September 2021
Construct open system response functions using Resonant States (QNMs)

Maxwell electromagnetic equation:

\[
|\Psi\rangle = \left( \mathbb{L} - \omega \Gamma_\omega \right) |\Psi\rangle = -i |J\rangle
\]

\[
|\Psi\rangle = \begin{pmatrix} \mathbf{E}(\mathbf{r}, \omega) \\ \mathbf{H}(\mathbf{r}, \omega) \end{pmatrix}, \quad \mathbb{L} = ic \begin{pmatrix} 0 & \nabla \times \\ \nabla \times & 0 \end{pmatrix}, \quad \Gamma_\omega \equiv \begin{pmatrix} \varepsilon(\mathbf{r}, \omega) & 0 \\ 0 & -\mu(\mathbf{r}, \omega) \end{pmatrix}
\]

Response function: \( \mathcal{G} \)

\[
|\Psi\rangle = -i (\mathbb{L} - \omega \Gamma_\omega)^{-1} |J\rangle \equiv -\mathcal{G} |J\rangle
\]

Resonant States: \( |\Psi_\alpha\rangle \)

\[
\mathbb{L} |\Psi_\alpha\rangle = \omega_\alpha \Gamma_\alpha |\Psi_\alpha\rangle
\]

\[
\omega_\alpha = \omega'_\alpha + i \omega''_\alpha
\]

\[
\alpha = -\infty, ..., -1, 0, 1, 2, ..., \infty
\]
Construct the response operator $\mathcal{G}$ (Green’s “function”)

$$\mathcal{G} = (\mathbb{L} - \omega \Gamma_\omega)^{-1} \quad \rightarrow \quad \mathcal{G}_i = i \sum_{\alpha = -L_{\text{max}}}^{L_{\text{max}}} \frac{1}{\omega - \omega_\alpha} \langle \Psi_\alpha | \left[ \frac{d}{d\omega} \omega \Gamma_\omega \right]_{\omega_\alpha} | \Psi_\alpha \rangle + \mathcal{G}_{\text{n.r.}}$$

$L_{\text{max}} = \infty$

Three important problems must be resolved:

1) Render $\langle \Psi_\alpha | \left[ \frac{d}{d\omega} \omega \Gamma_\omega \right]_{\omega_\alpha} | \Psi_\alpha \rangle$ well defined (normalization)

2) Determine the non-resonant contribution $\mathcal{G}_{\text{n.r.}}$?

3) Truncate the RS expansion ($L_{\text{max}}$ finite) in a meaningful manner
Why are Resonant States scalar products, $\langle \Psi_\alpha | \hat{\Gamma} | \Psi_\beta \rangle$, problematic?

Gamow theory $\alpha$-decay

Complex energy: $E_q = E'_q + i E''_q$

“... for the running wave the amplitude in the direction of the diverging wave will increase. This means nothing more than that if the vibrations are damped at the source of the wave, the amplitude of the wave segment that left earlier must be larger.”

Dielectrics light scattererering

“Whispering gallery” resonances

$\omega_\alpha = \omega'_\alpha + i \omega''_\alpha$
Gaussian regularization for RS scalar products:

\[ \langle \Psi_\ell | \hat{\Gamma} | \Psi_\ell \rangle = \lim_{\eta \to 0} \int e^{-\eta r^2} (\epsilon E_\ell^2 - H_\ell^2) dr = \omega_\ell \frac{R}{c} \]

\[ \frac{\text{Im}(\omega R/c), \sigma_1^{(e)}}{\pi R^2} \]

\[ \epsilon_s = 16 \]

Cross section

RS eigenvalues

\[ \langle \Psi_2 | \hat{\Gamma} | \Psi_2 \rangle = 1.05 - i0.072 \]

\[ \langle \Psi_1 | \hat{\Gamma} | \Psi_1 \rangle = 1.035 - i0.5 \]
Dispersion materials are particularly challenging
But we can formulate response functions!

$$\varepsilon(\omega) = \varepsilon_\infty - \frac{\omega_p^2}{\omega^2 + i\omega \Gamma_D}$$

$$\sigma(\omega) = \frac{\sigma_0}{\pi R^2}$$
Conclusion: RS Spectral expansions work!

