Some Isomorphism Theorems for MVD-algebras

Elza Ivanova-Dimova*

Dept. of Math. and Informatics, Sofia University, J. Bourchier 5, 1126 Sofia, Bulgaria

Abstract

In the papers [5, 6, 7] many Stone-type duality theorems for the category of locally compact Hausdorff spaces and continuous maps and some of its subcategories were proved. The dual objects in all these theorems are the local contact algebras. In [17] the notion of an MVD-algebra was introduced and it was shown that it is equivalent to the notion of a local contact algebra. In this paper we express the duality theorems mentioned above in a new form using MVD-algebras and appropriate morphisms between them instead of local contact algebras and the respective morphisms.

Keywords: MVD-algebra; Local contact algebra; Locally compact spaces; Skeletal maps; (Quasi-)Open perfect maps; Open maps; Duality; Isomorphism

Introduction

The idea of building a region-based theory of space belongs to A. N. Whitehead [18] and T. de Leguna [3]. Survey papers describing various aspects and historical remarks on region-based theory of space are [10, 1, 16, 14]. With the help of the notion of a region-based topology (which is called local contact algebra (briefly, LC-algebra) in [8]) Roeper [15] gave one of the possible first-order axiomatizations for region-based theory of space. The notion of the region-based topology is based on two primitive spatial relations: contact and the one-place relation of limitedness. An attempt to give a different formulation of the same theory using only one primitive relation, called interior parthood, was made by Mormann [12] but, as it

1E-mail address: elza@fmi.uni-sofia.bg
was pointed out in [17], the obtained notion of an enriched Boolean algebra was more general than it was necessary; the right axiomatization with only one primitive relation was given in [17], where the appropriate notion of an MVD-algebra was introduced. In [5, 6] Dimov defined categories DHLC, DSkeLC, DSkePerLC, DOpLC and DOpPerLC whose objects are all complete local contact algebras and whose morphisms are some appropriate functions between them. These categories are dual to the categories of all locally compact Hausdorff spaces and, respectively, all continuous maps, all continuous skeletal maps, all skeletal perfect maps, all open maps and all open perfect maps. Here we define five categories MVDSkeLC, MVDSkePerLC, MVDOpLC, MVDOpPerLC and MVDHLC whose objects are all complete MVD-algebras and whose morphisms are some appropriate functions between them, and we prove that these categories are isomorphic, respectively, to the categories DSkeLC, DSkePerLC, DOpLC, DOpPerLC and DHLC.

We now fix the notations. If $\mathcal{C}$ denotes a category, we write $X \in |\mathcal{C}|$ if $X$ is an object of $\mathcal{C}$, and $f \in \mathcal{C}(X,Y)$ if $f$ is a morphism of $\mathcal{C}$ with domain $X$ and codomain $Y$.

All lattices will be with top (= unit) and bottom (= zero) elements, denoted respectively by 1 and 0. We do not require the elements 0 and 1 to be distinct.

If $(X, \tau)$ is a topological space and $M$ is a subset of $X$, we denote by $\text{cl}_{(X,\tau)}(M)$ (or simply by $\text{cl}(M)$) the closure of $M$ in $(X, \tau)$ and by $\text{int}_{(X,\tau)}(M)$ (or briefly by $\text{int}(M)$) the interior of $M$ in $(X, \tau)$.

The closed maps and the open maps between topological spaces are assumed to be continuous but are not assumed to be onto. Recall that a map is perfect if it is closed and compact (i.e. point inverses are compact sets). A continuous map $f : X \to Y$ is called quasi-open ([11]) if for every non-empty open subset $U$ of $X$, $\text{int}(f(U)) \neq \emptyset$; a function $f : X \to Y$ is called skeletal if $\text{int}(\text{cl}(f(U))) \neq \emptyset$, for every non-empty open subset $U$ of $X$.

## 1 Preliminaries

**Definition and Proposition 1.1** Let us recall the notion of lower adjoint for posets. Let $\varphi : A \to B$ be an order-preserving map between posets. If

$$\varphi_A : B \to A$$

is an order-preserving map satisfying the following condition

($\Lambda$) for all $a \in A$ and all $b \in B$, $b \leq \varphi(a)$ iff $\varphi_A(b) \leq a$

(i.e., the pair $(\varphi_A, \varphi)$ forms a Galois connection between posets $B$ and $A$) then we will say that $\varphi_A$ is a lower adjoint of $\varphi$. It is easy to see that condition ($\Lambda$) is equivalent to the following two conditions:

($\Lambda_1$) $\forall b \in B, \varphi(\varphi_A(b)) \geq b$;

($\Lambda_2$) $\forall a \in A, \varphi_A(\varphi(a)) \leq a$. 

2
Fact 1.2 ([5]) If \( A \) and \( B \) are Boolean algebras, \( \varphi : A \to B \) is a Boolean homomorphism, \( A \) has all meets and \( \varphi \) preserves them, then \( \forall a \in A \) and \( \forall b \in B \),
\[
\varphi \Lambda (\varphi(a) \land b) = a \land \varphi \Lambda (b).
\]

Definition 1.3 An algebraic system \((B, 0, 1, \lor, \land, *, C)\) is called a contact Boolean algebra or, briefly, contact algebra (abbreviated as CA or C-algebra) ([8]) if the system \((B, 0, 1, \lor, \land, *)\) is a Boolean algebra (where the operation “complement” is denoted by “\( * \)”) and \( C \) is a binary relation on \( B \), satisfying the following axioms:

(C1) If \( a \neq 0 \) then \( aCa \);
(C2) If \( aCb \) then \( a \neq 0 \) and \( b \neq 0 \);
(C3) \( aCb \) implies \( bCa \);
(C4) \( aC(b \lor c) \iff aCa \) or \( aCc \).

We shall simply write \((B, C)\) for a contact algebra. The relation \( C \) is called a contact relation. When \( B \) is a complete Boolean algebra, we will say that \((B, C)\) is a complete contact Boolean algebra or, briefly, complete contact algebra (abbreviated as CCA or CC-algebra). If \( D \subseteq B \) and \( E \subseteq B \), we will write “\( DCE \)” for “\( \forall d \in D \)(\( \forall e \in E \)(\( dCe \)))”.

We will say that two C-algebras \((B_1, C_1)\) and \((B_2, C_2)\) are CA-isomorphic iff there exists a Boolean isomorphism \( \varphi : B_1 \to B_2 \) such that, for each \( a, b \in B_1 \), \( aC_1 b \iff \varphi(a)C_2 \varphi(b) \). Note that in this paper, by a “Boolean isomorphism” we understand an isomorphism in the category \( \text{BoolAlg} \) of Boolean algebras and Boolean homomorphisms.

A CA \((B, C)\) is called connected if it satisfies the following axiom:

(CON) If \( a \neq 0, 1 \) then \( aCa^* \).

A contact algebra \((B, C)\) is called a normal contact Boolean algebra or, briefly, normal contact algebra (abbreviated as NCA or NC-algebra) ([4, 9]) if it satisfies the following axioms (we will write “\( -C \)” for “\( \lnot C \)”):

(C5) If \( a(-C)b \) then \( a(-C)c \) and \( b(-C)c^* \) for some \( c \in B \);
(C6) If \( a \neq 1 \) then there exists \( b \neq 0 \) such that \( b(-C)a \).

A normal CA is called a complete normal contact Boolean algebra or, briefly, complete normal contact algebra (abbreviated as CNCA or CNC-algebra) if it is a CCA. The notion of normal contact algebra was introduced by Fedorchuk [9] under the name Boolean \( \delta \)-algebra as an equivalent expression of the notion of compingent Boolean algebra of de Vries (see its definition below). We call such algebras “normal contact algebras” because they form a subclass of the class of contact algebras and naturally arise in normal Hausdorff spaces.

