1. Introduction

Consider the multiple solutions of fractional order impulsive systems as follows:

\[
\begin{aligned}
\frac{d}{dt} \left( D_t^\beta + \mathcal{I}_t^\alpha \right) u(t) &= a(t)u(t) + \nabla F(t, u(t)), \quad \text{for } t \neq t_j, \text{ a.e. } t \in [0, T], \\
\Delta (D_t^\alpha u)(t_j) &= I_j(u(t_j)), \quad t_j \in [0, T], j = 1, 2, \ldots, l, \\
u(0) &= u(T) = 0,
\end{aligned}
\]

where \( \beta \in (0, 1], \alpha = 1 - \beta/2 \in (1/2, 1] \); \( D_t^\beta, I_t^\alpha \) are the left and right Riemann-Liouville fractional integrals of order \( \beta \), \( D_t^{\beta, \alpha}, I_t^{\alpha, \beta} \) are used to denote the left and right Caputo fractional derivatives of order \( \alpha \), \( 0 = t_0 < t_1 < \cdots < t_l < t_{l+1} = T, a \in \mathbb{R}, F : [0, T] \times \mathbb{R} \rightarrow \mathbb{R} \) is a given function, \( \nabla F(t, x) \) is the gradient of \( F \) at \( x \), there are constants \( a_0, a_1 \) with \( 0 < a_0 \leq a(t) \leq a_1 \),

\[
(D_t^\alpha u)(t) = \frac{1}{2} \left( D_t^{\alpha-1}(\mathcal{I}_t^\beta u) - I_t^{\alpha-1}(\mathcal{I}_t^\beta u) \right)(t),
\]

\[
\Delta (D_t^\beta u)(t_j) = \frac{1}{2} \left( D_t^{\beta-1}(\mathcal{I}_t^\alpha u) - I_t^{\beta-1}(\mathcal{I}_t^\alpha u) \right)(t_j),
\]

for \( j = 1, 2, \ldots, l \).

The problem (1) arises from the phenomena of advection dispersion and was first scrutinized by Erwin and Roop in [1]. From then on, more and more scholars began to pay attention to the problem in [1] and the related problems.

Fractional calculus is different from integral calculus in nature. It has nonlocal characteristics and is very suitable for describing materials and processes with memory effect and genetic properties. Therefore, fractional differential equations are widely used in many domains, for instance,
biomedicine, economic mathematics, and technology science [2, 3]. In recent years, the variational methods and critical point theory have been widely used to study fractional differential equations [4–8].

In [8], the authors discussed the following fractional order differential systems:

\[
\begin{aligned}
&\frac{d}{dt} \left( \alpha D_t^\alpha u(t) + \beta D_t^\beta u(t) \right) = \nabla F(t, u(t)), \quad \text{a.e.} t \in [0, T], \\
&u(0) = u(T) = 0.
\end{aligned}
\]

(3)

They used the critical point theory and other tools to verify the existence of solutions. From then on, a number of scholars began to use such methods for research, as shown in [9–11].

In [12], the authors discussed the following problems:

\[
\begin{aligned}
&\alpha D_t^\alpha (a(t)\alpha D_t^\alpha u(x)) = \lambda u(t)\nabla F(t, u(t)), \quad \text{a.e.} t \in [0, T], \\
&u(0) = u(T) = 0.
\end{aligned}
\]

(4)

They proved that there are at least \( k \) pairs of weak solutions and two weak solutions by using the Clark Theorem and other methods.

An impulsive phenomenon is a common phenomenon in nature and engineering applications. The models reflected in mathematics are impulsive differential equations. The most prominent feature of impulsive differential equation is that it can fully consider the impact of instantaneous mutation on the state. Therefore, in recent decades, impulsive differential equation theory has been widely used in biological mathematics, theoretical mechanics, biomechanics, and economic mathematics (see [13–18]).

For the past few years, very few scholars used the variational method and critical point theory to discuss impulsive fractional differential equations and their boundary value problems. Moreover, few papers discuss the fractional order system by using Morse theory (see [19–24]).