But handle with care! (non-resonant states, corrected normalizations, …)

Lorenz(1890)-Mie(1908) theory

“Exact” response functions of a spherical scatterer

\[
\begin{align*}
\mathbf{f}_p^{(e)} &= -a_n e_p^{(e)} = t_n^{(e)} e_p^{(e)} \\
\mathbf{f}_p^{(h)} &= -b_n e_p^{(h)} = t_n^{(h)} e_p^{(h)}
\end{align*}
\]

T-matrix coefficients

Lorenz-Mie coefficients

\[
\begin{align*}
a_n &= \frac{\varepsilon_s j_n(k_sR)\psi'_n(kR) - \psi'_n(k_sR)j_n(kR)}{\varepsilon_b j_n(k_sR)\xi'_n(kR) - \psi'_n(k_sR)h_n(kR)} \\
b_n &= \frac{\mu_s j_n(k_sR)\psi'_n(kR) - \psi'_n(k_sR)j_n(kR)}{\mu_b j_n(k_sR)\xi'_n(kR) - \psi'_n(k_sR)h_n(kR)}
\end{align*}
\]

Ludvig Lorenz (1829–91) “Light scattering and reflection by a transparent sphere (surface)” in Oeuvres scientifiques de L. Lorenz. 1898, p 403-529 (1890).
Explain physical phenomena using RS (QNMs) with well-defined normalizations

\[ \sigma_1^{(e)} = \frac{6\pi}{k^2} |a_1|^2 \quad a_1 = -T_{1,1} \]

\[ \varepsilon = 16 \]

\[ a_1 = \frac{\varepsilon_s}{\varepsilon_b} \frac{j_1(k_sR)\psi'_1(kR) - \psi'_1(k_sR)j_1(kR)}{\varepsilon_s \frac{j_1(k_sR)\zeta'_1(kR) - \psi'_1(k_sR)h_1(kR)}} \]

\[ T_{n,q}(\omega) = \frac{(-1)^n q e^{-2iR\omega/c}}{2} - 1 + \frac{ce^{-2iz}}{R} \sum_{\ell=-\infty}^{\infty} \frac{r_{\alpha}}{\omega - \omega_{\alpha}} \]

Egocentric physics: Just about Mie,
Stout et al, EPL 119(4), 44002(7), (2017).

Non-resonant term!
Resonant state spectral expansion

\[ r_{\alpha} = \frac{ie^{2iR\omega_{\alpha}/c}}{N_{\alpha}^2} \]
The problem of spectral RS expansion convergence (case of a gold sphere)

\[ T_{n,q}(\omega) = \frac{(-1)^{n+q} e^{-2iR\omega/c} - 1}{2} + \frac{ce^{-2iz}}{R} \sum_{\ell=-L_{\text{max}}}^{L_{\text{max}}} \frac{r_\alpha}{\omega - \omega_\alpha} \]

Drude model

\[ \varepsilon(\omega) = \varepsilon_\infty - \frac{\omega_p^2}{\omega^2 + i\omega \Gamma_D} \]

Direct cutoff for a Drude model sphere is disastrous

\[ L_{\text{max}} = 1 \quad \text{and} \quad L_{\text{max}} = 4 \]

\[ R = 80\text{nm} \]

\[ \lambda_\alpha = \frac{2\pi c}{\omega_\alpha} \]
Solving the spectral convergence problem

\[ \tilde{r}_\alpha(q,n,\ell) = \frac{R}{2c_b} \frac{\prod_{\ell'=-L_{\text{max}}}^{L_{\text{max}}} (\omega^{(+)}_\alpha(q,n,\ell) - \omega^{(-)}_\alpha(q,n,\ell'))}{\prod_{\ell'=-L_{\text{max}}, \ell' \neq \ell}^{L_{\text{max}}} (\omega^{(+)}_\alpha(q,n,\ell) - \omega^{(-)}_\alpha(q,n,\ell'))} \]
Response of dispersive gold sphere – Dispersion models

\[ \varepsilon(\omega) = \varepsilon_\infty - \frac{\omega_p^2}{\omega^2 + i\omega \Gamma_D} \]

\[ \sigma_\varepsilon = \frac{4\pi e^2}{3} n^2 \left( \frac{\omega_p^2}{\omega^2 + i\omega \Gamma_D} \right) \]

\[ \sigma_\varepsilon = \frac{4\pi e^2}{3} n^2 \left( \frac{\omega_p^2}{\omega^2 + i\omega \Gamma_D} \right) + n.r. \text{ contrib} \]

