Abstract

Two new species of oribatid mites of the genus *Macrogena* (Oribatida, Ceratozetidae) are described from alpine soils of the South Island of New Zealand. *Macrogena brevisensilla* sp. n. and *M. abbreviata* sp. n. differ from all species of this genus by the tridactylous legs and by the comparatively short interlamellar setae, respectively. New generic diagnosis and an identification key to the known species of *Macrogena* are provided.

Keywords

Oribatid mites, *Macrogena*, new species, generic diagnosis, key, New Zealand

Introduction

*Macrogena* is an oribatid mite genus of the family Ceratozetidae (Acari, Oribatida) which was proposed by Wallwork (1966) with *Macrogena monodactyla* Wallwork, 1966 as type species. At present, three species are known¹: *M. crassa* Hammer, 1967, *Mycobates minor* Subías, Kahwash & Ruiz, 1990 from the Mediterranean, *Lophozetes truncatus* Balogh, 1985 from Australia and *Safrobates miniporus* Mahunka, 1989 from Tasmania. However, *M. minor* has rostral setae inserted laterally on prodorsum, dorsosphragmata separated medially and six pairs of genital setae; *L. truncatus* and *S. miniporus* have lamellar cusps fused medially. Hence, the morphological characters of these species do not correspond absolutely to the generic diagnosis of *Macrogena*, therefore their systematic position need further investigations.
M. rudentiger Hammer, 1967 (both from New Zealand) and M. monodactyla Wallwork, 1966 (from the Antarctic region).

During the recent study of oribatid mite fauna of the high alpine zone of several mountain ranges in New Zealand (Central Otago, South Island), we discovered two new species of the genus Macrogena; both species were common and abundant in the collected material. Additionally, we propose a new generic diagnosis for Macrogena, and provide an identification key for all known species of this genus.

Materials and methods

The collection locality and habitat for each new species are given in the respective “Material examined” sections.

Specimens were mounted in lactic acid on temporary cavity slides for measurement and illustration. The body length was measured in lateral view, from the tip of the rostrum to the posterior edge of the ventral plate. Notogastral width refers to the maximum width in dorsal aspect. Lengths of body setae were measured in lateral aspect. All body measurements are presented in micrometers. Formulas for leg setation are given in parentheses according to the sequence trochanter–femur–genu–tibia–tarsus (famulus included). Formulas for leg solenidia are given in square brackets according to the sequence genu–tibia–tarsus. General terminology used in this paper follows that of Grandjean (summarized by Norton and Behan-Pelletier 2009). Drawings were made with a drawing tube using a Carl Zeiss transmission light microscope “Axioskop-2 Plus”. Images were obtained with an AxioCam ICc3 camera using a Carl Zeiss transmission light microscope “Axio Lab.A1”.

Taxonomy

Genus Macrogena Wallwork, 1966

Type species. Macrogena monodactyla Wallwork, 1966

Diagnosis (partially based on data from Wallwork 1966; Hammer 1967). Ceratozetidae with rostrum with medial rectangular ledge formed by two lateral incisions; rostral setae inserted dorsally or dorso-laterally on prodorsum; lamellar and interlamellar setae strong, straight; bothridial setae fusiform or globular; lamellae large, with short cusps, connected by translamella; tutoria and genital teeth long, reach the level of insertions of rostral setae; dorsophragmata fused medially; notogaster with three or four pairs of porose areas; ten pairs of short and thin notogastral setae; five pairs of genital, one pair of aggenital, two pair of anal, and three pairs of adanal setae; legs mono- or tridactylous.
Macrogena brevisensilla sp. n.
http://zoobank.org/7D7732BB-EF8C-47F5-8A14-23903114CE77
Figs 1–22

Diagnosis. Body size: 315–332 × 182–199. Lamellar cusps without teeth. Translamella broad. Rostral setae dilated in medio-distal parts, ciliated. Lamellar and interlamellar setae long, thickened, densely barbed. Bothridial setae globular. Tutoria broadly triangular. Four pairs of notogastral porose areas present. Notogastral setae short, thin. Epimeral setae 1c thickened, barbed. Tridactylyous.

Description. Measurements. Body length: 332 (holotype: female), 315–332 (six paratypes: three females, three males); notogaster width: 182 (holotype), 182–199 (six paratypes).

Integument. Body color light brown to brown. Body surface punctate (visible under high magnification). Lamellae, epimeral region, pedotecta I and subcapitular meni tum with striae.

