through medicinal chemistry strategies. Dos santos et al (2011b) were reported the new series of 1-aryl-4-(4,5-dihydro-1H-imidazol-2-yl)-1H-pyrazoles and evaluated in vitro against three Leishmania species: L. amazonensis, L. braziliensis and L. infantum. Among the examined compound 1-(4-bromophenyl)-4-(4,5-dihydro-1H-imidazol-2-yl)-1H-pyrazole emerged as the most active on promastigotes forms of L. amazonensis, with a IC_{50} value of 15 µM.
Beik et al. (2014) synthesized a novel series of 1H-pyrazole derivatives and tested for their in vitro anti-leishmanial activities against L. aethiopica promastigotes. The highest anti-leishmanial activity was exhibited by compound (E)-3-(3-phenyl-1-p-tolyl-1H-pyrazol-4-yl)-1-(thiophen-2-yl)prop-2-en-1-one with an IC₅₀ of 0.08 μg/mL. Figarella et al. (2020) reported and tested pyrazole derivatives for their in vitro antiparasitic activity against promastigotes of Leishmania maxicana and epimastigotes of Trypanosoma cruzi using a modified MTT assay. Only compound (2-hydroxy-5-methylphenyl)(1-phenyl-1H-pyrazol-4-yl)methanone displayed selectivity on L. mexicana with an SI of 3. However, the IC₅₀ obtained here was around four times higher. Tuha et al. were developed a new series of pyrazole derivatives and tested in vitro for their anti-leishmanial activity. Compound 1-(4,5-dihydro-3-phenyl-5-(1-phenyl-3-p-tolyl-1H-pyrazol-4-yl)pyrazol-1-yl)ethanone was found to be the most active than the standard mulfetroside and amphotericin B deoxocholate for Leishmania donovani. Reviriego et al. (2017) reported the synthesis of some simple dialkyl pyrazole-3,5-dicarboxylates against Trypanosoma cruzi, Leishmania infantum and Leishmania braziliensis. The compound diethyl-1H-pyrazole-3,5-dicarboxylate showed high efficiency against the mentioned protozoa.

Diethyl 1H-pyrazole-3,5-dicarboxylate

Anti-viral Activity

Genin et al. (2000) synthesized a novel 1,5-diphenylpyrazole class of HIV-1 nonnucleoside reverse transcriptase inhibitors. Compound 2-(3-methyl-1,5-diphenyl-1H-pyrazol-4-yl)acetominitrile was found to have good activity verse wild-type and delavirdine-resistant P236L reverse transcriptase. Rostom et al. (2003) reported a new series of 1-(4-chlorophenyl)-4-hydroxy-1H-pyrazole-3-carboxylic acid hydrazide analogs and were tested for their in vitro effect on the replication of hepatitis-C virus (HCV) in HepG2 hepatocellular carcinoma cell line infected with the virus using the reverse transcriptase-polymerase chain reaction technique. The results revealed that compound 1-(4-chlorophenyl)-N-formyl-4-hydroxy-1H-pyrazole-3-carboxyhydrazide were capable of inhibiting the replication of both the HCV RNA(+)(+) and (-) stands at 10-100 μg/mL concentration range. Sun et al. (2007) were synthesized a novel series of methyl-3-(trifluoromethyl)-N-[4-(pyrrolidinylsulfonyl)phenyl]-1H-pyrazole-5-carboxamide and potent inhibitor against multiple primary isolates of diverse measles virus (MV) genotype currently circulating worldwide. The most active piperidine derivatives, when subjected to a secondary virus titer reduction assay, revealed activity against live MV (0.012-0.017 μM, strain Alaska) and no cytotoxicity.

Zeng et al. (2008) have been reported novel phenyl-substituted 1H-pyrazole-3-carboxylic acids and were conveniently examined concerning the effect on the IN inhibition and HIV replication. The most antiviral effect was exhibited by 5-(4-nitrophenyl)-1H-pyrazole-3-carboxylic acid and 3-(3-(benzyloxy)phenyl)isoxazole-5-carboxylic acids 46 with an EC₅₀ value of 3.7 and 254 μM. Mowbray et al. (2009a) synthesized a series of N-hydroxyethyl pyrazole derivatives and evaluated in vivo for their anti-HIV activity. The compound methyl-5-(4-nitrophenyl)-1H-pyrazole-3-carboxylate demonstrated excellent activities against large panels of wild type and drug-resistant HIV consistent with the encouraging profile demonstrated against the design isolated RT enzymes shown above. Mowbray et al. (2009b) described the design and synthesis of a novel series of non-nucleoside HIV reverse transcriptase inhibitors (NNRTI) based on a pyrazole template. The compound 4-(3,5-dimethylphenoxo)-3,5-diethyl-1-propyl-1Hpyrazole and 2-(4-(3,5-dichlorophenyl)-3,5-diethyl-1H-pyrazol-1-yl)ethanol are active against wild type reverse transcriptase (RT) and retain activity against clinically important mutants. Combining the best 3- and 5-substituted gave the 3,5-diethyl pyrazole as the most potent compound in this early series.
Tentawy et al (2012) were prepared the new series of 4-substituted 3-methyl-1,5-diphenyl-1H-pyrazole and isolated in vitro for antiviral activity against herpes simplex virus type-1 grow on Vero African green monkey kidney cells through plaque-reduction assay method using acyclovir as a positive control. The result of the antiviral activity of the prepared compound 4-(4,5-dihydro-4-methylisoxazol-5-yl)-3-methyl-1,5-diphenyl-1H-pyrazole showed that exhibited strong antiviral activity with IC_{50} value of 0.03 compared to the used reference drug. Fioravanti et al (2015) were reported the series of N-[[1,3-diphenyl-1H-pyrazol-4-yl]methyl]anilines and evaluated in vitro for cytotoxicity and antiviral activity against a large panel of viruses. Most of the tested compound 1-phenyl-N,3-dip-tolyl-1H-pyrazol-4-amine interfered with RSV replication in the micromolar concentration.