For any CA \((B, C)\), we define a binary relation “\( \ll_C \)” on \( B \) (called non-tangential inclusion) by “\( a \ll_C b \iff a(-C)b^* \)” . Sometimes we will write simply “\( \ll \)” instead of “\( \ll_C \)”. This relation is also known in the literature under the following names: “well-inside relation”, “well below”, “interior parthood”, “non-tangential proper part” or “deep inclusion”.

3
The relations $C$ and $\ll$ are inter-definable. For example, normal contact algebras could be equivalently defined (and exactly in this way they were introduced (under the name of compingent Boolean algebras) by de Vries in [4]) as a pair of a Boolean algebra $B = (B, 0, 1, \lor, \land, *)$ and a binary relation $\ll$ on $B$ subject to the following axioms:

1. $a \ll b$ implies $a \leq b$;
2. $0 \ll 0$;
3. $a \leq b \ll c \leq t$ implies $a \ll t$;
4. $a \ll c$ and $b \ll c$ implies $a \lor b \ll c$;
5. If $a \ll c$ then $a \ll b \ll c$ for some $b \in B$;
6. If $a \neq 0$ then there exists $b \neq 0$ such that $b \ll a$;
7. $a \ll b$ implies $b^* \ll a^*$.

The proof of the equivalence of the two definitions of normal contact algebras is straightforward and analogous to the corresponding statement for proximity spaces (see Theorems 3.9 and 3.11 in [13]). One has just to show that $xCy$ iff $x \not\ll y^*$.

Obviously, contact algebras could be equivalently defined as a pair of a Boolean algebra $B$ and a binary relation $\ll$ on $B$ subject to the axioms ($\ll$1)-($\ll$4) and ($\ll$7).

It is easy to see that axiom (C5) (resp., (C6)) can be stated equivalently in the form of ($\ll$5) (resp., ($\ll$6)).

**Definition 1.4** ([15, 8]) An algebraic system $\mathcal{B} = (B, 0, 1, \lor, \land, *, \rho, \mathbb{B})$ is called a local contact algebra (abbreviated as LCA) if $(B, 0, 1, \lor, \land, *)$ is a Boolean algebra, $\rho$ is a binary relation on $B$ such that $(B, \rho)$ is a CA, and $\mathbb{B}$ is a subset of $B$, satisfying the following axioms:

1. $0 \in \mathbb{B}$;
2. For $a, b \in B$, $a \leq b$ and $b \in \mathbb{B}$ implies $a \in \mathbb{B}$;
3. $a, b \in \mathbb{B}$ implies $a \lor b \in \mathbb{B}$;
4. If $a \in \mathbb{B}$, $c \in B$ and $a \ll c$ then there exists $b \in \mathbb{B}$ such that $a \ll b \ll c$ (see 1.3 for “$\ll$”);
5. If $a \rho b$ then there exists an element $c$ of $\mathbb{B}$ such that $a \rho (c \land b)$;
6. If $a \neq 0$ then there exists $b \in \mathbb{B} \setminus \{0\}$ such that $b \ll a$.

Usually, we shall write simply $(B, \rho, \mathbb{B})$ for a local contact algebra. We will say that the elements of $\mathbb{B}$ are bounded and the elements of $B \setminus \mathbb{B}$ are unbounded. When $B$ is a complete Boolean algebra, we will say that $(B, \rho, \mathbb{B})$ is a complete local contact algebra (abbreviated by CLCA).

We will say that two local contact algebras $(B, \rho, \mathbb{B})$ and $(B_1, \rho_1, \mathbb{B}_1)$ are LCA-isomorphic iff there exists a Boolean isomorphism $\varphi : B \rightarrow B_1$ such that, for $a, b \in B$, $a \rho b$ iff $\varphi(a) \rho_1 \varphi(b)$ and $\varphi(a) \in \mathbb{B}_1$ iff $a \in \mathbb{B}$.

An LCA $(B, \rho, \mathbb{B})$ is called connected if the CA $(B, \rho)$ is connected.

**Example 1.5** Recall that a subset $F$ of a topological space $(X, \tau)$ is called regular closed if $F = \text{cl} (\text{int}(F))$. Clearly, $F$ is regular closed iff it is the closure of an open set.
For any topological space \((X, \tau)\), the collection \(RC(X, \tau)\) (we will often write simply \(RC(X)\)) of all regular closed subsets of \((X, \tau)\) becomes a complete Boolean algebra \((RC(X, \tau), 0, 1, \wedge, \vee, ^*)\) under the following operations: \(1 = X, 0 = \emptyset, F^* = \text{cl}(X \setminus F), F \vee G = F \cup G, F \wedge G = \text{cl}(\text{int}(F \cap G))\). The infinite operations are given by the formulas: 
\[\bigvee \{F_\gamma \mid \gamma \in \Gamma\} = \text{cl}(\bigcup \{F_\gamma \mid \gamma \in \Gamma\}), \quad \text{and} \quad \bigwedge \{F_\gamma \mid \gamma \in \Gamma\} = \text{cl}(\text{int}(\bigcap \{F_\gamma \mid \gamma \in \Gamma\}))\].

It is easy to see that setting \(F_\rho(X, \tau)G\iff F \cap G \neq \emptyset\), we define a contact relation \(\rho(X, \tau)\) on \(RC(X, \tau)\); it is called a standard contact relation. So, \((RC(X, \tau), \rho(X, \tau))\) is a CCA (it is called a standard contact algebra). We will often write simply \(\rho_X\) instead of \(\rho(X, \tau)\). Note that, for \(F, G \in RC(X)\), \(F \ll_{\rho_X} G\iff F \subseteq \text{int}_{X}(G)\).

Clearly, if \((X, \tau)\) is a normal Hausdorff space then the standard contact algebra \((RC(X, \tau), \rho(X, \tau))\) is a complete NCA.

In [17] the following notion was introduced:

**Definition 1.6** ([17]) A triple \((B, \leq, \ll)\) is called an MVD-algebra if \((B, \leq)\) is a Boolean algebra and the axioms \((\ll1)\)-\((\ll6)\) (see 1.3) as well as the following two axioms are satisfied:

\((\ll 4^*)\) \(a \ll b\) and \(a \ll c\) imply \(a \ll b \wedge c\), and

\((\text{MVD})\) If \(a \ll 1\) and \(b^* \ll a^*\) then \(a \ll b\).

When \((B, \leq)\) is a complete Boolean algebra, we will say that \((B, \leq, \ll)\) is a complete MVD-algebra.

It follows immediately from the corresponding definitions that normal contact algebras coincide with MVD-algebras satisfying the additional axiom

\((\ll 2')\) \(1 \ll 1\).

**Proposition 1.7** ([17]) Let \(L\) be a locally compact Hausdorff space. Then

\[(RC(L), \subseteq, \ll_L),\]

where, for all \(F, G \in RC(L)\), \(F \ll_L G\iff F\) is compact and \(F \subseteq \text{int}(G)\), is an MVD-algebra. All such MVD-algebras will be called standard MVD-algebras.

**Theorem 1.8** ([17]) The notions of local contact algebra and MVD-algebra are equivalent. More precisely: let \(\kappa\) be the correspondence which assigns to every LCA \((B, \rho, \mathbb{B})\) an MVD-algebra \(\kappa(B, \rho, \mathbb{B}) = (B, \leq_l, \ll_l)\), where \(a \leq_l b\) if \(a \wedge b = a\), and

\[a \ll_l b\iff a \in \mathbb{B}\text{ and }a \ll_{\rho} b\]

(see 1.3 for “\(\ll_{\rho}\)”); further, let \(\theta\) be the correspondence which assigns to each MVD-algebra \((B, \leq, \ll)\) an LCA \((B, \rho_m, \mathbb{B}_m) = \theta(B, \leq, \ll),\) where

\[\mathbb{B}_m = \{a \in B \mid a \ll 1\}\]
and, for \(a, b \in B\),

\[
(3) \quad a \ll_{\rho_m} b \iff (\forall c \ll 1)[(c \land a) \ll (c^* \lor b)].
\]

(or, equivalently, \(a \rho_m b\) iff there exists \(c \ll 1\) such that \((c \land a) \not\ll (c \land b)^*\)). Then \(\kappa\) and \(\theta\) are bijective correspondences between the classes of all LCA's and all MVD-algebras, and \(\kappa = \theta^{-1}\).