Drude Au

Drude-Lorentz Au

Converged RSs + n.r. contribution

Exact \( \sigma \)

Exact \( \sigma \)

n.r. contrib

The regularization technique remains valid even for complex $K$ and $k$ where integrals diverge for large $r$

\[
\lim_{\eta \to 0} \int_{0}^{\infty} r^2 e^{-\eta r^2} j_n(Kr) y_n(kr) dr = -\frac{K^n}{k^{n+1} (K^2 - k^2)}
\]

\[
\lim_{\eta \to 0} \int_{0}^{\infty} r^2 e^{-\eta r^2} j_0(Kr) y_0(kr) dr = \lim_{\eta \to 0} \int_{0}^{\infty} e^{-\eta r^2} \sin(Kr) \cos(kr) dr = -\frac{1}{k(K^2 - k^2)}
\]

$K = 2 + i, k = 3, \eta = 0$

$K = 2 + i, k = 3, \eta = 0.03$
For a sphere there are exact expressions for RS normalization

\[ \tilde{N}_{\alpha(e,n,\ell)}^2 = z_\alpha^2 (\mu_\alpha - 1) + (\varepsilon_\alpha - 1) \left\{ \left[ \varphi_n^{(+)}(z_\alpha) \right]^2 + \frac{n(n+1)}{\varepsilon_\alpha} \right\} \]

\[ + \frac{\omega_\alpha}{2} \left\{ \tilde{\Xi}_{\alpha(e,n,\ell)}^{(+)} \frac{d}{d\omega} \ln \varepsilon_\alpha(\omega) \bigg|_{\omega_\alpha} + \tilde{\Xi}_{\alpha(e,n,\ell)}^{(-)} \frac{d}{d\omega} \ln \mu_\alpha(\omega) \bigg|_{\omega_\alpha} \right\} \]

\[ \tilde{N}_{\alpha(h,n,\ell)}^2 = z_\alpha^2 (\varepsilon_\alpha - 1) + (\mu_\alpha - 1) \left\{ \left[ \varphi_n^{(+)}(z_\alpha) \right]^2 - \frac{n(n+1)}{\mu_\alpha} \right\} \]

\[ + \frac{\omega_\alpha}{2} \left\{ \tilde{\Xi}_{\alpha(h,n,\ell)}^{(-)} \frac{d}{d\omega} \ln \varepsilon(\omega) \bigg|_{\omega_\alpha} + \tilde{\Xi}_{\alpha(h,n,\ell)}^{(+)} \frac{d}{d\omega} \ln \mu(\omega) \bigg|_{\omega_\alpha} \right\} , \]

\[ \tilde{\Xi}_{\alpha(e,n,\ell)}^{(\pm)} \equiv \varepsilon_\alpha \left[ \varphi_n^{(+)}(z_\alpha) \right]^2 + \mu_\alpha z_\alpha^2 - \frac{n(n+1)}{\varepsilon_\alpha} \pm \varphi_n^{(+)}(z_\alpha) \]

\[ \tilde{\Xi}_{\alpha(h,n,\ell)}^{(\pm)} \equiv \mu_\alpha \left[ \varphi_n^{(+)}(z_\alpha) \right]^2 + \varepsilon_\alpha z_\alpha^2 - \frac{n(n+1)}{\mu_\alpha} \pm \varphi_n^{(+)}(z_\alpha) , \]
Gaussian vs PML regularization scheme

`Killing Mie softly’ - Regularization!

\[
\lim_{\eta \to 0} \int_1^\infty r^2 e^{-\eta r^2} \left[ h_n^+(zr) \right] dr = -\frac{1}{2} z \left[ \xi_n(z) \right]^2 + \xi_n^2(z) - n(n + 1)h_n^2(z) - h_n(z)\xi_n'(z) \frac{1}{k^3}
\]

\[z_{e,1,2} = 1.05 - i0.07 \quad \text{High Q}\]

\[\eta = 0\]
\[\ell = 2\]
\[\eta = 0.015\]
What is the “secret” to analytic results?  
"Killing Mie softly" - Regularization!

