Abstract Four novel strains were isolated: PWU4<sup>T</sup> and PWU20<sup>T</sup> were both from soil in Germany, PWU5<sup>T</sup> was isolated from soil in India and PWU37<sup>T</sup> was obtained from sheep faeces collected on the Island of Crete. Cells of each were observed to be Gram-negative, strictly aerobic, rod shaped, and to grow optimally between 28 and 34 °C, between pH 7.0 and 8.0 and without the addition of NaCl. The strains were found to be catalase and oxidase-negative and able to grow on most mono- and disaccharides, a few polysaccharides and organic acids. Their predominant menaquinone was identified as MK-7. Their major fatty acids were identified as C<sub>16:1</sub>ω7<sub>c</sub> (PWU4<sup>T</sup> and PWU20<sup>T</sup>) and C<sub>16:1</sub>ω5<sub>c</sub> (PWU5<sup>T</sup> and PWU37<sup>T</sup>). The DNA G+C contents of strains PWU4<sup>T</sup>, PWU20<sup>T</sup>, PWU5<sup>T</sup> and PWU37<sup>T</sup> were determined to be 50.2 mol%, 51.6 mol %, 39.8 mol% and 53.8 mol%, respectively. The 16S rRNA gene sequence analysis revealed that the close relatives *Ohtaekwangia koreensis* 3B-2<sup>T</sup> and *Ohtaekwangia kribbensis* 10AO<sup>T</sup> share less than 93.8% sequence similarity. The strains were classified in two groups, where PWU4<sup>T</sup> and PWU20<sup>T</sup> share 93.0% sequence similarity, and PWU5<sup>T</sup> and PWU37<sup>T</sup> share 97.5% sequence similarity. However, the members of each group were concluded to represent different species based on the low average nucleotide identity (ANI) of their genomes, 69.7% and 83.8%, respectively. We propose that the four strains represent four novel species of two new genera in the family *Cytophagaceae*. The type species of the novel genus *Chryseosolibacter* is *Chryseosolibacter histidini* gen. nov., sp. nov. with the type strain PWU4<sup>T</sup> (= DSM 111594<sup>T</sup> = NCCB 100798<sup>T</sup>), whilst strain PWU20<sup>T</sup> (= DSM 111597<sup>T</sup> = NCCB 100800<sup>T</sup>) is the type strain of a second species, *Chryseosolibacter indicus* sp. nov. The type species of the novel genus *Dawidia* is *Dawidia cretensis* gen. nov., sp. nov. with the type strain PWU5<sup>T</sup> (= DSM 111596<sup>T</sup> = NCCB 100799<sup>T</sup>),
whilst strain PWU37T (= DSM 111595T = NCCB 100801T) is the type stain of a second species, *Dawidia soli* sp. nov.

**Introduction**

The family *Cytophagaceae* was originally introduced in 1940 by Stanier (Stanier 1940) and it is the largest family within the order *Cytophagales* (Albers and Siebers 2014). Isolates of the family *Cytophagaceae* are Gram-stain negative chemoorganotrophic aerobic bacteria, but also a few anaerobes (Nakagawa 2011). Furthermore, they are widely distributed in nature such as soil (Hirsch et al. 1998; Kim et al. 2013; Zhang et al. 2009), freshwater (Baik et al. 2006; Maejima et al. 2020), airborne (Buczolits et al. 2002), desert (Zhou et al. 2007) and a glacier field (Chaturvedi et al. 2005).

Since the ‘golden age’ of antibiotic discovery, members of the phylum *Bacteriodetes* including the classes *Flavobacteria* and *Cytophagia*, have contributed as producers of antimicrobial bioactive compounds (Ikemori et al. 1990; Katayama et al. 1985; Okanya et al. 2011a, b; Park et al. 2008; Singh et al. 1982). During the screening of antimicrobial activity from members of the Reichenbach culture collection held at the Helmholtz Center for Infection Research (HZI) Germany, four novel bacterial strains (designated PWU4T, PWU5T, PWU20T and PWU37T) were identified. The aim of the present study was to explore the taxonomic status of the four bacteria as novel species by using a polyphasic approach.

