(Received: March 8, 2012; Accepted: March 19, 2012)

SUMMARY: We present two new catalogues of radio-continuum sources in the field of the Small Magellanic Cloud (SMC). These catalogues contain sources found at 4800 MHz (λ=6 cm) and 8640 MHz (λ=3 cm). Some 457 sources have been detected at 3 cm with 601 sources at 6 cm created from new high-sensitivity and resolution radio-continuum images of the SMC from Crawford et al. (2011).

Key words. Magellanic Clouds – radio continuum : galaxies – catalogs

1. INTRODUCTION

The Small Magellanic Cloud (SMC), well known for its close proximity (≈60 kpc; Hilditch et al. 2005) and ideal location in one of the coldest areas of the radio sky (also towards the South Celestial Pole), allows observations of radio emission to be made without interference from the Galactic foreground radiation (Haynes et al. 1986). Therefore, the SMC is an ideal location to study radio sources like supernova remnants (SNRs; Filipović et al. 2005, 2008, Payne et al. 2004, Filipović et al. 2009b, Mao et al. 2008, Dickel et al. 2010), and single dish observations from the 64-m Parkes radio-telescope (Filipović et al. 1997, 1998).

Catalogues of radio-continuum point sources covering the region of the SMC have been created from these surveys, and from wider surveys of the southern sky (see the summary of these catalogues in Wong et al. 2011a,b).

We recently published a set of new high-resolution radio-continuum maps of the SMC at 6 and 3-cm, created by combining observations from ATCA (Crawford et al. 2011, hereafter Paper I). We now present a catalogue of radio-continuum sources in the region of the SMC derived from our 6 and 3 cm radio-continuum maps (Fig. 1 and Fig. 3 in Paper I).

In Section 2 we describe the data used to derive the radio-continuum point sources. In Section 3 we describe our source fitting and detection methods. Section 4 contains our conclusions and the appendix contains the radio-continuum source catalogue.
2. DATA

The 6 and 3 cm maps (Fig. 1 and Fig. 3 in Paper I) were created by combining data from various ATCA projects that covered the SMC (Table 1 in Paper I). The majority of the data used come from ATCA project C1207 (Dickel et al. 2010). The 3 and 6 cm maps have a resolution of 20" and 30", and sensitivity of 0.8 and 0.7 mJy/beam, respectively.

Table 1 contains the field size of all the images used to derive the radio-continuum sources contained in this paper (Tables A1 and A2).

| Image  | RA1  | RA2  | Dec1 | Dec2 |
|--------|------|------|------|------|
| 3 cm   | 00h 26m | 01h 27m | -70°35' | -75°21' |
| 6 cm   | 00h 26m | 01h 28m | -70°29' | -75°29' |
| 13 cm  | 00h 27m | 01h 35m | -70°30' | -75°15' |
| 20 cm  | 00h 10m | 01h 43m | -69°16' | -75°40' |
| 36 cm  | 00h 16m | 01h 40m | -72°30' | -74°38' |

3. SOURCE FITTING AND DETECTION

The miriad task imsd (Sault et al. 1995) was used to detect sources in the 3 cm and 6 cm images, requiring a fitted Gaussian flux density >5σ (3.5 mJy). All sources were then visually examined to confirm that they are genuine point sources, excluding extended emission, bright side lobes, etc.

The catalogue of radio-continuum sources contains positions RA(J2000), Dec(J2000) and integrated flux densities at 3 cm (Table A1) and 6 cm (Table A2). Table 2 provides a summary of the images and resulting catalogues of radio-continuum sources used in this study. In addition, the 13, 20 and 36 cm information from Wong et al. (2011a,b) is repeated for comparison. Table 2 also contains the number of sources identified within the field of the 13 cm image (see Table 1), the smallest of all the survey regions compared.

| λ  | RMS (mJy/beam) | Number Within the Beam Size (cm) | Field Size (arcsec) | Sources |
|----|---------------|---------------------------------|--------------------|--------|
| 3  | 0.8           | 457                             | 457                | 20     |
| 6  | 0.7           | 601                             | 601                | 30     |
| 13 | 0.4           | 743*                            | 743*               | 45     |
| 20 | 0.7           | 1560                            | 824                | 14.8 x 12.2 |
| 36 | 0.7           | 1689                            | 1198               | 40     |

The catalogue of radio-continuum sources contains positions RA(J2000), Dec(J2000) and integrated flux densities at 3 cm (Table A1) and 6 cm (Table A2). Table 2 provides a summary of the images and resulting catalogues of radio-continuum sources used in this study.

4. CONCLUSION

We present a new catalogue of radio-continuum sources towards the SMC, containing sources found at 3 cm and 6 cm.

The 3 cm and 6 cm catalogue, containing 457 and 601 sources respectively, has been created from new high-sensitivity and resolution radio-continuum maps of the SMC from Paper I.
