**Abstract:** *Siphonops paulensis* Boettger, 1892 is a Neotropical siphonopid caecilian widely distributed in South America. Herein, we fill knowledge gaps in the distribution of *S. paulensis* mostly in northeastern Brazil, including four new state records.

**Key words:** Boettger’s caecilian; Bahia; Paraíba; Pará; Pernambuco; Brazil

The Neotropical genus *Siphonops* Wagler, 1828 currently includes five species: *S. annulatus* (Mikan, 1820), *S. hardyi* Boulegner, 1888, *S. paulensis* Boettger, 1892, *S. insulanus* Ihering, 1911 and *S. leucoderus* Taylor, 1968. Among them, *S. annulatus* and *S. paulensis* exhibit very similar morphology and are widely distributed in South America (Taylor 1968; Frost 2015). *Siphonops paulensis* has been recorded in Argentina, Bolivia, Brazil and Paraguay (Taylor 1968; Frost 2015). In Brazil, this species can be found mainly across central and south portions of the country (Taylor 1970), but recent studies have reported a few additional records from northeastern Brazil (e.g., Loebmann and Haddad 2010; Valdujo et al. 2011; Miranda et al. 2012; Santana et al. 2015). Herein, we continue to fill knowledge gaps in the distribution of *S. paulensis*, mostly in northeastern Brazil.

Eighteen specimens of *S. paulensis* were examined by one of us (TM) during a survey on caecilians in seven Brazilian biological collections: Coleção Herpetológica do Departamento de Botânica, Ecologia e Zoologia da Universidade Federal do Rio Grande do Norte (CHBEZ), Coleção Herpetológica da Universidade Federal da Paraíba (CHUFPB), Coleção Herpetológica da Universidade Federal Rural de Pernambuco (CHUFREPE), Museu de Ciências Naturais da Pontifícia Universidade Católica de Minas Gerais (MCNAM), Universidade Estadual de Feira de Santana (UEFS), Universidade Federal da Bahia (UFBA) and Universidade Federal de Minas Gerais (UFMG). These specimens represent four new state records for Brazil (Bahia, Pará, Paraíba and Pernambuco states) and add five new municipality records in Minas Gerais state and one in Rio Grande do Norte state for the distribution of *S. paulensis* (Figure 1). Vouchers, geographic coordinates, body lengths and the number of body annuli of *S. paulensis* specimens are shown in Table 1.

According to Taylor (1968), *S. annulatus* and *S. paulensis* differ in the number of body annuli following the collars (78–98 in the first and 100–118 in the later) and the coloration (bluish-black to slate in the first and slate-blue to live slate or brownish to violet-brown in the latter). The taxonomic identification of all 18 specimens was made following Taylor (1968).

Four new Brazilian state records of *S. paulensis* are reported here (Bahia, Pará, Paraíba and Pernambuco; Figure 1). The record for Bahia is from Serra do Orobó at Ruy Barbosa municipality, whereas the nearest specimen previously collected is from Simão Dias, Sergrpe State (ca. 350 km northeast; Santana et al. 2015). The northernmost record of *S. paulensis* in Brazil is our new record for the Pará state, at Oriximiná municipality, ca. 1,300 km north of the nearest location known for the species at Cláudia, Mato Grosso state (Faria and Mott 2011). The record for Paraíba is in João Pessoa municipality, ca. 175 km north of the closest
For Minas Gerais and Rio Grande do Norte states, we add five and one new municipality records of *Siphonops paulensis*. Grão Mogol, Salinas, Belo Horizonte, Nova Lima, São Gonçalo do Rio Abaixo and Felipe Guerra, respectively. Grão Mogol and Salinas are ca. 220 km and 306 km east and Belo Horizonte, Nova Lima and São Gonçalo do Rio Abaixo, respectively.