**Material and methods**

**Isolation of bacterial strains and culture conditions**

Strains PWU4T, PWU20T and PWU37T were isolated from soil samples collected in May 1990 at Braunschweig, Germany (52.22090N 10.50902E, PWU4T); in May 1989 at Lucknow, Uttar Pradesh, India (26.8684N 80.90979E, PWU20T); in September 1991 at Braunschweig (52.21501N 10.53329E, PWU37T); strain PWU5T was isolated from sheep faeces with plant residues collected in July 1988 at Crete Island (35.2463N 25.09705E). The strains were isolated using a dilution method on agar plates following the protocol of Reichenbach (Reichenbach 1992), maintained in E medium and kept in this medium at −80 °C for long-term preservation. *Ohtaekwangia koreensis* 3B-2T KCTC23018T and *Ohtaekwangia kribbensis* 10AOT KCTC23019T, which were isolated by Yoon et al. (2011a), were used as references strains and were grown under the same culture conditions.

**Morphological, physiological and chemotaxonomy analysis**

Phenotypic characterisation was performed following the protocols described previously (Kim et al. 2013; Maejima et al. 2020; Yoon et al. 2011a). Morphological characteristics of the strains were observed using light microscopy (Zeiss Axio Scope A1. Microscope) with Axio-Vision Rel. 4.8 software. For physiological and chemotaxonomic tests, the four strains were grown without NaCl in E broth medium at their optimum pH and temperature of pH 7 and 30 °C for strain PWU4T, pH 7 and 28 °C for strains PWU20T and PWU5T, pH 7.4–8.0 and 34 °C for strain PWU37T. Growth at various temperatures, pH and NaCl concentrations was carried out aerobically on E agar medium. To determine the optimal temperature and pH for growth, duplicate plates were incubated at 4–44 °C and also at pH 5.0–9.5 as described previously (Mohr et al. 2018). Anaerobic growth was
performed using E agar plates with Anaerocult P (Merck) in a candle jar (Jones 1981) for 3 weeks of incubation. Catalase and oxidase activities were performed according to Maejima et al. (2020) and the production of flexirubin-type pigments was tested according to Reichenbach (Reichenbach 1992). Carbon source utilisation assays were carried out in duplicate using E broth medium along with the Gen III MicroPlate system (Biolog) according to the manufacturer’s protocol. Enzyme activities was assayed using the API ZYM (Humble et al. 1977) and API CAMPY (Huysmans et al. 1995) systems (bioMérieux), according to the protocols of the manufacturer. Antibiotic resistances was tested on E agar medium using the disc-diffusion plate method (Bauer et al. 1966).

For chemotaxonomic analysis, strains PWU4T, PWU5T, PWU20T and PWU37T were grown on M broth medium. Freeze-dried cells were prepared for detection of the major isoprenoid quinones, the polar lipids and the cellular fatty acids of the strains. In brief, 200 ml well-grown cultures were centrifuged at 9000 rpm for 10 min and the pellet was washed three times followed by centrifugation 9000 rpm for 10 min, and then freeze-drying for two days. The isoprenoid quinone was extracted according to Komagata and Suzuki (1988) and analysed further using HPLC (Agilent 1260 Series; Agilent technology USA). The polar lipids were determined by two-dimensional TLC (Lechevalier et al. 1977; Minnikin et al. 1984). The Sherlock Microbial Identification System (MIDI) was used for identifying cellular fatty acids (Sasser 2009).

