Abstract

Bulbophyllum reflexipetalum, a new species from Motuo County, Southeast Xizang, China, is described and illustrated here. This new species belongs to Bulbophyllum sect. Umbellata Bentham & J. D. Hooker, and it is morphologically similar to B. umbellatum Lindley, B. guttulatum (J. D. Hooker) N. P. Balakrishnan and B. salweenensis X.H. Jin, but is distinguished from them by having reflexed petals, base of dorsal sepal with 1 dentate on each side, lip with significantly revolute margin, adaxially with dark brown spots or patches and one longitudinal groove.

Keywords

Taxonomy, Bulbophyllum, Section Umbellata, Xizang Province, China
Introduction

*Bulbophyllum* Thouarm (Orchidaceae) is one of the three largest genera in the orchid family, comprising about 2200 species widely distributed in tropical Africa, Asia and America (Lang and Tsi 1987, Pridgeon et al. 2014). There are about 105 species in China (Chen and Vermeulen 2009), with several new species described in recent years (Zhou and Jin 2015, Liu et al. 2016, Zhai et al. 2017). Motuo is an important area in the eastern Himalaya biodiversity hotspot, but the species diversity in this region is poorly known, and some new taxa are discovered and described in recent years (Lai and Jin 2012, Huang et al. 2013, Raskoti et al. 2017). More conservation efforts are needed in this region to counteract the increasing anthropogenic disturbance and destruction. During our field survey in Motuo County, Xizang Autonomous Region, a new *Bulbophyllum* species of sect. *Umbellata* Bentham & J. D. Hooker was found in the subtropical broad-leaved forest and described below.

Materials and methods

Type specimens were collected in Motuo County, Xizang Autonomous Region, China, during a field expedition in 2016. Photographs were taken in field. Shapes, colors and other details given in the description were based on living materials (five individuals). The column and pollinia morphological photographs were taken using an Olympus SZX16. Voucher specimens were deposited at the herbarium of Kunming Institute of Botany, Chinese Academy of Sciences (KUN). The conservation status of the new species was evaluated based on the guidelines of the International Union for Conservation of Nature (IUCN 2012).

Taxonomy

*Bulbophyllum reflexipetalum* J.D.Ya, Y.J.Guo & C.Liu, sp. nov. urn:lsid:ipni.org:names:77201398-1

Figure 1, 2

**Diagnosis.** *Bulbophyllum reflexipetalum* is similar to *B. salweenensis* X.H. Jin, *B. umbellatum* Lindley and *B. guttulatum* (J. D. Hooker) N. P. Balakrishnan in terms of morphological structure and shape of the flowers. The new species can be distinguished from *B. salweenensis* by the absence of sheaths on the pseudobulbs and rhizome, scape longer than leaf and petals apex mucronate. It can be distinguished from *B. umbellatum* with smaller and flattened void or ovoid-conic pseudobulbs, shorter leaf blade, petals apex caudate. In addition, the new species can be distinguished from *B. guttulatum* with leaf blade oblong and apex emarginated, shorter pedicel and ovary, lip papillae with a single longitudinal ridge.

**Type.** CHINA. Xizang Autonomous Region: Motuo, subtropical, evergreen broad-leaved forest, 1378 m, 17 Mar 2016, J.-D. Ya, Y.-J. Guo, Q.-R. Zhang 18HT1419 (holotype: KUN).
**Bulbophyllum reflexipetalum**, a new species from Xizang, China

**Description.** Epiphytic herbs. Rhizome creeping and rooting, 3–4 mm in diam. Roots arising from the nodes, 0.5–1.5 mm in diam. Pseudobulbs often 1–2 cm apart on rhizome, flattened ovoid or ovoid-conic, ca. 10–16 × 8–15 mm, with a terminal leaf. Leaf blade oblong, 50–65 × 15–20 mm, leathery, apex obtuse and emarginate, base narrowing into a petiole; petiole 10–20 mm. Scape arising from the base of pseudobulb, 13–20 cm long, longer than leaf; umbellate, often 3–4-flowered; peduncle ca. 1.5 mm in diam, with 3 tubular sheaths; floral bract lanceolate, acuminate, concave, ca. 6.3 × 2.0 mm; peduncle and ovary ca. 10–15 mm long. Flowers greenish yellow, sepals and petals with dark brown spots; lip greenish yellow, adaxially with dark brown spots or patches. Dorsal sepal ovate, concave, apex obtuse, base with 1 dentate on each side, ca. 8.10 × 4.95 mm, 5-veined; lateral sepals falcate-lanceolate, base adnate to column foot, twisted inward near base, ca. 10.30 × 5.26 mm, 5-veined; Petals reflexed, broadly ovate-triangular, ca. 3.23 × 2.52 mm, 1-veined, margin entire, apex mucronate; lip deflexed, triangular-lingulate, ca. 4.02 × 2.94 mm, base subcordate with papillae on the edge, margin revolute, apex obtuse, adaxially with a longitudinal ridge from base to apex, abaxially with a longitudinal groove; column ca. 3.25 mm, with deltoid, rounded wings along lower margins, stelidia deltoid, ca. 1 mm, foot ca. 6.86 mm, apex attached to lip; anther cap subglobose with many longitudinal lamellae when dry. pollinia 4, in 2 pairs, 0.72–0.93 mm, yellow, ovate, waxy, attached to sticky substance. Fl. February–March.