\[
\lim_{\eta \to 0} \int_{1}^{\infty} r^2 e^{-\eta r^2} \left[ h_n^{(+)}(zr) \right] dr = \frac{1}{2} z \frac{[\xi'_n(z)]^2 + \xi_n^2(z) - n(n+1)h_n^2(z) - h_n^{(+)}(z)\xi_n(z)}{k^3}
\]

\[z_{\alpha(e,1,1)} = 1.04 - i0.5 \quad \text{Low Q}\]

\[\eta = 0 \quad \ell = 1 \quad \eta = 0.5\]
Some more resonant state history

Thomson modes (1884)

Outgoing modes of a perfectly conducting sphere are associated with complex frequencies

$$\omega_q = \omega_q' - i\gamma_q$$

J. J. Thomson, *Proceedings of the London Mathematical Society* 1.1 (1883)

Lamb (1900)

Exponential catastrophe avoided by causality

`Leaky' cavities : open resonators

`Fox-Li’ modes : lasers

A. G. Fox and T. Li, "Resonant modes in an optical maser, "Proc. IRE(Correspondence), vol. 48, pp. 1904-1905, November1960.

`Whispering gallery’ modes
Spatial divergence is a far field effect

\[ \omega_q = \omega_q' + i \omega_q'' , \ \omega_q'' < 0 \]

Far field: \( \Delta \psi \rightarrow \frac{1}{r} \frac{\partial^2 (r \psi)}{\partial r^2} \)

\[
\frac{\partial^2}{\partial r^2} r \psi_r (r, t) = \frac{n^2}{c^2} \frac{\partial^2}{\partial t^2} r \psi_r (r, t) = - \frac{n^2}{c^2} \omega_q^2 r \psi_r (r, t)
\]

\[
\psi_r (r, t) = A_+ \frac{e^{i \omega_q (r-ct)}}{r} + A_- \frac{e^{i \omega_q (r+ct)}}{r}
\]

Exponentially decrease in time \( \mathbf{E}_q (r, t) \) \n
Exponentially divergence in \( r \) \( \mathbf{E}_q (r, t) \)

Exponential "catastrophe"
Normalization of eigenstates: numerical verification

\[ \Psi_\mathbf{q} \Gamma \Psi_\mathbf{q} = \varepsilon_\mathbf{r} e^{-\frac{q^2}{r^2}} \mu_\mathbf{r} h_\mathbf{q}^2 \mathbf{r} \]

\[ \mathbf{r} = z_\mathbf{q} = \omega \mathbf{q} = \frac{R}{c} \]

\[ \langle \Psi_\mathbf{q} | \hat{\mathbf{r}} | \Psi_\mathbf{q} \rangle = \int \left[ \varepsilon_\mathbf{r} e^{-\frac{q^2}{r^2}} - \mu_\mathbf{r} h_\mathbf{q}^2 \mathbf{r} \right] d\mathbf{r} = z_\mathbf{q} = \omega_\mathbf{q} \frac{R}{c} \]
Orthogonalization of eigenstates can be verified analytically for spherical scatterers!

Resonant state: \( |\Psi_q^{(e)}\rangle \equiv \left( \hat{e}_{n,m,q}(\hat{r}) \right) = \frac{i^n k^{3/2}}{N_{e,n,m,q}} \left( \hat{N}_{n,m}^{(+)}(k_q \hat{r}) \right) \)

Magnetic:

Electric:

\[
\left\langle \Psi_1^{(e)} | \hat{r} | \Psi_2^{(e)} \right\rangle = \int \left[ \varepsilon(\hat{r}) \hat{e}_1^{(e)}(\hat{r}) \hat{e}_2^{(e)}(\hat{r}) - \mu(\hat{r}) \hat{h}_1^{(e)}(\hat{r}) \hat{h}_2^{(e)}(\hat{r}) \right] d\hat{r} = 0
\]
Extending the regular rules of integration
Distribution theory!

\[
\lim_{\eta \to 0} \int_{0}^{\infty} r^2 e^{-\eta r^2} j_n(Kr)y_n(kr)dr = -\frac{K^n}{k^{n+1}(K^2 - k^2)}
\]

\[
\lim_{\eta \to 0} \int_{0}^{\infty} r^2 e^{-\eta r^2} j_0(Kr)y_0(kr)dr = \lim_{\eta \to 0} \int_{0}^{\infty} e^{-\eta r^2} \sin(Kr)\cos(kr)dr = -\frac{K}{(K^2 - k^2)}
\]

\[K = 2, k = 3, \eta = 0\]

\[K = 2, k = 3, \eta = 0.003\]
Other techniques like PMLs offer efficient numerical regularization of RS integrals.