In [23], the authors discussed the following problems:

\[
\begin{aligned}
&\alpha D_t^\alpha (\beta D_t^\beta u(t) + k(t)u(t)) = f(t, u(t)), \quad 0 < t < T, t \neq t_j, \\
&\Delta(\beta D_t^\beta u(t)) = I_j(u(t_j)), \quad j = 1, 2, \cdots, m, \\
&u(0) = u(T) = 0.
\end{aligned}
\]

(5)

The multiple solutions of this problem are verified with Morse theory and the Clark theorem by the authors.

In [25], the sufficient conditions for the existence of infinite solutions to the system (1) by using Morse theory, Clark theorem, and Brezis and Nirenberg’s Linking Theorem.

First of all, we give some assumptions.

\( (H1) I_j \in C([0, T], R), I_j(0) = 0, \) there exist some constants \( e_j, y_j \in [0, 1], a_j, b_j > 0, \) such that \( \lim_{|u| \to 0} (|I_j(u)|/|u|^\delta) = b_j, |I_j(u)| \leq a_j|u|^\delta, j = 1, \cdots, l, \) and \( \int_0^1 I_j(s)ds \geq 0, \) for \( \forall u \in R \)

\( (H2) F \in C([0, T], R) \) and \( F(t, 0) = 0, \) \( \lim_{|u| \to 0} \sup_{t \in [0, T]} (F(t, u)/|u|^\delta) < 1/2(\Gamma^2(\alpha + 1)/\cos(\pi\alpha)/T^{2\alpha} - a) \) uniformly on \( t \in [0, T] \)

\( (H3) \lim_{|u| \to 0} \sup_{t \in [0, T]} (|F(t, u)|/|u|^\delta) < \Gamma^2(\alpha + 1)/2T^{2\alpha} \) uniformly on \( t \in [0, T] \).

\( (H4) F(t, -u) = F(t, u) \) and \( I_j(-u) = -I_j(u) \) for \( u \in R \).

The key outcomes are as follows.

**Theorem 1.** Let \( (H1)–(H3) \) hold. Then, the problem (1) has at least three classical solutions.

**Theorem 2.** Let \( (H1)–(H4) \) hold. Then, the problem (1) has at least \( k \) distinct pairs of classical solutions.

Note that the methods in this article are distinct from [25] and our results are richer. The problems in this paper we studied are different from the problems in [23]. Compared with [23], classical solutions are investigated in this paper.

The structure of this article is as below. In Section 2, we provide some preliminary knowledge, which are helpful to the proof the key outcomes. We prove the key outcomes in Section 3. Finally, an example is given to illustrate the main results.

2. Preliminaries

Similar to [25], we first convert system (1) into a new format as follows:

\[
\begin{aligned}
\frac{d}{dt} \left( \frac{1}{2} \alpha D_t^\alpha (\beta D_t^\beta u(t)) - \frac{1}{2} \beta D_t^\alpha (\beta D_t^\beta u(t)) \right) + a(t)u(t) + \nabla F(t, u(t)) = 0, \quad t \neq t_j, \text{a.e.} t \in [0, T], \\
\Delta(D_t^\alpha u(t)) = I_j(u(t_j)), \quad t_j \in (0, T), j = 1, 2, \cdots, l, \\
u(0) = u(T) = 0.
\end{aligned}
\]

(6)
Lemma 5. We know that the solutions of system (6) are the solutions of system (1).

Remark 7. Obviously, from (10), we know that the critical points of functional \( \Phi \) are the weak solutions of system (6).

Definition 8 (see [25]). We define
\[
\begin{align*}
\Phi(u) & = \int_0^T \left( -\frac{1}{2} \| D_t^\alpha u(t) \|^2_{D_t^\beta} + \| D_t^\beta u(t) \|^2_{D_t^\alpha} - a(t) u(t) v(t) \right) dt \\
& \quad + \sum_{j=1}^I J_j(u(t_j)) v(t_j) - \int_0^T \nabla F(t, u(t), v(t)) dt = 0
\end{align*}
\]
for all \( v \in E_0^\alpha \).