16S rRNA gene sequencing and phylogenetic analysis

The genomic DNA of each strain were extracted using an Invisorb Spin Plant mini kit (Stratec Molecular, Germany). After 5 days incubation at room temperature, cells were harvested from E broth medium and the pellet was further processed through DNA extraction following the manufacturer’s protocol. The 16S rRNA genes was amplified using the bacterial universal primer set 27F and 1492R following the protocol of Mohr et al. (2018). After the PCR products were confirmed on 0.8% agarose gel, they were purified using the NucleoSpin Gel and PCR Clean up Kit (Macherey–Nagel, Düren, Germany). The 16S rRNA gene sequences of strain PWU4T, PWU5T, PWU20T and PWU37T were determined and compared to sequences from the GenBank7EMBL/DDBJ public database. The Genome to Genome Distance Calculator (GGDC 2.1) web server (Meier-Kolthoff et al. 2013), available at http://ggdc.dsmz.de/ was used to infer the 16S rRNA phylogenetic relationships (Meier-Kolthoff et al. 2014). Briefly, after creating a multiple sequence alignment with MUSCLE (Edgar 2004), maximum likelihood and maximum parsimony trees were inferred with RAxML (Stamatakis 2014) and TNT (Goloboff et al. 2008), respectively. For maximum likelihood, rapid bootstrapping in conjunction with the autoMRE boot stopping criterion (Pattengale et al. 2010) and subsequent search for the best tree was used, while for maximum parsimony, 1000 bootstrapping replicates were used.

Genome sequence analysis

Draft genome sequences of each of the four strains were determined according to Mohr et al. (2018) and were submitted to the GenBank/EMBL/DDBJ public database. Automated genome annotation was performed using DFAST (Tanizawa et al. 2018). The average nucleotide identity (ANI) values between the genomes of the strains and their close relatives were calculated with the OrthoANIu algorithm using the EZ-Genome web services (Yoon et al. 2017). Digital DNA-DNA hybridization (dDDH) values were calculated using the GGDC 2.1 online service at http://ggdc.dsmz.de/distcalc2.php (Meier-Kolthoff et al. 2014). The phylogenomic analysis, matrix of AAI (Amino Acid Identity) and matrix of POCP (Percentage of Conserved Protein) were carried out using the EDGAR 3.0, a free bioinformatic platform available under https://edgar3.computational.bio.uni-giessen.de where the genome sequence data were uploaded and the output was visualized (Dieckmann et al. 2021).

Results and discussion

Morphological, physiological and biochemical analyses

The cells of strains PWU4T, PWU5T, PWU20T and PWU37T were observed to be straight rods, 2.32–7.62 μm in length, to stain Gram-negative and
to form yellow colonies on E medium (Okanya et al. 2011a, b).

Strains PWU4T and PWU20T were found to grow at 21–40 °C (optimum at 28–30 °C), while strains PWU5T and PWU37T grow at 21–34 °C (optimum at 28–34 °C). Moreover, strain PWU4T grows at pH 5.5–8.0 (optimum at pH 7), strain PWU5T grows at pH 6.5–8.5 (optimum at pH 7), strain PWU20T grows at pH 6.5–9.0 (optimum at pH 7) and strain PWU37T grows at pH 5.0–9.5 (optimum at pH 7.4–8.0). The reference strains Ohtaekwangia koreensis (3B-2T) and Ohtaekwangia kribbensis (10AOT) (Yoon et al. 2011a), optimally grow at 30 °C in a ranged of 10–39 °C and pH 6.5–7.5 (Table 1). Salt tolerance was tested over the range of 0.2–1.6% NaCl (w/v). Strains PWU4T, PWU5T, PWU20T and PWU37T can tolerate a concentration up to 0.4, 0.6, 0.8 and 1.0% (w/v), respectively. Reference strains such as members of the genus Ohtaekwangia, which were isolated from the marine environment, tolerate a concentration up to 0.1% of NaCl (w/v) (Maejima et al. 2020) and members of Cytophagaceae from the marine environment, tolerate up to 1.0% of NaCl (w/v), respectively. Reference strains such as members of the genus Cytophagaceae are microaerophilic, capnophilic (CO2-requiring) or facultatively anaerobic. No strains are microaerophilic, capnophiles of Cytophagaceae tolerate up to 0.1% of NaCl (w/v) (Kim et al. 2013; Maejima et al. 2020; Yoon et al. 2011b) except the family Flavobacteriaceae, which have menaquinones of type 6 (MK6) (Albers and Siebers 2014). The major polar lipids of strains PWU4T, PWU5T, PWU20T and PWU37T were identified as phosphatidylethanolamine and an unidentified polar lipid. The fatty acid profiles of the four strains are shown in Table 2, along with those of the reference strains used in this study. Saturated and mono-unsaturated fatty acids with iso C15:0 and C16:1ω7c were observed in all the strains including the reference strains. The major fatty acids of strains PWU4T, PWU5T, PWU20T and PWU37T were identified as C16:1ω7c (32.5%), C16:1ω5c (43.8%), iso C15:0 (43.6%) and C16:1ω5c (38.5%), respectively. In contrast to strain PWU4T where C16:1ω7c was found to be the major fatty acid, this fatty acid was much less abundant in strain PWU37T (9.0%). Moreover, C16:1ω5c was found to be the major fatty acid in strains PWU5T and PWU37T but not in strains PWU4T and PWU20T. Albers and Siebers (2014) highlighted that branched, unsaturated or hydroxyl fatty acids represented the predominant cellular fatty acids in most members of the family Cytophagaceae.