The PML technique puts a perfectly matched layer that damps the exponential catastrophe inside the medium $\Omega_2$.

$$\left| \Psi_q \right| \frac{d}{d\omega} \left( \omega \hat{\Gamma}(\vec{r}, \omega) \right) \bigg|_{\omega=\omega_q} \Psi_q \right> = \int \left[ \frac{d[\omega \epsilon(\vec{r}, \omega)]}{d\omega} \bigg|_{\omega_q} \hat{\epsilon}_q^2(\vec{r}) - \frac{d[\omega \mu(\vec{r}, \omega)]}{d\omega} \bigg|_{\omega_q} \hat{h}_q^2(\vec{r}) \right] d\vec{r} = 1$$
Symmetries of the $S$-matrix coefficients

$$z \equiv kR = \frac{\omega}{c} R$$

Energy conservation

$$S_{n}^{(e)}(k_{q}^{*}R) = 0$$

Time reversal symmetry

$$\frac{1}{S_{n}^{(e)}(k_{q}R)} = 0$$
The above formulas exactly reconstruct the analytic Mie scattering results to arbitrary precision!
Resonant States (Quasi-Normal Modes)

Complex eigenstates of the time independent Maxwell equation

\[
\begin{bmatrix}
\omega_\alpha \left( \overrightarrow{\varepsilon}(\overrightarrow{r}, \omega_\alpha) \right) & 0 \\
0 & \omega_\alpha \left( \overrightarrow{\mu}(\overrightarrow{r}, \omega_\alpha) \right)
\end{bmatrix}
- ic \begin{pmatrix} 0 & \nabla \times \\ \nabla \times & 0 \end{pmatrix}
\begin{pmatrix}
\overrightarrow{e}_\alpha \\
\overrightarrow{h}_\alpha
\end{pmatrix} = 0
\]

\[\omega_\alpha \hat{\Gamma}_{\omega_\alpha} |\Psi_\alpha \rangle - \hat{L} |\Psi_\alpha \rangle = 0\]

RS/QNM are eigenstates with **outgoing boundary conditions**!

Electric dipole RSs frequencies satisfying outgoing boundary conditions, \(\omega_q R/c\), are the blue dots in the complex plane for a lossless high index sphere while **eigenvalues satisfying incoming boundary solutions** are red dots.
Explain physical phenomena using RS (QNMs) with well-defined normalizations

\[ \sigma_1^{(e)}/\pi R^2 \]

\[ \int_0^\infty (\varepsilon E^2 - H^2) \, dr = 1.05 - i \, 0.072 \]

\[ \int_0^\infty (\varepsilon E^2 - H^2) \, dr = 1.035 - i \, 0.5 \]

Egocentric physics : Just about Mie,,
Stout et al, EPL 119(4), 44002(7), (2017).
Maxwell equations can be written in a single equation 1st order equation

\[ |\Psi(\vec{r}, t)\rangle = \int_{-\infty}^{\infty} d\omega \left( \frac{\vec{e}(\vec{r}, \omega)}{\vec{h}(\vec{r}, \omega)} \right) e^{-i\omega t} = \int_{-\infty}^{\infty} d\omega |\Psi(\omega)\rangle e^{-i\omega t} \]

\[ \vec{e}(\vec{r}, -\omega^*) = \vec{e}^*(\vec{r}, \omega) \]
\[ \vec{h}(\vec{r}, -\omega^*) = \vec{h}^*(\vec{r}, \omega) \]
\[ \vec{j}(\vec{r}, -\omega^*) = \vec{j}^*(\vec{r}, \omega) \]

\[ \omega \begin{pmatrix} \vec{e}(\vec{r}, \omega) \\ 0 \end{pmatrix} - iC \begin{pmatrix} 0 \\ \nabla \times \end{pmatrix} \begin{pmatrix} \vec{e}(\vec{r}, \omega) \\ \vec{h}(\vec{r}, \omega) \end{pmatrix} = \begin{pmatrix} \vec{j}(\vec{r}, \omega)/i\varepsilon_0 \\ \vec{0} \end{pmatrix} \]

\[ \Gamma(\omega) |\Psi_\omega\rangle - \mathbb{L} |\Psi_\omega\rangle = |j_\omega\rangle \]