We define \( \Phi : E_0^\alpha \rightarrow R \) as
\[
\begin{align*}
\Phi(u) & = \int_0^T \left( -\frac{1}{2} \| D_t^\alpha u(t) \|^2_{D_t^\beta} + \| D_t^\beta u(t) \|^2_{D_t^\alpha} - a(t) u(t) v(t) \right) dt \\
& \quad - \int_0^T \nabla F(t, u(t), v(t)) dt + \sum_{j=1}^I J_j(u(t_j)) v(t_j) \\
& \quad - \int_0^T \| D_t^\beta u(t) \|^2_{D_t^\alpha} dt.
\end{align*}
\]

From (H1), (H2), we know the functional \( \Phi \) is continuously differentiable. So for all \( u, v \in E_0^\alpha \), we have
\[
\begin{align*}
\langle \Phi'(u), v \rangle & = \int_0^T \left( -\frac{1}{2} \| D_t^\alpha u(t) \|^2_{D_t^\beta} + \| D_t^\beta u(t) \|^2_{D_t^\alpha} - a(t) u(t) v(t) \right) dt \\
& \quad - \int_0^T a(t) u(t) v(t) dt + \sum_{j=1}^I J_j(u(t_j)) v(t_j) \\
& \quad - \int_0^T \nabla F(t, u(t), v(t)) dt.
\end{align*}
\]
\[ \left( \int_0^T \| D^2 u(t) \|^2 dt \right)^{1/2}, \forall u \in E_0^n. \] Next, we will use \( \| u \|_a = \left( \int_0^T \| D^2 u(t) \|^2 dt \right)^{1/2} \) as the norm in \( E_0^n. \)

**Lemma 12** (see [8]). Let \( 1/2 < \alpha \leq 1, \forall u \in E_0^n, \) have

\[
| \cos(\pi \alpha) \| u \|_a^2 \leq \frac{1}{| \cos(\pi \alpha) \| u \|_a^2}, 
\]

\[ (16) \]

**Lemma 13** (see [8]). Let \( 1/2 < \alpha \leq 1. \) Assume the sequence \( \{ u_n \} \) converges weakly to \( u \) in \( E_0^n. \) Then, \( u_n \rightarrow u \) strongly in \( C([0, T], R), \) i.e., \( \| u_n - u \|_{C^0} \rightarrow 0, \) as \( n \rightarrow \infty. \)

**Definition 14** (see [23]). We say that \( \Phi \) satisfies the (PS) condition in \( E_0^n, \) if any \( \{ u_n \}_{n \in \mathbb{N}} \subset E_0^n, \) for which \( \{ \Phi(u_n) \}_{n \in \mathbb{N}} \) is bounded and \( \Phi'(u_n) \rightarrow 0 \) as \( n \rightarrow \infty \) owns a strongly convergent subsequence in \( E_0^n. \)

**Lemma 15** (see [26]). Let \( E \) have a direct sum decomposition \( E = V \oplus W, \) and \( k = \dim V < \infty. \) Let \( 0 \) be a critical point of \( \Phi \) with \( \Phi(0) = 0, \) \( \Phi \) is bounded below and satisfying (PS) condition. Suppose that, for some \( \rho > 0, \)

\[
\Phi(u) \leq 0, \quad \forall u \in V, \| u \| \leq \rho, \\
\Phi(u) > 0, \quad \forall u \in W, \| u \| \leq \rho. 
\]

(17)

Also, assume that \( \inf_E \Phi < 0. \) Then, \( \Phi \) has at least two nonzero critical points and \( C_0(0, \Phi) = \emptyset. \)

**Lemma 16** (see [27]). Let \( E \) be a real Banach space, \( \Phi \in C^1(E, R); \) assume that \( \Phi \) is even, bounded from below, and satisfying (PS) condition. Assume \( \Phi(0) = 0, \) there exists a set \( E' \subset E \) such that \( E' \) is homeomorphic to \( \mathbb{R}^{k-1} \) by an odd map, and \( \sup \Phi < 0. \) Then, \( \Phi \) has at least \( k \) distinct pairs of critical points.