Phylogenetic and genome analysis

The phylogenetic tree showed that strains PWU4T, PWU5T, PWU20T and PWU37T belong to the family Cytophagaceae and that they are closely related but distinct from members of the genus Ohtaekwangia (Figs. 1, 2). The four strains shared 91.63 to 97.82% 16S rRNA gene sequence similarity with each other (Table 3). The current closest relatives of strain PWU4T are O. koreensis 3B-2T (92.1% 16S rRNA gene sequence similarity), O. kribbensis 10AO1T (92.0%) and Chryseolinea solis KIS68-18T (91.0%), whereas the current closest relatives of strain PWU5T are O. koreensis 3B-2T (93.6% 16S rRNA gene sequence similarity), O. kribbensis 10AO1T (93.1%), and Chryseolinea serpens RYG1T (92.3%). The current closest relatives of strain PWU20T are O. kribbensis 10AO1T (92.5% 16S rRNA gene sequence similarity), O. koreensis 3B-2T (92.0%), and C. solis KIS68-18T (90.6%). The current closest relatives of strain PWU37T are O. kribbensis 10AO1T (93.7% 16S rRNA gene sequence similarity), O. koreensis 3B-2T...

| α-Keto-butyric-acid                                  | −    | +    | −    | +    | −    | −    |
(93.2%) and \textit{C. soli} KIS68-18\textsuperscript{T} (92.0%). Notably, all of these values are below the 94.5% 16S rRNA threshold suggested by Yarza et al. (2014) as being useful for delineating prokaryotic genera.

The phylogenomic tree (Fig. 2), AAI matrix (Fig. 3) and POCP matrix (Fig. 4) confirmed the close relationships of the four strains in the two different genera. Strain PWU5\textsuperscript{T} and PWU37\textsuperscript{T} are grouped in the same genus and strain PWU4\textsuperscript{T} and PWU20\textsuperscript{T} together in a second genus. However, it was noted that between strains PWU4\textsuperscript{T} and PWU20\textsuperscript{T} share only 93.2% 16S rRNA similarity (Table 3) and differed in fatty acid profiles and GC content. At this point we cautiously place these two strains in the same genus based on the 16S rRNA, phylogenomic, AAI and POCP analysis but we noted that further analyses should be conducted.

to be 50.2 mol%, 51.6 mol%, 39.8 mol% and 53.8 mol%, respectively. The pairwise digital DNA-DNA hybridization (dDDH) revealed values of 13% to 50% and confirmed that all of strains represented distinct new species. Strains PWU4T, PWU5T, PWU20T, and PWU37T shared ANI values of 69.2%, 69.9%, 69.5% and 69.7% with O. koreensis 3B-2T, respectively (Table 4). The low ANI values below the threshold of 95.0–96.0% (Richter and Rosselló-Móra 2009) confirmed that all four of these strains represented different species to current members of the genus Ohtaekwangia.