**Etymology.** The specific epithet “reflexipetalum” refers to reflexed petals of this new species.

**Vernacular name.** Fan Ban Juan Ban Lan (Chinese pronunciation); 反瓣卷瓣兰 (Chinese name).

**Distribution and habitat.** Bulbophyllum reflexipetalum is currently known only from the type locality of Motuo, Southeast Xizang, China. It is a predominantly epiphytic species that grows on tree trunks, under broadleaf evergreen forest at the elevation between 1300 m and 1400 m.
Bulbophyllum reflexipetalum, a new species from Xizang, China

Conservation status. During our 2-weeks field survey, only 2 populations were found. As this new species may also grow in the broadleaf evergreen forest of vicinity region, we regard its status as Data Deficient (IUCN 2012).

Discussion

Bulbophyllum reflexipetalum belongs to sect. Umbellata based on the umbellate inflorescence (Chen and Vermeulen 2009). Morphologically, this new species is similar to B. salweenensis, B. umbellatum and B. guttulatum in terms of vegetative morphology and shape of the flowers (Figure 3), but is easily recognized by its reflexed petals, the dentate of dorsal sepal and the revolute margin of lip (Table 1). Beyond that, B. reflexipetalum can be distinguished from B. salweenensis by the absence of sheaths on the pseudobulbs and rhizome (vs. pseudobulbs and rhizome with sheaths), scape longer than leaf and petals apex mucronate (vs. the scape shorter than leaf); it differs from B. umbellatum with smaller and flattened void or ovoid-conic pseudobulbs, shorter leaf blade, petals apex caudate (vs. obtuse-rounded petals).

Table 1. Morphological comparison of Bulbophyllum reflexipetalum and its closely related species.

| Characters          | Bulbophyllum reflexipetalum | B. salweenensis | B. umbellatum | B. guttulatum |
|---------------------|-----------------------------|----------------|---------------|---------------|
| Pseudobulbs         | flattened ovoid or ovoid-conic, without sheaths | oviod-conic, with sheaths | oviod-conic or narrowly ovoid, without sheaths | oviod or oviod-conic, without sheaths |
| Leaf blade          | 10–16 × 8–15 mm | 10–40 × 4–6 mm | 20–25 × 7–10 mm | 13–35 × 10–20 mm |
| Scape               | 13–20 cm, longer than leaf | 4–9 cm, shorter than leaf | 10–15 cm | 8–12 cm |
| Pedicel and ovary   | 10–15 mm | ca. 10 mm | ca. 20 mm | ca. 25 mm |
| Flowers             | greenish yellow with dark brown spots | greenish yellow with purplish red spots | dark greenish yellow or brown with purplish apex | yellow with red spots |
| Dorsal sepal        | ovate, apex obtuse, base with 1 dentate | ovate, acuminated, entire | ovate, concave, apex acute | broadly ovate, apex mucronulate |
| Petals              | Reflexed, broadly ovate-triangular, ca.3.23 × 2.52 mm, apex mucronate | lanceolate, denticulate, ca. 5 × 2 mm, apex caudate | ovate, ca. 7 × 5 mm, obtuse-rounded | broadly ovate-triangular, ca. 4.5 × 4 mm, apex mucronate |
| Lip                 | greenish yellow, adaxially with dark brown spots or patches | whitish purple at base, pink at apex, keel pink. | white | white with purple spots |
|                     | triangular-lingulate, apex obtuse, ca. 4.02×2.94 mm | lingulate, apex obtuse, ca. 8×3 mm; | lingulate, apex obtuse, ca. 8×3 mm; | subovate, apex emarginated, 5 × 3.4 mm |
|                     | adaxially papillae with a longitudinal ridge, margin revolute, abaxial with a longitudinal groove; | adaxially papillae with a longitudinal ridge | adaxially papillae with a longitudinal ridge | adaxially with 3 longitudinal ridges |
and it differs from *B. guttulatum* with leaf blade oblong and apex emarginated (vs. leaf blade elliptic-oblong and apex rounded), shorter pedicel and ovary, lip papillae with a single longitudinal ridge (lip with three ridges in *B. guttulatum*) (Chen and Vermeulen 2009, Zhou and Jin 2015).

**Acknowledgements**

We are grateful to Xiaohua Jin, Chao Hu for their valuable discussion and suggestions. We convey our special thanks to Qiaorong Zhang, Huajie He, Shaofa Qin, Fengqiong Zhang and Changhong Li for their kind assistance in the field. This study was financially supported by National Science & Technology Infrastructure and the Large-scale Scientific Facilities of the Chinese Academy of Sciences (2017-LSFGBOWS-02).