The following obvious fact was noted in [2].

**Fact 1.9** ([2]) Let \((X, \tau)\) be a topological space. Then the standard contact algebra \((RC(X, \tau), \rho_{(X, \tau)})\) is connected iff the space \((X, \tau)\) is connected.

**Proposition 1.10** (a) Every quasi-open map is skeletal.

(b) ([5]) Let \(X\) be a regular space and \(f : X \rightarrow Y\) be a closed map. Then \(f\) is quasi-open iff \(f\) is skeletal.

**Definition 1.11** ([5]) Let \((B, \rho, B')\) be a local contact algebra. An ultrafilter \(u\) in \(B\) is called a bounded ultrafilter if \(u \cap B' \neq \emptyset\).

**Notation 1.12** If \(K\) is a category, then by \(\text{In}K\) (resp., \(\text{Su}K\)) we will denote the category having the same objects as the category \(K\) and whose morphisms are only the injective (resp., surjective) morphisms of \(K\).

**Notation 1.13** If \(K\) is a category whose objects form a subclass of the class of all topological spaces (resp., contact algebras) then we will denote by \(K\text{Con}\) the full subcategory of \(K\) whose objects are all “connected” \(K\)-objects, where “connected” is understood in the usual sense when the objects of \(K\) are topological spaces and in the sense of 1.3 (see the condition (CON) there) when the objects of \(K\) are contact algebras.

### 2 Isomorphism theorems for MVD-algebras

In [5], a category \(\text{DSkeLC}\) was introduced, namely, the objects of the category \(\text{DSkeLC}\) are all complete local contact algebras and its morphisms \(\varphi : (A, \rho, B) \rightarrow (B, \eta, B')\) are all complete Boolean homomorphisms satisfying the following conditions:

(L1) \(\forall a, b \in A, \varphi(a) \eta \varphi(b)\) implies \(a \rho b\);

(L2) \(b \in B'\) implies \(\varphi_A(b) \in B\) (see 1.1 for \(\varphi_A\)).

As it was proved in [5], the category \(\text{DSkeLC}\) is dually equivalent to the category \(\text{SkeLC}\) of all locally compact Hausdorff spaces and all continuous skeletal maps between them.

Let us note that (L1) is equivalent to the following condition:

\[\text{(L1')} \quad \forall a, b \in A, a \ll_{\rho} b \text{ implies } \varphi(a) \ll_{\eta} \varphi(b).\]
Definition 2.1 Let us define a category which will be denoted by \( \text{MVDSkeLC} \). Its objects are all complete MVD-algebras (see 1.6). If \((B, \leq, \ll)\) and \((B', \leq', \ll')\) are two complete MVD-algebras then \( \varphi : (B, \leq, \ll) \rightarrow (B', \leq', \ll') \) will be an \( \text{MVDSkeLC} \)-morphism iff \( \varphi : (B, \leq) \rightarrow (B', \leq') \) is a complete Boolean homomorphism satisfying the following axioms:

(S1) For every \( a, b \in B \), \( \left( \forall c \in B \text{ with } c \ll 1, (c \land a \ll c^* \lor b) \right) \) implies \( \left( \forall d \in B' \text{ with } d \ll' 1, (d \land \varphi(a) \ll' d^* \lor \varphi(b)) \right) \);

(S2) For all \( b \in B' \), \( b \ll' 1 \) implies \( \varphi(b) \ll 1 \).

Let the composition of two \( \text{MVDSkeLC} \)-morphisms be the usual composition of functions.

It is easy to see that in such a way we have defined a category.

Theorem 2.2 The categories \( \text{DSkeLC} \) and \( \text{MVDSkeLC} \) are isomorphic; hence the categories \( \text{SkeLC} \) and \( \text{MVDSkeLC} \) are dually equivalent.

Proof. Let us define two covariant functors \( K : \text{DSkeLC} \rightarrow \text{MVDSkeLC} \) and \( \Theta : \text{MVDSkeLC} \rightarrow \text{DSkeLC} \).

For every \((B, \rho, B) \in |\text{DSkeLC}|\) we put \( K(B, \rho, B) = \kappa(B, \rho, B) \) (see 1.8 for \( \kappa \)). Then Theorem 1.8 implies that \( K \) is well-defined on the objects of the category \( \text{DSkeLC} \).

Let \( \varphi \in \text{DSkeLC}((B, \rho, B), (B', \rho', B')) \). We will prove that the same function \( \varphi : B \rightarrow B' \) is an \( \text{MVDSkeLC} \)-morphism between \( K(B, \rho, B) \) and \( K(B', \rho', B') \). Since \( \varphi \) is a complete Boolean homomorphism between Boolean algebras \( B \) and \( B' \), we need only to check that \( \varphi \) satisfies axioms (S1) and (S2). Using 1.8 and (L1'), this can be easily done. So, we can define:

\[
K(\varphi) = \varphi.
\]

Then, obviously, \( K : \text{DSkeLC} \rightarrow \text{MVDSkeLC} \) is a (covariant) functor.

Let \((B, \leq, \ll) \in |\text{MVDSkeLC}|\). We put \( \Theta(B, \leq, \ll) = \theta(B, \leq, \ll) \) (see 1.8 for \( \theta \)). Then 1.8 implies that \( \Theta \) is well-defined on the objects of the category \( \text{MVDSkeLC} \).

Let \( \varphi \in \text{MVDSkeLC}((B, \leq, \ll), (B', \leq', \ll')) \). We will show that the same function \( \varphi : B \rightarrow B' \) is an \( \text{DSkeLC} \)-morphism between \( \Theta(B, \leq, \ll) \) and \( \Theta(B', \leq', \ll') \). For doing this it is enough to prove that \( \varphi \) satisfies conditions (L1) and (L2). Using 1.8 and (L1'), this can be easily done. So, we can define:

\[
\Theta(\varphi) = \varphi.
\]

Then, obviously, \( \Theta : \text{MVDSkeLC} \rightarrow \text{DSkeLC} \) is a (covariant) functor.

From the definition of the functors \( K \) and \( \Theta \) and the equalities \( \kappa \circ \theta = id \), \( \theta \circ \kappa = id \) (see 1.8), we conclude that \( K \circ \Theta = Id_{\text{MVDSkeLC}} \) and \( \Theta \circ K = Id_{\text{DSkeLC}} \). Hence, the categories \( \text{DSkeLC} \) and \( \text{MVDSkeLC} \) are isomorphic. \( \square \)
In [5] a category DSkePerLC was introduced, namely, the objects of the category DSkePerLC are all complete local contact algebras (see 1.4) and its morphisms \( \varphi : (A, \rho, B) \rightarrow (B, \eta, B') \) are all DSkeLC-morphisms satisfying the following condition:

(L3) \( a \in B \) implies \( \varphi(a) \in B' \).

Obviously, DSkePerLC is a subcategory of the category DSkeLC.

As it was proved in [5], the category DSkePerLC is dually equivalent to the category SkePerLC of all locally compact Hausdorff spaces and all skeletal perfect maps between them.

Note that, by 1.10(b), the morphisms of the category SkePerLC are precisely the quasi-open perfect maps (because the perfect maps are closed maps).

**Definition 2.3** Let's define a category which will be denoted by MVDSkePerLC. Its objects are all complete MVD-algebras (see 1.6). If \((B, \leq, \ll)\) and \((B', \leq', \ll')\) are two complete MVD-algebras then \( \varphi : (B, \leq, \ll) \rightarrow (B', \leq', \ll') \) will be an MVDSkePerLC-morphism iff \( \varphi : (B, \leq) \rightarrow (B', \leq') \) is a complete Boolean homomorphism satisfying the axiom (S2) from 2.1 and the following two additional axioms:

(ES1) For every \( a, b \in B \), \( a \ll b \) implies \( \varphi(a) \ll' \varphi(b) \);
(S3) For all \( a \in B \), \( a \ll 1 \) implies \( \varphi(a) \ll' 1 \).