Prodorsum. Anterior edge of medial ledge of rostrum slightly wavy, lateral incisions very narrow. Lamellae shorter than half of prodorsum. Lamellar cusps without teeth. Translamella straight, broad. Rostral setae (ro, 32–41) dilated in medio-distal parts, ciliated. Lamellar (le, 49–57) and interlamellar (in, 82–90) setae thickened, densely barbed. Lamellar setae sometimes slightly dilated medio-distally. Bothridial setae (ss, 22–26) globular, with short stalk (4–6) and longer, indistinctly barbed head (18–20). Tutoria (tu) broadly triangular distally. Exobothridial setae (ex, 4) thin, smooth.

Notogaster. Anterior margin convex medially. Pteromorphs broadly rounded laterally. Porose areas Am elongate oval. Dorsophragmata (D) of medium size. Four pairs of porose areas present, all rounded: Aa (8), A1, A2 and A3 (6). Notogastral setae thin, smooth, c(12) little longer than other nine pairs (6–8). Lyrifissures ia, im, ip, ih and ips distinct. Opisthontal gland openings (gla) located posteriorly to im.

Gnathosoma. Subcapitulum longer than wide (86 × 61–65). Subcapitular setae h (4–6) thin, smooth; a (12–16) and m (18–20) setiform, slightly barbed. Adoral setae (or1, or2, 8–10) simple, densely barbed. Palps (53–61) with setation 0–2–1–3–9(+ω). Solenidion attached to eupathidium, both located on dorsal tubercle. Chelicerae (90–94) with two simple, barbed setae; cha (28–32) longer than chb (16–20). Trägårdh’s organ (Tg) long, tapered.

Epimeral and lateral podosomal regions. Pedotecta I (Pd I) large, concave in dorsal view. Pedotecta II (Pd II) of medium size, triangular, rounded distally in ventral view. All pedotecta scale-like in lateral view. Genal teeth (gt) elongate narrowly triangular. Apodemes 1, 2, sejugal and 3 distinctly developed. Epimeral setal formula 3–1–2–2. Epimeral setae 1c (10) thickened, barbed; other setae (4–6) thin, smooth. Custodia (cus) with long, pointed tips. Discidia (dis) triangular. Circumpedal carinae (cp) distinct.

Anogenital region. Genital (g, g1, 4–6), aggenital (ag, 4–6), anal (an1, an2, 4–6) and adanal (ad1–ad3, 6–8) setae thin, smooth. Lyrifissuresiad located close to anal aperture, in paraanal position. Ovipositor elongated (102–110 × 28), blades (45–49) shorter.
Figures 1–4. *Macrogena brevisensilla* sp. n., adult: 1 dorsal view 2 ventral view (legs not shown) 3 lateral view of anterior part of body (leg I not shown) 4 lateral view of posterior part of body. Scale bars 100 µm (1, 2), 50 µm (3, 4).

than length of distal section (beyond middle fold; 57–61). Each of three blades with four straight, smooth setae, $\psi_1 \approx \tau_1$ (32) longer than $\psi_2 \approx \tau_1 \approx \tau_2 \approx \psi_3$ (14–16). Six coronal simple setae ($k$, 8) present.
The oribatid mite genus *Macrogena* (*Acari, Oribatida, Ceratozetidae)*...

**Figures 5–9.** *Macrogena brevisensilla* sp. n., adult: 5 frontal view of prodorsum 6 posterior view 7 sub-capitulum, ventral view 8 palp 9 chelicera. Scale bars 50 µm (5, 6), 20 µm (7–9).

**Legs.** Tridactylous. Medial claw thicker than two laterals; all indistinctly serrate dorsally. Genua I and II, and femora II with antero-ventral tooth (t). Formulae of leg setation and solenidia: I (1–5–3–3–18) [1–2–2], II (1–5–3–4–15) [1–1–2], III (2–2–1–3–15) [1–1–0], IV (1–2–2–3–12) [0–1–0]; homology of setae and solenidia as indicated in Table 1. Famulus (ε) short, blunted. Setae l” on tibiae and genua I, II thick.

**Material examined.** Holotype (female) and six paratypes (three females and three males): New Zealand, South Island, Central Otago, The Remarkables, 45°3’38”S, 168°48’43”E, 1867 m a.s.l., in the soil and debris under *Raoulia* sp. cushion, 19 February 2014, collected by M. Minor.

**Type deposition.** The holotype and two paratypes are deposited in the New Zealand National Arthropod Collection, Auckland, New Zealand; two paratypes are deposited in the collection of the Senckenberg Institution, Frankfurt, Germany; two paratypes are deposited in the collection of the Tyumen State University Museum of Zoology, Tyumen, Russia.

**Etymology.** The specific name *brevisensilla* refers to the short bothridial setae (sensilla).
Figures 10–13. Macrogena brevisensilla sp. n., adult: 10 leg I, right, antiaxial view 11 tibia, genu, femur and trochanter of leg II, right, antiaxial view 12 genu, femur and trochanter of leg III, right, antiaxial view 13 leg IV, left, antiaxial view. Scale bar 20 µm.