**Figure 1.** Distributional records of *Siphonops paulensis*. Circles = literature records; square = type locality; triangles = new records; asterisks = localities where there are sympathy with *Siphonops annulatus*. Localities and references: 1. São Paulo, SP, Brazil (Boettger 1892); 2. Teresópolis, RJ, Brazil (Sawaya 1937); 3. San Ignacio, Argentina (Dunn 1942); 4. Buena Vista, Bolivia (Dunn 1942); 5. Santa Cruz de la Sierra, Bolivia (Dunn 1942); 6. Anápolis, GO, Brazil (Dunn 1942); 7. Corumbá, MS, Brazil (Dunn 1942); 8. Taubaté, SP, Brazil (Dunn 1942); 9. Villarrica, Paraguay (Dunn 1942); 10. Ceará Mirim, RN, Brazil (Schmidt and Inger 1951); 11. Araracuara, SP, Brazil (Species Link, collected in 1969); 12. Ilha Solteira, SP, Brazil (Species Link, collected in 1973); 13. Cruz Alta, RS, Brazil (Braun and Braun 1980); 14. São Borja, RS, Brazil (Braun and Braun 1980); 15. Tenente Portela, RS, Brazil (Braun and Braun 1980); 16. Três Passos, RS, Brazil (Species Link, collected in 1991); 17. Tatui, SP, Brazil (Species Link, collected in 2000); 18. Brasília, DF, Brazil (Kokubum and Menin 2001); 19. Uberlândia, MG, Brazil (Kokubum and Menin 2001); 20. Minaçu, GO, Brazil (Souza et al. 2002); 21. Formosa, GO, Brazil (Schwartz et al. 2003); 22. Aporé, GO, Brazil (Vaz-Silva et al. 2007); 23. Mambai, GO, Brazil (Cintra et al. 2009); 24. Sonora, MS, Brazil (Silva-Júnior et al. 2009); 25. São Miguel Arcanjo, SP, Brazil (Forlani et al. 2010); 26. Ibirapuera, CE, Brazil (Loebmann and Haddad 2010); 27. Itu, SP, Brazil (Species Link, collected in 2010); 28. Alto Taquari, MT, Brazil (Faria and Mott 2011); 29. Caceres, MT, Brazil (Faria and Mott 2011); 30. Chapada dos Guimarães, MT, Brazil (Faria and Mott 2011); 31. Cláudia, MT, Brazil (Faria and Mott 2011); 32. Cuiabá, MT, Brazil (Faria and Mott 2011); 33. Poconé, MT, Brazil (Faria and Mott 2011); 34. Vila Bela de Santissíssima Trindade, MT, Brazil (Faria and Mott 2011); 35. Frederico Westphalen, RS, Brazil (Lema and Martins 2011); 36. Almas, TO, Brazil (Valdujo et al. 2011); 37. Estreito, MA, Brazil (Species Link, collected in 2011); 38. São Romão, MG, Brazil (Species Link, collected in 2011); 39. Chapadinhos, MA, Brazil (Miranda et al. 2013); 40. Alto Paraíso de Goiás, GO, Brazil (Species Link, collected in 2013); 41. Simão Dias, SE, Brazil (Santana et al. 2013); 42. Maceió, AL, Brazil (submitted); 43. Murici, AL, Brazil (submitted); 44. Rio Largo, AL, Brazil (submitted); 45. Bom Jesus, RS, Brazil (Species Link, no collection date); 46. Porto Mauá, RS, Brazil (Species Link, no collection date); 47. Serra do Orobó, Ruy Barbosa, BA, Brazil (this study); 48. Belo Horizonte, MG, Brazil (this study); 49. Grão Mogol, MG, Brazil (this study); 50. Nova Lima, MG, Brazil (this study); 51. Salinas, MG, Brazil (this study); 52. São Gonçalo do Rio Abaixo, MG, Brazil (this study); 53. Oriximiná, PA, Brazil (this study); 54. João Pessoa, PB, Brazil (this study); 55. Arcoverde, PE, Brazil (this study); 56. Felipe Guerra, RN, Brazil (this study).

location previously known for the species at Ceará Mirim, Rio Grande do Norte state (Schmidt and Inger 1951). The record for Pernambuco is located at Arcoverde municipality, ca. 150 km northwest from the nearest site of occurrence of the species at Murici, Alagoas state (submitted).
accurate identification. Dunn (1942) already reported our apprehension regarding their taxonomic validity and morphological differentiation between them reinforces these species in at least seven localities plus the discrete and Martins 2011; Valdujo et al. 2011). The sympatry of Valdujo et al. 2011) or voucher specimens (Schwartz et al. 2009; Forlani et al. 2010; Faria and Mott 2011; Braun 1980; Kokubum and Menin 2001; Schwartz et al. 2009; Forlani et al. 2010; Faria and Mott 2011) at one locality (Chapada dos Guimarães National Park, Mato Grosso state). A both species sympatric at two localities (Taubaté, São Paulo state, PE = Pernambuco state, RN = Rio Grande do Norte state. Abaixo are ca. 405 km, 425 km, and 420 km southeast from the nearest location at São Romão, Minas Gerais state (Species Link 2012). Felipe Guerra is ca. 245 km west from the closest location previously known for the species at Ceará Mirim municipality, Rio Grande do Norte state (Schmidt and Inger 1951) (Figure 1). We found a misidentification rate of 66% (12 from 18) of S. paulensis specimens in seven Brazilian collections, which have raised our concerns regarding the veracity of distribution records of S. paulensis and S. annulatus in articles that do not provide meristic data (Braun and Braun 1980; Kokubum and Menin 2001; Schwartz et al. 2003; Vaz-Silva et al. 2007; Cintra et al. 2009; Silva et al. 2009; Forlani et al. 2010; Faria and Mott 2011; Valdujo et al. 2011) or voucher specimens (Schwartz et al. 2003; Vaz-Silva et al. 2007; Silva et al. 2009; Lema and Martins 2011; Valdujo et al. 2011). The sympathy of these species in at least seven localities plus the discrete morphological differentiation between them reinforces our apprehension regarding their taxonomic validity and accurate identification. Dunn (1942) already reported both species sympatric at two localities (Taubaté, São Paulo state and Teresópolis, Rio de Janeiro state), and Farias and Mott (2011) at one locality (Chapada dos Guimarães National Park, Mato Grosso state). A taxonomic revision of S. annulatus and S. paulensis is urgently needed. We recommend the collection of tissue samples in order to generate further morphological and molecular data to address this question.

Table 1. Localities and morphological data of the new records of Siphonops paulensis in Brazil. Acronyms of Zoological Collections are represented by:

| Voucher   | Municipality, State | Latitude | Longitude | Body length (mm) | Body annuli |
|-----------|---------------------|----------|-----------|------------------|-------------|
| CHBEZ 2842 | Felipe Guerra, RN    | 05°32'03" S | 03°39'09" W | 131              | 116         |