Let the composition of two MVDSkePerLC-morphisms be the usual composition of functions.

It is easy to see that in such a way we have defined a (non-full) subcategory of the category MVDSkeLC.

**Theorem 2.4** The categories DSkePerLC and MVDSkePerLC are isomorphic; hence the categories SkePerLC and MVDSkePerLC are dually equivalent.

**Proof.** We will show that the restrictions \( K_p : DSkePerLC \rightarrow MVDSkePerLC \) and \( \Theta_p : MVDSkePerLC \rightarrow DSkePerLC \) of the functors \( K : DSkeLC \rightarrow MVDSkeLC \) and \( \Theta : MVDSkeLC \rightarrow DSkeLC \) defined in the proof of Theorem 2.2 are the desired isomorphism functors.

Let \( \varphi \in DSkePerLC((B, \rho, B), (B', \rho', B')) \). Then, as it was shown in the proof of 2.2, the same function \( \varphi : B \rightarrow B' \) is an MVDSkeLC-morphism between MVD-algebras \( K(B, \rho, B) \) and \( K(B', \rho', B') \). So, we need only to check that \( \varphi \) satisfies axioms (ES1) and (S3).

Put \( K_p(B, \rho, B) = (B, \leq, \ll) \) and \( K_p(B', \rho', B') = (B', \leq', \ll') \). Then, by 1.8, \( a \ll b \) iff \( a \in B \) and \( a \ll_p b \); also \( a \ll' b \) iff \( a \in B' \) and \( a \ll_{p'} b \). Using (L3), we get easily that (S3) is fulfilled. We will show that (ES1) takes place. Let \( a, b \in B \) and \( a \ll b \). Then \( a \ll_p b \) and \( a \in B \). Thus, by (L1'), \( \varphi(a) \ll_{p'} \varphi(b) \). Since, by (L3), \( \varphi(a) \in B' \), we obtain that \( \varphi(a) \ll' \varphi(b) \). We have established that \( \varphi \in MVDSkePerLC(K_p(B, \rho, B), K_p(B', \rho', B')) \).
Let \( \varphi \in \text{MVDSkePerLC}(B, \leq, \ll, (B', \leq', \ll')) \). We will show that \( \varphi \) satisfies condition (S1). Let \( a, b \in B \) and let, for every \( c \in B \) with \( c \ll 1 \), \( c \land a \ll c^* \lor b \) holds. Take \( d \in B' \) with \( d \ll 1 \). Then, by (S2), \( c = \varphi_A(d) \ll 1 \). Hence \( c \land a \ll c^* \lor b \).

Using (ES1), we obtain that \( \varphi(c) \land \varphi(a) \ll' (\varphi(c))^* \lor \varphi(b) \). Then (A1) and (\( \ll' \)) imply that \( d \land \varphi(a) \ll' d^* \lor \varphi(b) \). Hence (S1) is established. Now, as it was shown in the proof of 2.2, the same function \( \varphi : B \rightarrow B' \) is an \( \text{DSkeLC} \)-morphism between \( \Theta(B, \leq, \ll) \) and \( \Theta(B', \leq', \ll') \). So, we need only to prove that \( \varphi \) satisfies condition (L3). This can be done readily, using (S3). The rest follows from Theorem 2.2. \( \square \)

In [5] a category \( \text{DOpLC} \) was introduced, namely, the objects of the category \( \text{DOpLC} \) are all complete local contact algebras (see 1.4) and its morphisms \( \varphi : (A, \rho, \mathbb{B}) \rightarrow (B, \eta, \mathbb{B}') \) are all \( \text{DSkeLC} \)-morphisms satisfying the following condition:

\[ \text{(LO) } \forall a \in A \text{ and } \forall b \in \mathbb{B}', \varphi_A(b)\rho a \text{ implies } b\eta \varphi(a). \]

Obviously, \( \text{DOpLC} \) is a (non-full) subcategory of the category \( \text{DSkeLC} \).

As it was proved in [5], the category \( \text{OpLC} \) of all locally compact Hausdorff spaces and all open maps between them and the category \( \text{DOpLC} \) are dually equivalent.

**Definition 2.5** Let us define a category which will be denoted by \( \text{MVDOpLC} \). Its objects are all complete MVD-algebras. If \( (B, \leq, \ll) \) and \( (B', \leq', \ll') \) are two complete MVD-algebras then \( \varphi : (B, \leq, \ll) \rightarrow (B', \leq', \ll') \) will be an \( \text{MVDOpLC} \)-morphism iff \( \varphi \) is an \( \text{MVDSkeLC} \)-morphism (see 2.1) which satisfies the following axiom:

\[ \text{(SO) For all } a \in B \text{ and } b \in B', b \ll' \varphi(a) \text{ implies } \varphi_A(b) \ll a \text{ (see 1.1 for } \varphi_A) . \]

Let the composition of two \( \text{MVDOpLC} \)-morphisms be the usual composition of functions. It is easy to see that in such a way we have defined a category.

**Theorem 2.6** The categories \( \text{DOpLC} \) and \( \text{MVDOpLC} \) are isomorphic; hence the categories \( \text{OpLC} \) and \( \text{MVDOpLC} \) are dually equivalent.

**Proof.** We will show that the restrictions \( K_o : \text{DOpLC} \rightarrow \text{MVDOpLC} \) and \( \Theta_o : \text{MVDOpLC} \rightarrow \text{DOpLC} \) of the functors \( K \) and \( \Theta \) defined in the proof of Theorem 2.2 are the desired isomorphism functors.

Let \( \varphi \in \text{DOpLC}((B, \rho, \mathbb{B}), (B', \rho', \mathbb{B}')) \). We will prove that the same function \( \varphi : B \rightarrow B' \) is an \( \text{MVDOpLC} \)-morphism between \( K_o(B, \rho, \mathbb{B}) \) and \( K_o(B', \rho', \mathbb{B}') \). Since \( \varphi \) is an \( \text{MVDSkeLC} \)-morphism (see the proof of Theorem 2.2), we need only to check that \( \varphi \) satisfies the axiom (SO).

Put \( K(B, \rho, \mathbb{B}) = (B, \leq, \ll) \) and \( K(B', \rho', \mathbb{B}') = (B', \leq', \ll') \). Then, by 1.8, \( a \ll b \text{ iff } a \in \mathbb{B} \text{ and } a \ll \rho b; \text{ also } a \ll' b \text{ iff } a \in \mathbb{B}' \text{ and } a \ll' \rho b \).

For verifying (SO), note first that (LO) can be formulated equivalently as:

\[ \forall a \in A \text{ and } \forall b \in \mathbb{B}', b \ll' \varphi(a) \text{ implies } \varphi_A(b) \ll \rho a . \]
Let now $a \in B$, $b \in B'$ and $b \ll' \varphi(a)$. Then $b \ll_{\rho'} \varphi(a)$ and $b \in B'$. Hence, by (LO), $\varphi_{\Lambda}(b) \ll_{\rho} a$. Since, by (I.2), $\varphi_{\Lambda}(b) \in B$, we obtain that $\varphi_{\Lambda}(b) \ll a$.

Therefore, the functor $K_{\theta}$ is well-defined.

Let $\varphi \in \text{MVDOPoLC}((B, \leq, \ll), (B', \leq', \ll'))$. We will show that the same function $\varphi : B \to B'$ is a DOPoLC-morphism between $\Theta_{\theta}(B, \leq, \ll)$ and $\Theta_{\theta}(B', \leq', \ll')$. Since, by the proof of Theorem 2.2, $\varphi$ is an DSkEoLC-morphism, it is enough to show that $\varphi$ satisfies condition (LO).