### 3. Proofs of Main Results

**Lemma 17.** Suppose (H1), (H2) hold, if \( \{ u_n \} \) is a (PS) sequence, then \( \{ u_n \} \) is bounded.

**Proof.** If \( \{ u_n \} \) is a (PS) sequence, that is,

\[
\Phi(u_n) \text{ is bounded, } \Phi'(u_n) \rightarrow 0, \text{ as } n \rightarrow \infty. \quad (18)
\]

From (H2), for some \( \xi > 0 \) small enough, there is a constant \( C_\xi > 0, \) for any \( u \in \mathbb{R}, t \in [0, T] \) such that

\[
| F(t, u) | \leq \frac{1}{2} \left( \frac{T^2(\alpha + 1)}{\Gamma(2\alpha)} | \cos(\pi \alpha) - \alpha - \xi | \right) | u |^2 + C_\xi. \quad (19)
\]

According to (19), for \( u \in E_0^n, u \neq 0, \) one has

\[
\Phi(u) = \int_0^T \left[ -\frac{1}{2} \| D^2 u(t) \|^2 dt \right] - \frac{1}{2} (\alpha(t)|u_n(u)|) \| u_n(u) \| dt + \int_0^T \| u(t) \|^2 dt + C_\xi. \quad (20)
\]

### 4. Journal of Function Spaces
By (21), (22), and (23), we can infer that $\|u_n - u_0\|_n^2 \to 0$, as $n \to \infty$, i.e., $u_n$ strongly converges to $u_0$. Therefore, $\Phi$ satisfies the (PS) condition.

By Lemma 5, we can obtain that there is an orthogonal basis $\{e_i\}$ of $E_0^n$ such that $E_0^n = \text{span}\{e_i; i = 1, 2, \cdots\}$. We define $X_i := \text{span}\{e_i\}, V_k = \left\{ \sum_{i=0}^{n-1} \frac{X_k}{X_i}(k = 1, 2, \cdots) \right\}$. Then, $E_0^n = V_k \oplus Y_k$.

Proof of Theorem 1. From (H1), (H2), one knows $F(t, 0) = 0$ and $I_j(0) = 0, j = 1, \cdots, l$. We find out $\Phi$ has a critical point at 0. Therefore, we can get the linking $E_0^n = V_k \oplus Y_k$ of $\Phi$ at 0.

According to the equivalence of norm of norm space in finite dimension, there exist positive constants $M_1, M_2, M_1', M_2'$, such that

$$M_1 \|u\| \leq \|u\|_{\infty} \leq M_2 \|u\|_a,$$

$$M_1' \|u\|_a \leq \|u\|_{L^2} \leq M_2' \|u\|'_a,$$ (24)

in $u \in V_k$.

First, let $u \in V_k$. Because $V_k$ is finite dimensional, there exists $0 < \rho_1 < 1$ small for $r_0 > 0$, such that

$$|u(t)| \leq \|u\|_{\infty} \leq M_2 \|u\|_a < M_2 \rho_1 < r_0, \quad u \in V_k, \|u\|_a < \rho_1.$$ (25)

For any $r \in (0, r_0)$, we set $\Omega_1 = \{t \in [0, T]: |u| \leq r\}, \Omega_2 = \{t \in [0, T]: r \leq |u| \leq r_0\}, \Omega_3 = \{t \in [0, T]: r_0 \leq |u|\}$, where $[0, T] = \cup_{i=1}^{l} \Omega_i$ and $\Omega_i(i = 1, 2, 3)$ are pairwise disjoint.

Let $F^*(t, u) = F(t, u) - C|u|_a$, for $\|u\|_a < \rho_1, u \in V_k$, combine (H1), (H2) and Lemma 12, we have

$$\Phi(u) = \int_0^T \left[ \frac{1}{2} \left( \frac{1}{2} D^2_n u(t) - D^2_n u(t) dt - \frac{1}{2} T \frac{1}{2} a(t) u(t)^2 dt \right) \right] + \sum_{j=1}^{l} \left( \int_0^T \frac{1}{2} I_j(s) ds \right) - \int_0^T F(t, u(t)) dt - \int_0^T \left( \int_0^t F^*(t, u(t)) dt \right)$$

$$+ \frac{1}{2} \sum_{j=1}^{l} \frac{a_{j+1}}{Y_j + 1} \left( \int_0^t C|u|^a dt - \int_0^T F^*(t, u(t)) dt \right)$$

$$- \int_{\Omega_1} F^*(t, u(t)) dt - \int_{\Omega_2} F^*(t, u(t)) dt - \int_{\Omega_3} F^*(t, u(t)) dt,$$ (26)

where $A_0 = T^{3/2} F'(\alpha) \sqrt{2\alpha - 1}$.

