Abstract
Two new species of Betacixius Matsumura, 1914 (Fulgoromorpha, Cixiidae), B. latissimus Zhi & Chen, sp. nov. and B. maguanensis Zhi & Chen, sp. nov., are described from Yunnan Province, China. The genus is reviewed and a key to all known species is provided. The females of four Chinese species are described for the first time.

Keywords
Female genitalia, Fulgoroidea, morphology, Oriental region, taxonomy

Introduction

Betacixius is a small genus established by Matsumura (1914) for 23 species in the subfamily Cixiinae (Hemiptera, Fulgoromorpha, Cixiidae), with B. ocellatus Matsumura, 1914 as the type species. Betacixius belongs to the tribe Semonini (Emeljanov 2002) and has been taxonomically studied by various authors, with a number of species published successively (e.g. Jacobi 1944; Fennah 1956; Hori 1982; Tsaur et al. 1991; Zhang and Chen 2011).
Recent study of some Chinese specimens has found two new species, *B. latisimus* Zhi & Chen, sp. nov. and *B. maguanensis* Zhi & Chen, sp. nov., which are described here. Female specimens of four species are also described for the first time. So far, including the two new species, the genus currently now counts for 25 valid species and two subspecies, all distributed in the Palaearctic and Oriental regions (Bourgoin 2020).

**Materials and methods**

The morphological terminology and measurements follow Bourgoin (1987) and Bourgoin et al. (2015). The morphological terminology of female genitalia follows Bourgoin (1993). Body length was measured from apex of vertex to tip of forewing; vertex length was measured the median length of vertex (from apical transverse carina to tip of basal emargination). Fuchsin staining was used to highlight female genitalia structures studied. External morphology and drawings were made with the aid of a Leica MZ 12.5 stereomicroscope. Photographs were taken with KEYENCE VHX-1000 system. Illustrations were scanned with a CanoScan LiDE 200 flatbed scanner and imported into Adobe Photoshop 7.0 for labeling and figure composition. The distribution map was generated with Google Earth Pro v. 7.3.2 (Google LLC). The dissected male and female genitalia are preserved in glycerin in small plastic tubes pinned together with the specimens.

The type specimens are deposited in the Institute of Entomology, Guizhou University, Guiyang, Guizhou Province, China (GUGC).

**Taxonomy**

*Betacixius* Matsumura, 1914

*Betacixius* Matsumura, 1914: 412; Tsaur et al. 1991: 27; Zhang and Chen 2011.

**Type species.** *Betacixius ocellatus* Matsumura, 1914, by original designation.

**Diagnosis.** See Zhang and Chen (2011: 48).

**Distribution.** China, Japan, Vietnam.

**Type material.** **Holotype:** ♂, China: Yunnan Province, Jinping County, Fenshuiling National Nature Reserve (22°46'N, 103°13'E), 7–8 June 2016, Liang-Jing Yang, Ying-Jian Wang; paratypes: 1 ♂ 1 ♀, same data as holotype.

**Description.** **Body length:** male 6.9–7.1 mm (n = 2), female 7.2 mm (n = 1).

**Coloration.** General color blackish brown (Fig. 3A–D). Eyes reddish brown, lateral ocelli dark red and median ocellus yellow. Vertex dark brown, pronotum yellowish to blackish brown and mesonotum blackish brown. Face generally dark brown, yellowish white above frontoclypeal suture. Postclypeus yellowish brown and anteclypeus blackish brown. Rostrum generally yellowish brown except darker tip. Forewing semitranslucent, base with a broad transverse band from dorsal margin to sutural margin of clavus; clavus with a blackish brown spot on apical third, an oblique transverse band originating from stigma extending to ventral margin. Hind tibiae yellowish brown and abdominal sternites blackish brown.