Put $\Theta(B, \leq, \ll) = (B, \rho, B)$ and $\Theta(B', \leq', \ll') = (B', \rho', B')$.

Let $a \in B$, $b \in B'$ and $b \ll_{\rho} \varphi(a)$. Then, by Theorem (1.8), $b \ll' \varphi(a)$. Hence, by (SO), $\varphi_{\Lambda}(b) \ll a$. This implies that $\varphi_{\Lambda}(b) \ll_{\rho} a$. Hence, $\varphi$ satisfies condition (LO). So, $\Theta_{\theta}$ is well-defined.

The rest follows from Theorem 2.2. $\Box$

In [5], a category DOPoPerLC was introduced, namely, the objects of the category DOPoPerLC are all complete local contact algebras (see 1.4) and its morphisms $\varphi : (A, \rho, B) \to (B, \eta, B')$ are all DSkEoPerLC-morphisms satisfying the following condition:

Clearly, DOPoPerLC is a subcategory of the category DskEoPerLC.

As it was proved in [5], the category OpPerLC all locally compact Hausdorff spaces and all open perfect maps between them and the category DOPoPerLC are dually equivalent.

Definition 2.7 Let us now define a subcategory MVDOPOPerLC of the category MVDSkePerLC. Its objects are all complete MVD-algebras. If $(B, \leq, \ll)$ and $(B', \leq', \ll')$ are two complete MVD-algebras then a MVDSkePerLC-morphism $\varphi : (B, \leq, \ll) \to (B', \leq', \ll')$ (see 2.3) will be a MVDOPOPerLC-morphism if it satisfies the axiom (SO) (see 2.5).

It is easy to see that in such a way we have defined a category.

Theorem 2.8 The categories DOPoPerLC and MVDOPOPerLC are isomorphic; hence the categories OpPerLC and MVDOPOPerLC are dually equivalent.

Proof. It follows from the proofs of Theorem 2.4 and Theorem 2.6. $\Box$

In [7], a category DINsKEoLC was introduced, namely, the objects of the category DINsKEoLC are all complete local contact algebras (see 1.4) and, for any two CLCA’s $(A, \rho, B)$ and $(B, \eta, B')$, $\varphi : (A, \rho, B) \to (B, \eta, B')$ is an DINsKEoLC-morphism iff $\varphi$ is an DSKEoLC-morphism which satisfies the following condition:

$$(\text{LS}) \forall a, b \in B', \varphi_{\Lambda}(a) \rho \varphi_{\Lambda}(b) \text{ implies } a \eta b \text{ (see 1.1 for } \varphi_{\Lambda}).$$

As it was shown in [7], the category DINsKEoLC is dually equivalent to the category InSkEoLC.

Note that condition (LS) is equivalent to the condition below:

$$(\text{LS'}) \forall a, b \in B', a \ll_{\eta} b \text{ implies } \varphi_{\Lambda}(a) \ll_{\rho} (\varphi_{\Lambda}(b^*))^*.$$
Definition 2.9 Let $\text{MVDInSkeLC}$ be the category having as objects all complete $\text{MVD}$-algebras and let for any two complete $\text{MVD}$-algebras $(B, \leq, \ll)$ and $(B', \leq', \ll')$, $\varphi : (B, \leq, \ll) \rightarrow (B', \leq', \ll')$ be an $\text{MVDInSkeLC}$-morphism iff $\varphi$ is an $\text{MVDInSkeLC}$-morphism (see 2.1) which satisfies the following condition:

$$(LS'') \forall a, b \in B' \text{ such that } a, b \ll' 1, a \ll' b \text{ implies } \varphi_\Lambda(a) \ll (\varphi_\Lambda(b^*))^*.$$ 

Theorem 2.10 The categories $\text{DInSkeLC}$ and $\text{MVDInSkeLC}$ are isomorphic; hence the categories $\text{InSkeLC}$ and $\text{MVDInSkeLC}$ are dually equivalent.

Proof. We will show that the restrictions $K_r : \text{DInSkeLC} \rightarrow \text{MVDInSkeLC}$ and $\Theta_r : \text{MVDInSkeLC} \rightarrow \text{DInSkeLC}$ of the functors $K : \text{DSkeLC} \rightarrow \text{MVDSkeLC}$ and $\Theta : \text{MVDSkeLC} \rightarrow \text{DSkeLC}$ defined in the proof of Theorem 2.2 are the desired isomorphism functors.

Let $\varphi \in \text{DInSkeLC}((B, \rho, \mathcal{B}), (B', \rho', \mathcal{B}'))$. We will show that $\varphi : (B, \leq, \ll) \rightarrow (B', \leq', \ll')$ is an $\text{MVDInSkeLC}$-morphism between $\text{MVD}$-algebras $K(B, \rho, \mathcal{B})$ and $K(B', \rho', \mathcal{B}')$. We need only to check that $\varphi$ satisfies $(LS'')$. Let $a, b \in B'$, $a, b \ll' 1$ and $a \ll' b$. Then by 1.8, $a, b \in \mathcal{B}'$ and $a \ll b$. Since $\varphi$ satisfy $(LS')$, $\varphi_\Lambda(a) \ll (\varphi_\Lambda(b^*))^*$. It follows from (S2), that $\varphi_\Lambda(a) \ll 1$, i.e. $\varphi_\Lambda(a) \ll (\varphi_\Lambda(b^*))^*$. Hence $\varphi$ is an $\text{MVDInSkeLC}$-morphism.

Let $\varphi \in \text{MVDInSkeLC}((B, \leq, \ll), (B', \leq', \ll))$. We will show that the same function $\varphi : (B, \leq, \ll) \rightarrow (B', \leq', \ll)$ is a $\text{DInSkeLC}$-morphism between $\Theta(B, \leq, \ll)$ and $\Theta(B', \leq', \ll)$. Since, by 2.2, we have that $\varphi$ is an $\text{DSkeLC}$-morphism, we have only to show that $\varphi$ satisfies $(LS')$. Let $a, b \in \mathcal{B}'$ and $a \ll b$. By, 1.8 $a, b \ll' 1$ and $a \ll b$. Since $\varphi$ satisfies $(LS'')$, we get that $\varphi_\Lambda(a) \ll (\varphi_\Lambda(b^*))^*$, i.e. $\varphi_\Lambda(a) \in \mathcal{B}$ and $\varphi_\Lambda(a) \ll (\varphi_\Lambda(b^*))^*$. Then $\varphi$ satisfy $(LS')$. Thus $\varphi$ is a $\text{DInSkeLC}$-morphism. $\square$

In [7], a category $\text{DSuSkeLC}$ was introduced, namely, the objects of the category $\text{DSuSkeLC}$ are all complete local contact algebras (see 1.4) and its morphisms $\varphi : (A, \rho, \mathcal{B}) \rightarrow (B, \eta, \mathcal{B}')$, where $(A, \rho, \mathcal{B})$ and $(B, \eta, \mathcal{B}')$ are CLCA’s, are all $\text{DSkeLC}$-morphism which satisfy the following condition:

(IS) For every bounded ultrafilter $u$ in $(A, \rho, \mathcal{B})$ there exists a bounded ultrafilter $v$ in $(B, \eta, \mathcal{B}')$ such that $\varphi_\Lambda(v)ru$ (see 1.11, 1.1 and 1.3 for the notations).

As it was proved in [7], the categories $\text{SuSkeLC}$ and $\text{DSuSkeLC}$ are dually equivalent.