According to (25) and the definition of $\Omega_3$ is empty set, we have $\int_{\Omega_1} F^*(t, u(t)) dt = 0$, for any $u \in V_k$. By (H2), one has $\int_{\Omega_3} F^*(t, u(t)) dt \geq C|u|_a^2 - C|u|_a = 0$. On $\Omega_1$, $|u| < r$. From (H3), we can get $\int_{\Omega_1} F^*(t, u(t)) dt \to 0$, as $r \to 0$.

Then, $\forall u \in V_k, r \in (0, r_0), \|u\|_a \leq \rho \leq 1, \ 1 < \gamma \leq \max \{\gamma_j + 1\} < 2$, according to (26), we can get

$$\Phi(u) \leq \frac{1}{2 \cos (\pi \alpha)} \|u\|_a^2 + \frac{1}{\gamma} \frac{a_{j+1}^{\gamma+1}}{Y_j + 1} \|u\|_a^{\gamma+1} - M^j T^j C \|u\|_a^2 \leq 0.$$

(27)

Hence,

$$\Phi(u) \leq 0, \ \forall u \in V_k, \|u\|_a \leq \rho_1.$$ (28)

Next, set $u \in Y_k$. Because $E_0^n \to C_0^\infty(\{0, T, R\})$ is continuous compact embedding. Hence, for $u \in Y_k \epsilon > 0$, there exists $0 < \rho_1 < 1$ small such that $|u| \leq \|u\|_{\infty} \leq T^{2\alpha-1} \|u\|_{a}/T^2 \alpha (2\alpha - 1)/T^{2\alpha-1} \rho_1 / T^2 (a) (2\alpha - 1) < \epsilon$, for $\|u\|_a \leq \rho_2$.

From (H3), $\forall u < \epsilon$, $u \in Y_k, \|u\|_a \leq \rho_2, t \in [0, T]$, there is $\xi \in (0, \cos (\pi \alpha))$, one has

$$|F(t, u)| \leq (\cos (\pi \alpha) - \xi) \frac{T^2 (a + 1)}{2T^2 a} |u|^2.$$ (29)

From (H1), $\forall |u| < \epsilon, u \in Y_k, \|u\|_a \leq \rho_2$, one has

$$\frac{I_j(u)}{|u|^{2\gamma+1}} > \frac{1}{2} b_j.$$ (30)

Let $b = \min_{j=1}^{l} b_j, \epsilon = \max_{j=1}^{l} \epsilon_j, \forall u < \epsilon, u \in Y_k, \|u\|_a \leq \rho_2 < 1$, by Lemmas 11 and 12 and (29) and (30), we obtain

$$\Phi(u) = \int_0^T \left[ \frac{1}{2} \left( \frac{1}{2} D^2_n u(t) - D^2_n u(t) dt - \frac{1}{2} T \frac{1}{2} a(t) u(t)^2 dt \right) \right] + \sum_{j=1}^{l} \frac{1}{Y_j + 1} \left( \int_0^T I_j(s) ds \right) \geq \frac{1}{2} \cos (\pi \alpha) \|u\|_a^2 - \frac{1}{2} a_1 \gamma T \|u\|_{a}\|u\|_a^2 + \frac{1}{2} T \|u\|_{a}^2 \geq \frac{1}{2} |\|u\|_{a}\|u\|_{a}|^2 \geq \frac{1}{2} \|C|u|_a^2 - \frac{1}{2} a_1 \gamma T \|u\|_{a}\|u\|_a^2 \geq \frac{1}{2} \|C|u|_a^2 - \frac{1}{2} T \|u\|_{a}^2 \geq \frac{1}{2} \left( \|C|u|_a^2 - \frac{1}{2} T \|u\|_{a}^2 \right) \geq 0.$$ (31)