**Fig. 1** Neighbor-joining phylogenetic tree of partial 16S rRNA gene sequences of strains PWU4T, PWU5T, PWU20T and PWU37T in comparison with other representatives of the phylum Bacteroidetes. Bootstrap value (1000 resampling) at branch nodes (Maximum Parsimony/Maximum-Likelihood). Bar 0.09 substitutions per nucleotide position and Escherichia coli DSM 30083 was used as an outgroup

**Taxonomic conclusions**

Morphological, biochemical, physiological and phylogenetic characteristics of strains PWU4T, PWU5T, PWU20T and PWU37T confirmed their position within the family Cytophagaceae. However, the obtained genetic data between strains PWU4T, PWU5T, PWU20T, PWU37T and related genera differentiated them from known genera of the family Cytophagaceae. Therefore, strains PWU4T, PWU5T, PWU20T and PWU37T should be classified in two new genera within the family Cytophagaceae.
Description of *Chryseosolibacter* gen. nov.

*Chryseosolibacter* (Chry.se.o.so.li.bac.ter. Gr. masc. adj. chryseos, golden; L. gen. n. soli, soil; L. neut. n. bacter, bacteria; N.L. neut. n. *Chryseosolibacter*, the color of colony bacteria is something like golden soil.

Gram-stain negative, rod-shaped, asporogenous, non-motile, mesophilic, heterophilic and aerobic bacteria. Catalase and oxidase negative. Growth is observed on D-gluconic acid and methyl pyruvate.

The major cellular fatty acids are *iso*-C\textsubscript{15:0} and C\textsubscript{16:1} \(\omega7c\). The major respiratory quinone is menaquinone-7 (MK-7). The major identified polar lipid is phosphatidylethanolamine. Member of the family *Cytophagaceae*. The type species is *Chryseosolum histidini*.

Description of *Chryseosolibacter histidini* sp. nov.

*Chryseosolibacter histidini* (his.ti.di’ni. N.L. gen. n. histidini, of histidine, an amino acid, which can be utilised by this strain).

In addition to the characteristics listed in the genus description, the species has the following characteristics: cells are 2.56–6.67 \(\mu\)m long and appear as single cells. Colonies are irregular and yellow on E agar plates after 5 days of cultivation. Growth occurs between 21 and 40 °C (optimum 30 °C), between pH 5.5 and 8.0 (optimum pH 7) and NaCl tolerance 0.4% (w/v). Positive for phosphatase alkaline, esterase (C4), esterase lipase (C8), leucine arylamidase, valine arylamidase, cystine arylamidase, trypsin, chymotrypsin, phosphatase

Table 3 Matrix similarity of 16S rRNA gene sequence similarities of strains PWU\textsuperscript{4T}, PWU\textsuperscript{5T}, PWU\textsuperscript{20T} and PWU\textsuperscript{37T} compared with members of the genus *Ohtaekwangia*

| Strain   | PWU\textsuperscript{4T} | PWU\textsuperscript{5T} | PWU\textsuperscript{20T} | PWU\textsuperscript{37T} |
|----------|-----------------|-----------------|-----------------|-----------------|
| PWU\textsuperscript{4T} | 100  | 91.63 | 93.21 | 91.98 |
| PWU\textsuperscript{5T} | 91.63 | 100  | 97.82 | 92.93 |
| PWU\textsuperscript{20T} | 93.21 | 97.82 | 100  | 93.13 |
| PWU\textsuperscript{37T} | 91.98 | 92.93 | 93.13 | 100  |
| *O. kribbensis* 10AO\textsuperscript{T} | 92  | 93.1 | 92.5 | 93.7 |
| *O. koreensis* 3B-2\textsuperscript{T} | 92.1 | 93.6 | 92  | 93.2 |