Definition 2.11 Let’s define a category which will be denoted by $\text{MVDSuSkeLC}$. Its objects are all complete $\text{MVD}$-algebras. If $(B, \leq, \ll)$ and $(B', \leq', \ll')$ are two complete $\text{MVD}$-algebras then $\varphi \in \text{MVDSuSkeLC}((B, \leq, \ll), (B', \leq', \ll'))$ iff $\varphi$ is an $\text{MVDSkeLC}$-morphism (see 2.1) which satisfies the following axiom:

(IS') For every ultrafilter $u$ in $(B, \leq, \ll)$ such that $\exists c \in u, c \ll 1$, there exists a ultrafilter $v$ in $(B', \leq', \ll')$ such that $\exists c' \in v, c' \ll' 1$, and $\forall a \in u$ and $\forall b \in v$ there exists a $c''_{ab} \in B$ such that $c''_{ab} \ll 1$ and $\varphi_\Lambda(b) \wedge c''_{ab} \ll (a \wedge c''_{ab})^*$. 

11
Theorem 2.12 The categories DSuSkeLC and MVDSuSkeLC are isomorphic; hence the categories SuSkeLC and MVDSuSkeLC are dually equivalent.

Proof. We will show that the restrictions $K_q: DSuSkeLC \to MVDSuSkeLC$ and $\Theta_q: MVDSuSkeLC \to DSuSkeLC$ of the functors $K: DSkeLC \to MVDSkeLC$ and $\Theta: MVDSkeLC \to DSkeLC$ defined in the proof of Theorem 2.2 are the desired isomorphism functors.

Let $\varphi \in DSuSkeLC(((B, \rho, B), (B', \rho', B'))$. Since $\varphi$ is an MVDSkeLC-morphism (see the proof of Theorem 2.2), we need only to check that $\varphi$ satisfies the axiom $(IS')$. Let $u$ be an ultrafilter in $(B, \leq, \ll)$ such that $\exists c \in u$, $c \ll 1$. Then, by 1.8, $c \in B$ and hence $u$ is a bounded ultrafilter in $(B, \rho, B)$. Since $\varphi$ satisfies (IS), there exists a bounded ultrafilter $v$ in $(B', \rho', B')$, such that $\varphi(v)ru$, i.e. $\exists c' \in v$, such that $c' \ll' 1$ and $\forall a \in u$ and $\forall b \in v$ there exists a $c''_{ab} \in B$ such that $c''_{ab} \ll 1$ and $\varphi_A(b) \land c''_{ab} \not\ll (a \land c''_{ab})^*$. Hence, $\varphi$ is an MVDSuSkeLC-morphism.

Let $\varphi \in MVDSuSkeLC(((B, \leq, \ll), (B', \leq', \ll))$. We will show that the same function $\varphi: B \to B'$ is a DSuSkeLC-morphism between $\Theta_q(B, \leq, \ll)$ and $\Theta_q(B', \leq', \ll)$. We have by 2.2 that $\varphi$ is an DSkeLC-morphism. We need to check only that $\varphi$ satisfies $(IS)$. Let $u$ be a bounded ultrafilter in $(B, \rho, B)$. Then, by 1.8, $\exists c \in u$, $c \ll 1$. Since $\varphi$ satisfies $(IS')$, there exists an ultrafilter $v$ in $(B', \leq', \ll')$ such that $\exists c' \in v$, $c' \ll' 1$ and $\forall a \in u$ and $\forall b \in v$ there exists a $c''_{ab} \in B$ such that $c''_{ab} \ll 1$ and $\varphi_A(b) \land c''_{ab} \not\ll (a \land c''_{ab})^*$. Hence $v$ is a bounded ultrafilter in $(B', \rho', B')$ and $\varphi_A(v)ru$. Thus $\varphi$ is a DSuSkeLC-morphism.

In [7], a category DSuSkePerLC is introduced, namely, the objects of the category DSuSkePerLC are all CLCA’s (see 1.4) and its morphisms are all injective complete MVD-homomorphisms $\varphi: (A, \rho, B) \to (B, \eta, B')$ satisfying axioms (L1)-(L3).

In [7], a category DInSkePerLC is introduced, namely, the objects of the category DInSkePerLC are all CLC-algebras (see 1.4) and its morphisms are all DSkePerLC-morphisms $\varphi: (A, \rho, B) \to (B, \eta, B')$ which satisfy condition (LS);

As it was proved in [7], the categories SuSkePerLC and DSuSkePerLC are dually equivalent. Also, in [7] it was proved that the categories InSkePerLC and DInSkePerLC are dually equivalent.

Definition 2.13 Let MVDSkePerLC be the category of all complete MVD-algebras and if $(B, \leq, \ll)$ and $(B', \leq', \ll')$ are two complete MVD-algebras then $\varphi: (B, \leq, \ll) \to (B', \leq', \ll')$ will be an MVDSkePerLC-morphism iff $\varphi$ is an MVDSkePerLC-morphism (see 2.3) which satisfies the following axiom:

(CS) $\forall a, b \in B'$, $a \ll' b$ implies $\varphi_A(a) \ll (\varphi_A(b'))^*$.

Definition 2.14 We will denote by MVSuSkePerLC the category of all complete MVD-algebras and all injective complete MVD-homomorphisms between them satisfying axioms (ES1), (S2) and (S3) (see 2.1 and 2.3).
Theorem 2.15 (i) The categories $\text{DSuSkePerLC}$ and $\text{MVDSuSkePerLC}$ are isomorphic; hence the categories $\text{SuSkePerLC}$ and $\text{MVDSuSkePerLC}$ are dually equivalent.

(ii) The categories $\text{DInSkePerLC}$ and $\text{MVDSInSkePerLC}$ are isomorphic; hence the categories $\text{InSkePerLC}$ and $\text{MVDSInSkePerLC}$ are dually equivalent.

Proof. (i) It follows immediately from Theorem 2.4.

(ii) Let $\varphi \in \text{DInSkePerLC}((B, \rho, \mathbb{B}), (B', \rho', \mathbb{B}'))$. We will prove that the same function $\varphi : B \rightarrow B'$ is an $\text{MVDSInSkePerLC}$-morphism between $K(B, \rho, \mathbb{B})$ and $K(B', \rho', \mathbb{B}')$ (see the proof of 2.2 for $K$). In Theorem 2.4 we have seen that $\varphi$ is an $\text{MVDSkePerLC}$-morphism. Thus we need only to show that $\varphi$ satisfies condition (CS) of 2.13. Put $K(B, \rho, \mathbb{B}) = (B, \leq, \ll)$ and $K(B', \rho', \mathbb{B}') = (B', \leq', \ll')$ (see 2.4 and 1.8 for the corresponding definitions). Let $a, b \in B'$ and $a \ll' b$. Then, by (1), $a(-\rho)b^*$. Hence, by (LS), $\varphi_L(a)(-\rho)\varphi_L(b^*)$, i.e. $\varphi_L(a) \ll (\varphi_L(b^*))^\ast$. Since, by (S2), $\varphi_L(a) \ll 1$ (because $a \ll' 1$), we obtain, using twice (1), that $\varphi_L(a) \in \mathbb{B}$ and $\varphi_L(a) \ll (\varphi_L(b^*))^\ast$. So, $\varphi$ is an $\text{MVDSkePerLC}$-morphism.

Let $\varphi \in \text{MVDSkePerLC}((B, \leq, \ll), (B', \leq', \ll'))$. We will show that the same function $\varphi : B \rightarrow B'$ is an $\text{DInSkePerLC}$-morphism between $\Theta(B, \leq, \ll)$ and $\Theta(B', \leq', \ll')$ (see the proof of 2.2 for $\Theta$). For doing this it is enough (by Theorem 2.4) to prove that $\varphi$ satisfies condition (LS). We will show that $\varphi$ satisfies condition (LS') which, as we know, is equivalent to condition (LS).

Put $\Theta(B, \leq, \ll) = (B, \rho, \mathbb{B})$ and $\Theta(B', \leq', \ll') = (B', \rho', \mathbb{B}')$.