Table 1. Leg setation and solenidia of adult Macrogena brevisensilla sp. n.

| Leg | Trochanter         | Femur      | Genu        | Tibia                | Tarsus                |
|-----|--------------------|------------|-------------|----------------------|-----------------------|
| I   | v'                 | d, (l), bν'', ν'' | (l), v', σ  | (l), v', φ', φ''     | (f), (ν), (it), (p), (a), s, (νν), (p), ε, ω, ω' |
| II  | v'                 | d, (l), bν'', ν'' | (l), v', σ  | (l), (ν), φ         | (f), (ν), (it), (p), (a), s, (νν), ω, ω' |
| III | l', v'             | d, eν'     | l', σ       | l', (ν), φ          | (f), (ν), (it), (p), (a), s, (νν) |
| IV  | v'                 | d, eν'     | d, l'       | l', (ν), φ          | f'', (ν), (p), (a), s, (νν) |

Note: Roman letters refer to normal setae, Greek letters to solenidia (except for ε = famulus). Single prime (‘) marks setae on the anterior and double prime (‘‘) setae on the posterior side of a given leg segment. Parentheses refer to a pair of setae.

Scale bar 20 µm.
Remarks. *Macrogena brevisensilla* sp. n. differs from all species of this genus by the tridactylous legs.

Wallwork (1966) considered monodactylous legs as the generic character of *Macrogena*. The new species has tridactylous legs, however, all other morphological traits correspond to the other species of this genus. Thus, we included *M. brevisensilla* sp. n. in *Macrogena*, and included alternatively tridactylous legs in the revised generic diagnosis.

*Macrogena abbreviata* sp. n.
http://zoobank.org/2F9CD29C-B10C-42A2-B3F5-5C13EF4954BC
Figs 23–44

**Diagnosis.** Body size: 254–291 × 143–151. Lamellar cusps without teeth. Translamella of medium thickness. Rostral setae setiform, ciliated. Lamellar and interlamellar setae of medium size, thickened, barbed. Bothridial setae fusiform. Three pairs of notogastral porose areas present. Notogastral setae short, thin. Monodactylous.

**Description.**

- **Measurements.** Body length: 270 (holotype: female), 254–291 (six paratypes: three females, three males); notogaster width: 143 (holotype), 143–151 (six paratypes).

- **Integument.** Body color light brown to brown. Body surface punctate (visible under high magnification). Lamellae and pedotecta I striate; epimeral region also with longitudinal striae, however it is visible only in dissected specimens.

- **Prodorsum.** Medial ledge of rostrum truncated, lateral incisions well visible. Lamellae shorter than half of prodorsum. Lamellar cusps without teeth. Translamella straight, thickened. Rostral setae (24–28) setiform, ciliated. Lamellar (18–20) and interlamellar (32–36) setae thickened, usually indistinctly barbed (rarely with sparse, strong barbs). Bothridial setae (22–26) fusiform, with short stalk (6) and longer, indistinctly barbed head (16–20). Tutoria narrowly triangular distally, slightly rounded, sometimes pointed. Exobothridial setae (4) thin, smooth.

- **Notogaster.** Anterior margin convex medially. Pteromorphs broadly rounded laterally. Porose areas Am elongate oval. Dorsophragmata of medium size. Three pairs of porose areas present, all rounded: Aa (6–8), A2 and A3 (4–6). Notogastral setae (12–14) thin, smooth. Lyrifissures distinct. Opisthontotal gland openings located posteriorly to im.

- **Gnathosoma.** Subcapitulum longer than wide (65–69 × 45–53). Subcapitular setae thin, slightly barbed; m (18–20) longer than a (12–16) and b (8–10). Adoral setae (8) simple, densely barbed. Palps (45) with setation 0–2–1–3–9(ω). Solenidion attached to eupathidium, both located on dorsal tubercle. Chelicerae (73–77) with two simple, barbed setae; cha (28) longer than chb (14–16). Trägårdh’s organ long, tapered.

- **Epimeral and lateral podosomal regions.** Pedotecta I large, concave in dorsal view. Pedotecta II of medium size, triangular, rounded distally in ventral view. All pedotecta scale-like in lateral view. Genal teeth elongate narrowly triangular. Apodemes 1, 2, sejugal and
The oribatid mite genus Macrogena (Acari, Oribatida, Ceratozetidae)...

...3 distinctly developed. Epimeral setal formula 3–1–2–2. Epimeral setae (8) thin, smooth. Custodia with long, pointed tips. Discidia triangular. Circumpedal carinae distinct.

**Anogenital region.** Genital (8–12), aggenital (8–12), anal (8–12) and adanal (12–14) setae thin, smooth. Lyrifissures iad located close to anal aperture, in inverse apoa-