Fig. 2 The phylogenomic inference of strains PWU\textsuperscript{4T}, PWU\textsuperscript{5T}, PWU\textsuperscript{20T} and PWU\textsuperscript{37T} within the EDGAR platform from genome sequences. The tree is built out of core of 309 genes per genome, 6180 in total. The core has 112,516 AA-residues/bp per genome, 2,250,320 in total. The numbers above branches are Shimodaira-Hasagawa (SH) branch support value. *Escherichia coli* DSM 30,083 was used as an outgroup
acid, naphthol-AS-B1-phosphohydrolase, α-galactosidase, β-galactosidase, α-glucosidase, β-glucosidase, N-acetyl-β-glucosamidase, α-mannosidase, α-fucosidase, urease, esterase and alcaline phosphatase. Weak activities of lipase (C14) and β-glucoronidase. No growth is observed on dextrin, D-maltose, D-trehalose, D-cellobiose, gentiobiose, sucrose, D-turanose, stachyose, D-raffinose, α-D-lactose, D-melibiose, N-acetyl-D-glucosamine, N-acetyl-D-galactosamine, α-D-glucose, D-mannose, L-fucose, D-arabitol, glycerol, gelatin, glycyl-L-proline, L-alanine, L-arginine, L-serine, pectin, D-galacturonic acid, L-galactonic acid lactone D-gluconic acid, glucuronic acid, gluconic acid, mucic acid, D-lactic acid methyl ester, citric acid, D-malic acid, L-malic acid, bromo-succinic acid, tween 40, γ-amino-butyric acid, α-ketobutyric acid, acetoacetic acid, and acetic acid. The DNA G+C content of the type strain is 50.2 mol%.

The type strain PWU4<sup>T</sup> (= DSM 111594<sup>T</sup> = NCCB 100798<sup>T</sup>) was isolated from a soil sample collected in May 1990 at Braunschweig, Germany (52.22090N 10.50902E). The 16S rRNA gene and whole-genome sequences of PWU4<sup>T</sup> have been deposited in GenBank/EMBL/DDBJ under accession numbers MW182516 and JAHESF000000000, respectively.

Description of Chryseosolibacter indicus sp. nov.

Chryseosolum indicus (in’di.cus. L. neut. adj. indicus, India, the origin of the soil sample from which the type strain was isolated).

In addition to the characteristics listed in the genus description, the species has the following characteristics: cells are 2.32–6.41 µm long and appear as single cells. Colonies are irregular and yellow on E agar plates after 5 days of cultivation. Growth occurs between 21 and 40 °C (optimum
28 °C), between pH 6.5 and 9.0 (optimum pH 7) and NaCl tolerance below 0.8% (w/v). Positive for phosphatase alkaline, leucine arylamidase, valine arylamidase, cystine arylamidase, chymotrypsin, phosphatase acid, naphthol-AS-B1-phosphohydrolase, α-galactosidase, β-galactosidase, β-glucoronidase, α-glucosidase, β-glucosidase, N-acetyl-β-glucosamidase, α-mannosidase, urease, esterase and alcaline phosphatase. Weak activities of esterase (C4), esterase lipase (C8), lipase (C14), trypsin and no activities for α-fucosidase. No growth is observed on dextrin, D-maltose, D-cellobiose, gentiobiose, N-acetyl-D-glucosamine, N-acetyl-β-D-galactosamine, D-fructose, D-fructose-6-PO₄, L-arginine, L-histidine, L-galactonic acid lactone D-gluconic acid, p-hydroxy-phenylacetic acid, L-malic acid, bromo-succinic acid, tween 40, α-keto-butyric-acid, propionic acid, and acetic acid. The DNA G + C content of the type strain is 39.8 mol %.

The type strain PWU20ᵀ (= DSM 111597ᵀ = NCCB 100800ᵀ) was isolated from a soil sample collected in May 1989 at Lucknow, Uttar Pradesh, India (26.8684N 80.90979E). The 16S rRNA gene and whole-genome sequences of strain PWU20ᵀ have been deposited in GenBank/EMBL/DDBJ under accession numbers MW182517 and JAHESD0000000000, respectively.