Let $a, b \in B'$ and $a \ll' b$. Then, using 1.8, (S3), (1.2) and (CS), we obtain that $(a \ll_{\rho'} b) \rightarrow (\forall c \in B$ such that $c \ll 1, \varphi(c) \land a \ll' \varphi(c^*) \lor b) \rightarrow (\forall c \in B$ such that $c \ll 1, \varphi_L(\varphi(c) \land a) \ll (\varphi_L((\varphi(c^*) \lor b^*))^\ast) \leftrightarrow (\forall c \in B$ such that $c \ll 1, c \land \varphi_L(a) \ll (c \land \varphi(c^*) \lor b^*))^\ast) \leftrightarrow (\forall c \in B$ such that $c \ll 1, c \land \varphi_L(a) \ll (c \land \varphi_L(b^*))^\ast) \leftrightarrow (\varphi_L(a) \ll (\varphi_L(b^*))^\ast)$.

Therefore, $\varphi$ satisfies condition (LS). The rest follows from Theorem 2.4. \qed

In [7], a category $\text{DSuOpPerLC}$ was introduced, namely, the objects of the category $\text{DSuOpPerLC}$ are all CLCA’s and its morphisms are all injective complete Boolean homomorphisms between them satisfying axioms (L1)-(L3) and (LO). Also, in [7], a category $\text{DInOpPerLC}$ was introduced, namely, the objects of the category $\text{DInOpPerLC}$ are all CLCA’s and its morphisms are all surjective complete Boolean homomorphisms between them satisfying axioms (L1)-(L3) and (LO). As it was proved in [7], the categories $\text{DSuOpPerLC}$ and $\text{DInOpPerLC}$ are dually equivalent to the categories $\text{SuOpPerLC}$ and $\text{InOpPerLC}$, respectively.

Notation 2.16 We will denote by:
• $\text{MVDSuOpPerLC}$ the category of all complete MVD-algebras and all injective complete Boolean homomorphisms between them satisfying axioms (ES1), (S2), (S3) and (SO) (see 2.1, 2.3 and 2.5).
• **MVDInOpPerLC** the category of all complete MVD-algebras and all surjective complete Boolean homomorphisms between them satisfying axioms (ES1), (S2), (S3) and (SO) (see 2.1, 2.3 and 2.5).

**Theorem 2.17** (i) The categories **DSuOpPerLC** and **MVDSuOpPerLC** are isomorphic; hence the categories **SuOpPerLC** and **MVDSuOpPerLC** are dually equivalent.

(ii) The categories **DInOpPerLC** and **MVDInOpPerLC** are isomorphic; hence the categories **InOpPerLC** and **MVDInOpPerLC** are dually equivalent.

**Proof.** It follows immediately from Theorems 2.8 and 2.15.

In [7], a category **DSuOpLC** was introduced, namely, the objects of the category **DSuOpLC** are all CLCA’s and its morphisms are all complete Boolean homomorphisms between them satisfying axioms (L1), (L2), (IS) and (LO); Also, in [7], a category **DInOpLC** was introduced, namely, the objects of the category **DInOpLC** are all CLCA’s and its morphisms are all surjective complete Boolean homomorphisms between them satisfying axioms (L1), (L2) and (LO).

As it was proved in [7], the categories **InOpLC** and **DInOpLC** are dually equivalent; also, the categories **SuOpLC** and **DSuOpLC** are dually equivalent.

**Notation 2.18** We will denote by:

• **MVDSuOpLC** the category of all complete *MVD*-algebras and all complete Boolean homomorphisms between them satisfying the axioms (S1), (S2), (IS′) and (SO) (see 2.1, 2.11 and 2.5).

• **MVDInOpLC** the category of all complete *MVD*-algebras and all surjective complete Boolean homomorphisms between them satisfying the axioms (S1), (S2) (SO) (see 2.1 and 2.5).

The next theorem follows immediately from Theorem 2.2, Theorem 2.6 and Theorem 2.12:

**Theorem 2.19** The categories **DSuOpLC** and **MVDSuOpLC** are isomorphic; hence the categories **SuOpLC** and **MVDSuOpLC** are dually equivalent.

The next theorem follows immediately from Theorem 2.2 and Theorem 2.6:

**Theorem 2.20** The categories **DInOpLC** and **MVDInOpLC** are isomorphic; hence the categories **InOpLC** and **MVDInOpLC** are dually equivalent.

**Definition 2.21** An MVD-algebra *(B, ≤, ≪)* is called connected if it satisfies the following axiom:

(CONA) If *a ≠ 0, 1* then there exists *c ≪ 1* such that *c ∧ a ≪ a ∨ c*. 

**Fact 2.22** Let *(L, τ)* be a locally compact Hausdorff space. Then the standard MVD-algebra *(RC(L), ⊆, ≪_L)* is connected iff the space *(L, τ)* is connected.
Proof. Let's note that $\forall F, G \in RC(L), F \ll_L G$ iff $F \in CR(L)$ and $F \ll_{\rho_L} G$. Hence $k(\text{RC}(L), \rho_L, \text{CR}(L)) = (\text{RC}(L), \subseteq, \ll_L)$. Let $(L, \tau)$ be connected. Then, from 1.9, it follows that $(\text{RC}(L), \rho_L)$ is connected. Let $a \in \text{RC}(L), a \neq 0, 1$. Then, from (CON), $a \rho_L a^*$. It follows from 1.8 that there exists $c \ll_L 1$ such that $c \wedge a \not\ll_L a \lor c^*$, i.e. $(\text{RC}(L), \subseteq, \ll_L)$ is connected.

Let now $(\text{RC}(L), \subseteq, \ll_L)$ be connected. Then for every $a \in \text{RC}(L)$ such that $a \neq 0, 1$, there exists an $c \ll_L 1$ such that $c \wedge a \not\ll_L a \lor c^*$. It follows from 1.8 that $a \rho_L a^*$. Hence $(\text{RC}(L), \rho_L)$ is connected. Then, it follows from 1.9 that $(L, \tau)$ is connected. □

Notation 2.23 We will denote by:
- $\text{MVDSkePerLCCon}$ the category of all connected complete MVD-algebras and all complete Boolean homomorphisms between them satisfying axioms (ES1), (S2), (S3) (see 2.3).
- $\text{MVDOpPerLCCon}$ the category of all connected complete MVD-algebras and all complete Boolean homomorphisms between them satisfying axioms (ES1), (S2), (S3) and (SO) (see 2.1, 2.3 and 2.5).

The next theorem follows immediately from 1.9, 2.22 and 2.4:

Theorem 2.24 The categories $\text{DSkePerLCCon}$ and $\text{MVDSkePerLCCon}$ are isomorphic; hence the categories $\text{SkePerLCCon}$ and $\text{MVDSkePerLCCon}$ are dually equivalent.

The next theorem follows immediately from 1.9, 2.22 and 2.8:

Theorem 2.25 The categories $\text{DOpPerLCCon}$ and $\text{MVDOpPerLCCon}$ are isomorphic; hence the categories $\text{OpPerLCCon}$ and $\text{MVDOpPerLCCon}$ are dually equivalent.

Analogously one can formulate and prove the connected versions of Theorems 2.2 and 2.6.

In [6], a category $\text{DHLHC}$ was introduced, namely, the objects of the category $\text{DHLHC}$ are all complete LC-algebras and its morphisms are all functions $\psi : (A, \rho, \mathbb{B}) \rightarrow (B, \eta, \mathbb{B}')$ between the objects of $\text{DHLHC}$ satisfying the conditions

\begin{itemize}
  \item[(DLC1)] $\psi(0) = 0$.
  \item[(DLC2)] $\psi(a \wedge b) = \psi(a) \wedge \psi(b)$ for all $a, b \in A$.
  \item[(DLC3)] If $a \in \mathbb{B}, b \in A$ and $a \ll_{\rho} b$, then $\psi(a^*) \ll_{\eta} \psi(b)$.
  \item[(DLC4)] For every $b \in \mathbb{B}'$ there exists $a \in \mathbb{B}$ such that $b \leq \psi(a)$.
  \item[(DLC5)] $\psi(a) = \bigvee \{\psi(b) \mid b \in \mathbb{B}, b \ll_{\rho} a\}$, for every $a \in A$.
\end{itemize}

Let the composition “$\circ$” of two morphisms $\psi_1 : (A_1, \rho_1, \mathbb{B}_1) \rightarrow (A_2, \rho_2, \mathbb{B}_2)$ and $\psi_2 : (A_2, \rho_2, \mathbb{B}_2) \rightarrow (A_3, \rho_3, \mathbb{B}_3)$ of $\text{DHLHC}$ be defined by the formula

\begin{equation}
\psi_2 \circ \psi_1(a) = \bigvee \{\psi_2(\psi_1(b)) \mid b \in \mathbb{B}, b \ll_{\rho} a\},
\end{equation}
for every \( a \in A \).