Time harmonic Maxwell equation!

\[ \hat{\Gamma}_{-\omega^*} = \hat{\Gamma}_\omega^\dagger \]
Spectral expansion of response functions

Time-harmonic equation of motion:
\[ \omega \hat{\Gamma}_\omega |\Psi_\omega\rangle - \hat{L}|\Psi_\omega\rangle = i|j_\omega\rangle \]

\[ \omega_\alpha \hat{\Gamma}_\omega |\Psi_\alpha\rangle - \hat{L}|\Psi_\alpha\rangle = 0 \quad |\Psi_\omega\rangle \equiv \mathbb{G}(\omega)|j_\omega\rangle \]

Spectral expansion of the Green’s function:
\[ (\omega \hat{\Gamma}_\omega - \hat{L}) \mathbb{G}(\omega) = i\Pi^{(+)} = i \sum_\alpha |\Psi_\alpha\rangle \langle \Gamma_\alpha |\Psi_\alpha\rangle \]

\[ \mathbb{G}(\omega) = i \sum_\alpha \frac{1}{\langle \Psi_\alpha | \frac{d}{d\omega} [\omega \Gamma(\omega)]_{\omega_\alpha} |\Psi_\alpha\rangle} \frac{|\Psi_\alpha\rangle \langle \Gamma_\alpha |\Psi_\alpha\rangle}{\omega - \omega_\alpha} + \mathbb{G}_{\text{n.r.}}(\omega) \]
Resonant states correspond to S and T-matrix poles:

\[ T_n(\omega_q) \to \infty \quad S_n(\omega_q) \to \infty \]

\[ G = G_0 + G_0 T G_0 \]

\[ [S] = 2 [T] + [I] \]
Orthogonalization and normalization relations

Regularization insures that the symmetric operator:

\[ \hat{\mathcal{L}} = ic \left( \begin{array}{cc} 0 & \nabla \times \\ \nabla \times & 0 \end{array} \right) \]

Operates in a symmetric manner on the RS states:

\[ \langle \hat{\mathcal{L}} \Psi_{\alpha} | \Psi_{\alpha} \rangle = \langle \Psi_{\alpha} | \hat{\mathcal{L}} \Psi_{\alpha} \rangle \]

Given the RS equation one obtains the following "orthogonality relation" for resonant states:

\[ \langle \Psi_{\alpha}(r') | [k_{\alpha} \hat{\Gamma}_{\omega \alpha} - k_{\alpha} \hat{\Gamma}_{\omega q}] | \Psi_{\alpha} \rangle = 0 \]

RS normalization for a dispersive medium particles:

\[ \langle \Psi_{\alpha} | \frac{d}{d\omega} \left( \omega \hat{\Gamma}(\mathbf{r}, \omega) \right) \bigg|_{\omega = \omega_q} | \Psi_{\alpha} \rangle = \int \left[ \frac{d[\omega \varepsilon(\mathbf{r}, \omega)]}{d\omega} \bigg|_{\omega_{\alpha}} \left( \overline{e}_{q}^2(\mathbf{r}) - \frac{d[\omega \mu(\mathbf{r}, \omega)]}{d\omega} \bigg|_{\omega_{\alpha}} \right) \overline{h}_{q}^2(\mathbf{r}) \right] d\mathbf{r} = \omega_{\alpha} R / c \]
Regularization of the inner product

Regularization renders inner products, $\langle \Psi_\alpha | \Psi_\alpha \rangle$ well defined:

Bra: $\langle \Psi_\alpha | = \left( \vec{e}_\alpha, \vec{h}_\alpha \right)$

Ket: $| \Psi_\alpha (r) \rangle = \left( \vec{e}_\alpha \right)$

Inner product: $\langle \Psi_\alpha | \Psi_\alpha \rangle = \int d\vec{r} \left( \vec{e}_\alpha (\vec{r}) \cdot \vec{h}_\alpha (\vec{r}) \right) \cdot \left( \vec{e}_\alpha (\vec{r}) \right)$

Developing the field on a multipole basis the Gaussian regularization can be reduced to regularizing integrals of spherical Hankel functions that integrated to infinity. We obtain analytical integrals of the form:

$$\lim_{\eta \to 0} \int_1^\infty r^2 e^{-\eta r^2} \left[ h_n^{(+)}(z_\alpha r) \right] dr = -\frac{1}{2} z_q \frac{[\xi_n'(z_\alpha)]^2 + \xi_n^2(z_\alpha) - n(n + 1)h_n^2(z_\alpha)}{k z_\alpha^3}$$

Outgoing spherical Hankel functions:

$h_n(z) = h_n^{(+)}(z) \equiv j_n(z) + i y_n(z)$

$\xi_n(z) \equiv z h_n^{(+)}(z)$

$h_0^{(+)}(z) = -\frac{i}{z} e^{iz}$

$h_1^{(+)}(z) = -e^{iz} \left( \frac{1}{z} + \frac{i}{z^2} \right)$

$\vdots$
Explain physical phenomena using RS (QNMs) with well-defined normalizations.

\[ \sigma_1^{(e)} / \pi R^2 = \frac{6\pi}{k^2} |a_1|^2 \]

\[ a_1 = \frac{\varepsilon_s}{\varepsilon_b} \frac{j_1(k_s R)\psi'_1(kR) - \psi'_1(k_s R)j_1(kR)}{j_1(k_s R)\xi'_1(kR) - \psi'_1(k_s R)h_1(kR)} \]

\( \ell = 1 \)

*Egocentric physics: Just about Mie*, Stout et al, EPL 119(4), 44002(7), (2017).
Dispersion models for real metals (Gold)

Drude model

\[ \varepsilon(\omega) = \varepsilon_\infty - \frac{\omega_p^2}{\omega^2 + i \omega \Gamma_D} \]

Drude-Lorenz model

\[ \varepsilon(\omega) = \varepsilon_\infty - \frac{\omega_{pD}^2}{\omega^2 + i \omega \Gamma_D} - s_1 \frac{\omega_{p1,L}^2}{\omega^2 - \omega_{p1,L}^2 + i \Gamma_{1,L} \omega} - s_2 \frac{\omega_{p2,L}^2}{\omega^2 - \omega_{p2,L}^2 + i \Gamma_{2,L} \omega} \]
Spectral expansions of the $S_{n,q}(\omega)$ and $T_{n,q}(\omega)$ functions for spherical scatterers

$$S_{n,q}(\omega) = (-1)^{n+q} e^{-2iz} + e^{-2iz} (-1)^{n+q} \sum_{\ell=-\infty}^{\infty} \frac{2r_{\alpha}}{z - z_{\alpha}}$$

$q = 0 \quad (h)$

$q = 1 \quad (e)$

**Electric dipole $S_{1}^{(e)}(z)$**

$$S_{1}^{(e)}(z) = \frac{\sigma_{1}^{(e)}}{\pi R^2} + \frac{6}{(kR)^2}$$

Unitary limit

$$z = \omega \frac{R}{c} = kR$$

$$z_{\alpha} = \omega_{\alpha} \frac{R}{c}$$

zeros

poles

$$\ell = 1$$

$$\ell = 2$$
\[ r_\alpha = \frac{i e^{2iz_\alpha}}{N_\alpha^2} \]

\[ T_{n,q}(\omega) = \frac{(-1)^{n+q} e^{-2iz}}{2} - 1 + e^{-2iz} \sum_{\ell=-\infty}^{\infty} \frac{r_\alpha}{z - z_\alpha} \]

Non-resonant term ! resonant state spectral expansion

\[ z = \omega \frac{R}{c} \]

\[ z_\alpha = \omega_\alpha \frac{R}{c} \]

\[ q = 0 \quad (h) \]

\[ q = 1 \quad (e) \]

T-matrix (Mie) residues are determined by RS normalization !