Table 4 Matrix of Average Nucleotide Identity (ANI) of strains PWU4ᵀ, PWU5ᵀ, PWU20ᵀ and PWU37ᵀ compared with Ohtaekwangia koreensis 3B-2ᵀ

| Strain        | PWU4ᵀ | PWU5ᵀ | PWU20ᵀ | PWU37ᵀ |
|---------------|-------|-------|--------|--------|
| PWU4ᵀ         | 100   | 70.22 | 69.37  | 70.77  |
| PWU5ᵀ         | 70.22 | 100   | 67.9   | 83.85  |
| PWU20ᵀ        | 69.37 | 67.9  | 100    | 68.04  |
| PWU37ᵀ        | 70.77 | 83.85 | 68.04  | 100    |

O. koreensis 3B-2ᵀ 69.23 69.92 69.51 69.66

Fig. 4 Matrix of POCP (Percentage of Conserved Protein) of strains PWU4ᵀ, PWU5ᵀ, PWU20ᵀ and PWU37ᵀ in comparison with other representatives of the phylum Bacteriodetes. Results were obtained using the EDGAR 3.0 platform and Escherichia coli DSM 30,083 was used as an outgroup.
Description of *Dawidia* gen. nov.

*Dawidia* (Da.wi’di.a N.L. fem. n. Dawidia, named in honor of the German microbiologist Dr. Wolfgang Dawid, author of *Experimentelle Mikrobiologie.)*

Gram-stain negative, rod-shaped, asporogenous, non-motile, mesophilic, heterophilic and aerobic bacteria. Catalase and oxidase-negative. Growth is observed on D-cellobiose, L-fucose, D-arabitol, L-malic acid, and α-keto-butyric-acid. The major cellular fatty acids are iso-C15:0 and C16:1 ω5c. The major respiratory quinone is menaquinone-7 (MK-7). The major identified polar lipids is phosphatidylethanolamine (PE). Member of the family *Cytophagaceae*. The type species is *Dawidia cretensis*.

Description of *Dawidia cretensis* sp. nov.

*Dawidia cretensis* (cre.ten’sis. L. fem. adj. cretensis, Cretan, the source of the sample from the type strain was isolated).

In addition to the characteristics listed in the genus description, the species has the following characteristics: cells are 4.37–7.62 µm long and appear as single cells. Colonies are irregular and yellow on E agar plate after 5 days of cultivation. Growth occurs between 21 and 34 °C (optimum 34 °C), between pH 6.5 and 8.5 (optimum pH 7) and NaCl tolerance below 0.6% (w/v). Positive for phosphatase alkaline, leucine arylamidase, valine arylamidase, cystine arylamidase, phosphatase acid, naphthol-AS-B1-phosphohydrolase, α-galactosidase, β-galactosidase, α-glucosidase, β-glucosidase, N-acetyl-β-glucosaminidase, α-fucosidase, esterase and alkaline phosphatase. Weak activities of esterase (C4), esterase lipase (C8), lipase (C14) and no activities for trypsin, chymotrypsin, β-galactosidase, α-mannosidase, and urease. No growth is observed on dextrin, D-maltose, gentiobiase, D-turanose, D-raffinose, α-D-lactose, D-melibiose, D-salicin, N-acetyl-D-glucosamine, N-acetyl-β-D-galactosamine, N-acetyl-D-galactosamine, α-D-glucose, D-fructose, D-sorbitol, myo-inositol, D-glucose-6-PO4, D-fructose-6-PO4, D-aspartic acid, D-serine, gelatin, L-alanine, L-arginine, L-aspartic Acid, L-histidine, pectin, L-galactonic acid lactone D-gluconic acid, gluconic acid, glucuornamide, mucic acid, p-hydroxyphenylactic acid, methyl pyruvate, D-lactic acid methyl ester, L-lactic acid, citric acid, α-keto-glutaric acid, D-malic acid, bromo-succinic acid, tween 40, α-hydroxy-butyric acid, β-hydroxy-D,L-butyric acid, acetoacetic acid, propionic acid, acetic acid and formic acid. The DNA G+C content of the type strain is 53.8 mol %.