As it was proved in [6], the category \( \text{DHLC} \) is dually equivalent to the category \( \text{HLC} \) of all locally compact Hausdorff spaces and all continuous mappings between them.

**Definition 2.26** Let \( \text{MVDHLC} \) be the category whose objects are all complete MVD-algebras and whose morphisms are all functions \( \psi : (A, \le, \ll) \rightarrow (B, \le', \ll') \) between the objects of \( \text{MVDHLC} \) satisfying the conditions

- (MVDLC1) \( \psi(0) = 0 \).
- (MVDLC2) \( \psi(a \wedge b) = \psi(a) \wedge \psi(b) \) for all \( a, b \in A \).
- (MVDLC3) If \( a, b \in A \) and \( a \ll b \), then \( \forall c \in B \) with \( c \ll' 1 \), \( (\psi(a^*))^* \wedge c \ll' \psi(b) \vee c^* \).
- (MVDLC4) For every \( b \in B \) with \( b \ll' 1 \) there exists \( a \in A \) with \( a \ll 1 \) such that \( b \le \psi(a) \).
- (MVDLC5) \( \psi(a) = \bigvee \{ \psi(b) \mid b \ll a \} \), for every \( a \in A \).

Let the composition “\( \circ \)” of two morphisms \( \psi_1 : (A_1, \le_1, \ll_1) \rightarrow (A_2, \le_2, \ll_2) \) and \( \psi_2 : (A_2, \le_2, \ll_2) \rightarrow (A_3, \le_3, \ll_3) \) of \( \text{MVDHLC} \) be defined by the formula

\[
(6) \quad \psi_2 \circ \psi_1(a) = \bigvee \{ \psi_2 \circ \psi_1(b) \mid b \ll_1 a \}, \forall a \in A_1.
\]

**Theorem 2.27** The categories \( \text{DHLC} \) and \( \text{MVDHLC} \) are isomorphic; hence the categories \( \text{MVDHLC} \) and \( \text{HLC} \) are dually equivalent.

**Proof.** Let us define two covariant functors \( P : \text{DHLC} \rightarrow \text{MVDHLC} \) and \( Q : \text{MVDHLC} \rightarrow \text{DHLC} \).

For every \( (B, \rho, B) \in |\text{DHLC}| \) we put \( P(B, \rho, B) = k(B, \rho, B) \) (see 1.8 for \( \kappa \)). Then Theorem 1.8 implies that \( P \) is well-defined on the objects of the category \( \text{DHLC} \).

Let \( \psi \in \text{DHLC}((B, \rho, B), (B', \rho', B')) \). We will prove that \( \psi \) is a \( \text{MVDHLC} \)-morphism between \( P(B, \rho, B) = (B, \le, \ll) \) and \( P(B', \rho', B') = (B', \le', \ll') \). It is obvious that \( \psi \) satisfies axioms (MVDLC1) and (MVDLC2). Let \( a \ll b \). Then \( a \in B \) and \( a \ll_b B \). It follows from (DLC3) that \( (\psi(a^*))^* \ll_{\rho'} \psi(b) \). Then, from 1.8 it follows that \( \forall \psi \ll' 1, (\psi(a^*))^* \wedge c \ll' \psi(b) \vee c^* \). Hence \( \psi \) satisfies (MVDLC3). Let \( b \ll' 1 \). From (DLC4) it follows that there exists an \( a \in B \) such that \( b \le \psi(a) \). Hence \( a \ll 1 \) and \( b \le \psi(a) \), i.e. \( \psi \) satisfies (MVDLC4).

Let \( a \in B \). Then \( \psi(a) = \bigvee \{ \psi(b) \mid b \ll_a B \} \). \( \forall a \in B_1 \), \( (\varphi_2 \circ \varphi_1)(a) = \bigvee \{ (\varphi_2 \circ \varphi_1)(b) \mid b \ll_1 a \} = \bigvee \{ (\varphi_2 \circ \psi_1)(b) \mid b \in B_1, b \ll_{\rho_1} a \} = (\varphi_2 \circ \psi_1)(a) = (P(\varphi_2 \circ \psi_1))(a) \). Since, obviously, \( P \) preserves the identities, we get that \( P : \text{DHLC} \rightarrow \text{MVDHLC} \) is a (covariant) functor.

Let \( (B, \le, \ll) \in |\text{MVDHLC}| \). We put \( Q(B, \le, \ll) = \theta(B, \le, \ll) \) (see 1.8 for \( \theta \)). Then Theorem 1.8 implies that \( Q \) is well-defined on the objects of the category \( \text{MVDHLC} \).
Let $\psi \in \text{MVDHLC}((B, \leq, \ll), (B', \leq', \ll'))$. We will prove that $\psi$ is a DHLC-morphism between $Q(B, \leq, \ll) = (B, \rho, \mathbb{B})$ and $Q(B', \leq', \ll') = (B', \rho', \mathbb{B}')$. It is obvious that $\psi$ satisfies axioms (DLC1) and (DLC2).

Let $a \in \mathbb{B}$, $b \in B$ and $a \ll \rho b$. Hence $a \ll b$. It follows from (MVDLC3) that $\forall c \ll 1, (\psi(a))^* \land c \ll \psi(b) \lor c^*$. By 1.8, we get that $\psi(a))^* \ll \rho' \psi(b)$. Then $\psi$ satisfies (DLC3).

Let $b \in \mathbb{B}'$. Then $b \ll' 1$. It follows from (MVDLC4) that $\exists a \ll 1$, such that $b \leq' \psi(a)$. Hence $a \in \mathbb{B}$ and $b \leq \psi(a)$. Then $\psi$ satisfies (DLC4).

Let $a \in B$. Then from (MVDLC5) we get that $\psi(a) = \bigvee \{\psi(b) \mid b \ll a\} = \bigvee \{\psi(b) \mid b \ll \rho a\}$. Therefore $\psi \in \text{DHLC}((B, \rho, \mathbb{B}), (B', \rho', \mathbb{B}'))$. So, we can define $Q(\psi) = \psi$.

Let $\varphi_i \in \text{MVDHLC}((B_i, \leq_i, \ll_i), (B_{i+1}, \leq_{i+1}, \ll_{i+1})), Q(\varphi_i) = \psi_i, i = 1, 2$. We have that $\forall a \in B_1, (\psi_2 \circ \psi_1)(a) = \bigvee \{(\psi_2 \circ \psi_1)(b) \mid b \ll \rho_i a\} = \bigvee \{\varphi_2 \circ \varphi_1\}(b) \mid b \ll_1 a\} = (\varphi_2 \circ \varphi_1)(a) = Q(\varphi_2 \circ \varphi_1)(a)$. Since, obviously, $Q$ preserves the identities, we get that $Q : \text{MVDHLC} \rightarrow \text{DHLC}$ is a (covariant) functor.

From the definition of the functors $P$ and $Q$ and the equalities $\kappa \circ \theta = \text{id}$, $\theta \circ \kappa = \text{id}$ (see 1.8), we conclude that $P \circ Q = \text{Id}_{\text{MVDHLC}}$ and $Q \circ P = \text{Id}_{\text{DHLC}}$. Hence, the categories $\text{DHLC}$ and $\text{MVDHLC}$ are isomorphic.