Anti-Parkinson Activity

Chimenti et al (2010) were described a new series of N1-thiocarbamoyl-3,5-di(hetero)aryl-4,5-dihydro-(1H)-pyrazole derivatives and evaluated for their ability to inhibit the activity of the A and B isoforms of human monoamine oxidase. Compound 5-(4-fluorophenyl)-3-(furan-2-yl)-4,5-dihydropyrazole-1-carboxothioamide was found the most active of the series with IC_{50} value of 2.78 µM and selectivity ratio of 26. Chan et al (2012) were synthesized a new aminopyrazole as a Leucine-Rich Repeat Kinase 2 (LRRK2) inhibitors. In in vivo rodent PKPD studies, compound 1-(3-(5-(trifluoromethyl)-4-(methylamino)pyrimidin-2-ylamino)-5-chloro-1H-pyrazol-1-yl)-2-methylpropan-2-ol demonstrated good brain exposure and engendered significant reduction in brain pLRRK2 levels post-ip administration. Estrada et al (2014) were identified as a new aminopyrazoles as Leucine-Rich Repeat Kinase 2 inhibitors. Compound 2-(4-(3-aminio-4-

(trifluoromethyl)phenylamino)-3-methyl-1H-pyrazol-1-yl)-2-methylpropanenitrile was identified as a highly potent and selective LRRK2 inhibitors with IC_{50} value of 3 nM.

Several new pyrazole derivatives containing a quinolone moiety were synthesized and tested for their anti-inflammatory and ulcerogenic effect. Hussain et al (2015) synthesized pyrazole derivatives and investigated them for their, anti-inflammatory and analgesic activity. Results indicated that (E)-4-(((3-chloro-4-fluorophenyl)imino)methyl)-3,5-dimethyl-1H-pyrazole-1-carboxothioamide showed anti-inflammatory activities.

The anti-cholinesterase activity of the target compound was assessed in vitro against AChE from Electrophorus electrics and horse serum butryrycholinesterase in comparison to tacrine as the reference drug.

Antimicrobial Activity

Bondock et al (2008) reported the synthesis and antimicrobial activity of some new heterocycles incorporating antipyrene moiety. 2-cyano-N-(1,5-dimethyl-3-oxo-2-phenyl-2,3-dihydro-1H-pyrazol-4-yl) acetamide was utilized as a key intermediate for the synthesis of some new coumarin, pyridine, pyrrole, thiazole, pyrido, pyrazolo triazine and amino pyrazole.
Analgesic Activity

Rajasekaran et al (2012) novel [1-(3-(5-chloro-2-hydroxy phenyl)-5-aryl-4,5-dihydro pyrazol-1-yl] ethanone derivatives has been synthesized and were screened for analgesic activity by acetic acid-induced writhing inhibition method. Results showed that all the synthesized compounds shown significant activity when compared with that of standard drug.  

Anti-TMV Activity

The commercially available plant virucide Ningnammycin was used as a positive control. The anti-viral bioassay against TMV is assayed by the reported method and the anti-viral results of all the compounds. the results showed that most of the targets compound present excellent anti-TMV activities at 500mg/L.  

ACE Inhibitors

Bonesi et al (2010) produced a series of pyrazole derivatives and examined their potential activity as Angiotensin-I-converting enzyme inhibitory (ACE inhibitors) activity by performance evaluation.  

Antiamoebic Activity

Abid et al 2005, reported the synthesis of a series of new 1-N-substituted cyclized pyrazoline analogous to thiosemicarbazole and were evaluated for their antiamoebic activity.  

Neuroprotective Activity

Cocconcelli et al (2008), have described the parallel synthesis of aryl azoles. Here substituted phenylhydrazine is made to react with an α, β-unsaturated ketones, which leads to the regioselective formation of 4,5-dihydro-1H-pyrazole and acetic acid was used as a catalyst. Compounds possess good neuroprotective activity.  

CONCLUSION

The research and other informational data, available in literature so far, have rendered pyrazole a significantly important class of heterocyclic compounds and their applications in ever-challenging chemotherapy of various ailments/ infections since the last three decades immensely hiked interests of medicinal chemist and biochemist. It has been seen that pyrazole derivatives incorporated with different nuclei have shown a variety of pharmacological profile. Pyrazole compound can be used with various heterocyclic systems with enhancing biological activity. This particular review article, established the fact that pyrazole derivatives could be a rich source of potential entities in the research of a new generation of biologically active compounds. Thus, the quest to explore many more modifications to pyrazole moiety needs to be continued.