The type strain PWU37T (=DSM 111595T = NCCB 100801T) was isolated from a soil sample collected in September 1991 at Braunschweig (52.21501N 10.53329E). The 16S rRNA gene and whole-genome sequences of strain PWU37T have been deposited in GenBank/EMBL/DDBJ under accession numbers MW182518 and JAHESE00000000, respectively.

Description of *Dawidia soli* sp. nov.

*Dawidia soli* (so.li. L. gen. n. soli, of soil, the source of the type strain).

In addition to the characteristics listed in the genus description, the species has the following characteristics: cells are 3.1–6.43 µm long and appear as single cells. Colonies are irregular and yellow on E agar plate after 5 days of cultivation. Growth occurs between 21 and 34 °C (optimum 34 °C), between pH 5.0 and 9.5 (optimum pH 7.4 until 8.0) and NaCl tolerance below 1.0% (w/v). Positive for phosphatase alkaline, leucine arylamidase, valine arylamidase, cystine arylamidase, phosphatase acid, naphthol-AS-B1-phosphohydrolase, α-galactosidase, β-galactosidase, α-glucosidase, β-glucosidase, N-acetyl-β-glucosaminidase, α-fucosidase, esterase and alkaline phosphatase. Weak activities of esterase (C4), esterase lipase (C8), lipase (C14) and no activities for trypsin, chymotrypsin, β-galactosidase, α-mannosidase, and urease. No growth is observed on dextrin, D-maltose, gentiobiase, D-turanose, D-raffinose, α-D-lactose, D-melibiose, D-salicin, N-acetyl-D-glucosamine, N-acetyl-β-D-galactosamine, N-acetyl-D-galactosamine, α-D-glucose, D-fructose, D-sorbitol, myo-inositol, D-glucose-6-PO4, D-fructose-6-PO4, D-aspartic acid, D-serine, gelatin, L-alanine, L-arginine, L-aspartic Acid, L-histidine, pectin, L-galactonic acid lactone D-gluconic acid, gluconic acid, glucuornamide, mucic acid, p-hydroxyphenylactic acid, methyl pyruvate, D-lactic acid methyl ester, L-lactic acid, citric acid, α-keto-glutaric acid, D-malic acid, bromo-succinic acid, tween 40, α-hydroxy-butyric acid, β-hydroxy-D,L-butyric acid, acetoacetic acid, propionic acid, acetic acid and formic acid. The DNA G+C content of the type strain is 53.8 mol %.

The type strain PWU37T (=DSM 111595T = NCCB 100801T) was isolated from a soil sample collected in September 1991 at Braunschweig (52.21501N 10.53329E). The 16S rRNA gene and whole-genome sequences of strain PWU37T have been deposited in GenBank/EMBL/DDBJ under accession numbers MW182518 and JAHESE00000000, respectively.
DDBJ under accession numbers MW182519 and JAHESC000000000, respectively.

Acknowledgements We are thankful to Birte Trunkwalter for providing strains. We also thank Klaus Peter Conrad and Dr. Chandra Risdian for the quinone analysis. Stephanie Schulz for the analysis of polar lipids. Wera Collisin for the fatty acid methyl ester analysis. Ulrich Nübel and Vera Junker at DSMZ for genome sequencing.

Authors contributors Conceptualized: SO, JW. Supervised: JW. Performed the experiments except genome: SO, SL, FA. Analyzed the data: SO, SL, FA, LF. Wrote the paper-original JW. Draft preparation: SO, SL. -review and edited SO, SL, LF and FA. Performed the experiments for genome sequencing.

Funding This research has supported full funding by German Academic Exchange Service (DAAD)-GINAICO program number 57342738 (91654412) for the PhD scholarship. The EDGAR platform is financially supported by the BMBF grant FKZ 031A533 within the de.NBI network.

Conflict of interest The author declares that there are no conflicts of interest.

Ethical approval This research did not contain any studies with human or animals performed by any of the authors.