Hence,

$$\Phi(u) \geq 0, \forall u \in Y_k, \|u\|_a \leq \rho_2.$$ (32)

Let $\rho = \min \{\rho_1, \rho_2\}$, from (28) and (32), we obtain

$$\Phi(u) \leq 0, \ \forall u \in V_k, \|u\|_a \leq \rho,$$

$$\Phi(u) > 0, \ \forall u \in Y_k, \|u\|_a \leq \rho.$$ (33)

It follows from Lemmas 17 and 18 that $\Phi$ is bounded from below and satisfies the (PS) condition. Then, from Lemma 15,
we can get $\Phi$ has at least two nonzero critical points, and $C_k$ ($\Phi, 0) = 0$, so $u = 0$ is a homological nontrivial point of $\Phi$. Hence, the system (1) has at least three classical solutions.

Proof of Theorem 2. According to (H4), we can deduce that $\Phi$ is even. By Lemmas 17 and 18, we know $\Phi$ is bounded from below and satisfies the (PS) condition. For given $\rho > 0$, set $E^\prime_p = \{ u \in V_k : \| u \| = \rho \}$. By (27), if $\rho$ is small enough, one has $\text{sup} \Phi(u) < 0$. Clearly, $\dim V_k = k$. Then, we can conclude that $\Phi$ has at least $k$ distinct pairs of critical points from Lemma 16. Hence, the system (1) has at least $k$ distinct pairs of classical solutions. We complete the proof.

Example 19.

\[
\begin{aligned}
- \frac{1}{2} \frac{d}{dt} \left( D_t^{0,b} + D_t^{0,\sigma} \right) u'(t) &= \frac{2}{5} u(t) + V(t, u(t)), \quad t \neq t_j, a.e.t \in [0, 1], \\
\Delta(D_t^{0,\sigma} u)(t_j) &= I_j(u(t_j)), \quad t_j \in [0, 1], j = 1, 2, \ldots, l, \\
u(0) &= u(T) = 0.
\end{aligned}
\] (34)

According to (34), we can see that $\beta = 0.6, \alpha = 0.7, a(t) = 2/5, T = 1$. Let $I_j(u) = (4/3)u^{1/3}$, then the condition (H1) holds with $a_j = 3/2, \gamma_j = 1/3, b_j = 4/3, c_j = 1/3$.

Let $F(t, u(t)) = 1/15(1 + \sin^2 t)|u|^2(1/\ln(|u|^{2/3} + 1.5))$, $a_j = 9/20$. By simple calculations, we can get $\Gamma^2(\alpha + 1)/T^{2a} = 0.84474, \cos(0.7\pi) = 0.58778$,

\[
\lim_{|t| \to \infty} \frac{F(t, u)}{|u|^2} \longrightarrow 0 < \frac{1}{2} \left( \frac{\Gamma^2(\alpha + 1)}{T^{2a}} - a_j \right) \approx 0.02326;
\] (35)

then, the condition (H2) holds.

By (H3), we know

\[
\lim_{|u| \to 0} \frac{|F(t, u)|}{|u|^2} \leq 0.32884 < \frac{\Gamma^2(\alpha + 1)}{2T^{2a}} \approx 0.42237. \quad (36)
\]

Let $r = e - 1.7, r_0 = e - 1.5, C = 2/25, \gamma = 6/5$; then, for $e - 1.7 \leq |u| \leq e - 1.5$, we have

\[
F(t, u) > 0.14471|u|^2 \geq \frac{2}{25} |u|^{6/5};
\] (37)

then, the condition (H3) is satisfied.

It easy to see that the condition (H4) holds.

According to Theorem 1, the system (1) exists at least three classical solutions. According to Theorem 2, the system (1) possesses at least $k$ distinct pairs of classical solutions.

4. Conclusions

In this work, we study perturbed fractional differential equation with impulses. We give sufficient conditions of the existence of at least three classical solutions and at least $k$ distinct pairs of classical solutions for problems (1), where $k$ is the dimension of $V_k$.