**Head and thorax.** Vertex (Fig. 3A, C) broad, 1.9 times wider than long; anterior margin arched convex, posterior margin slightly arched concave; median carina distinct and complete. Frons (Fig. 3D) 0.6 times as long as wide, median carina indistinct, extending from slightly above level of lateral ocelli to median ocellus. Clypeus with median carina distinct and elevated throughout. Pronotum (Fig. 3C) 1.4 times longer than vertex, posterior margin concaved in obtuse angle. Mesonotum 1.6 times longer than pronotum and vertex combined. Forewing (Fig. 3E) 1.9 times longer than wide, with nine apical and five subapical cells; fork Sc+RP slightly distad of fork CuA1+CuA2; first crossvein r-m slightly distad of fork MP; RP 2 branches, MP with four terminals: MP 1, MP2, MP3, and MP4, fork MP1+MP2 almost at same level as fork MP3+MP4. Hind tibia with three lateral spines, six apical spines; chaetotaxy of hind tarsus: 7/7, second segment of hind tarsus with three platellae.

**Male genitalia.** Pygofer (Fig. 3F, G) symmetrical, dorsal margin concave and U-shaped ventrally, widened towards apex; in lateral view, lateral lobes arched extended caudally. Medioventral process triangular in ventral view. Anal segment (Fig. 3F, H) long, tubular, asymmetrical, apical lobes arched extended ventrally in lateral view, left lobe larger than right one, 2.8 times longer than wide in dorsal view; anal style finger-like, not beyond anal segment. Gonostyli (Fig. 3F, G, I) symmetrical in ventral view; in inner lateral view, apical part extended, apical margin acute. Aedeagus (Fig. 3J–M) in total with four processes. Right side of periandrium with a long spinose process apically, straight for most portion, directed dorsocephalically, apex curved downwards and directed ventrocephalically; left side of periandrium apically with two medium-sized spinose processes, the upper one strongly curved and directed dorsally and the other one slightly curved and directed cephalad. Base of periandrium ventrally with several saw-like teeth. Endosoma slender, structure simple, apically with a small spinose process on left margin.

Scale bars: 0.5 mm.

Female genitalia. Tergite IX (Fig. 4A, B, D) moderately sclerotized, with two connected wax plates, nearly oval. Anal segment (Fig. 4C) rectangular, 1.4 times wider than long in dorsal view, anal style strap-like. Gonapophysis VIII (Fig. 4E) elongate, and slightly curved upwards. Gonapophysis IX (Fig. 4F) with two middle teeth, distance ratio between distal middle tooth to apex and length of denticulate portion is 2.4. Gonoplac (Fig. 4G) rod-like, 3.8 times longer than wide in lateral view. Posterior vagina pattern as shown in Figure 4H, I.

Distribution. China (Yunnan).
Two new species of the genus *Betacixius* Matsumura from China

**Etymology.** The specific name, derived from Latin word meaning the broadest, refers to the forewing with an extremely broad band at apex.

**Remarks.** Male genitalia of *B. latissimus* sp. nov. is similar to *B. herbaceus* Tsaur & Hsu, 1991, but differs in: (1) left side of periandrium with two spinose processes (in *B. herbaceus*, left side of periandrium with one spinose process); (2) spinose process on right of periandrium curved downwards (in *B. herbaceus*, spinose process in the same position curved upwards); (3) anal segment asymmetrical (the latter symmetrical); (4) forewing with one blackish brown spot and two bands (the latter without any marking).

1.7 times longer than pronotum and vertex combined. Forewing (Fig. 6E) 2.5 times longer than wide, with nine apical and five subapical cells; fork Sc+RP distad of fork CuA1+CuA2; first crossvein r-m almost at same level as fork MP; RP 2 branches, MP with four terminals: MP 1, MP2, MP3, and MP4, fork MP1+MP2 distad of fork MP3+MP4. Hind tibia with three lateral spines, six apical spines; chaetotaxy of hind tarsi: 7/7, second segment of hind tarsus with three platellae.

**Male genitalia.** Pygofer (Fig. 6F, G) symmetrical, dorsal margin concave and U-shaped ventrally, widened towards apex; in lateral view, lateral lobes triangularly extended caudally. Medioventral process triangular in ventral view. Anal segment (Fig. 6F, H) long tubular, symmetrical, apical lobes ventrally pointed, 2.1 times longer
Two new species of the genus *Betacixius* Matsumura from China

than wide in dorsal view; anal style strap-like, not extending beyond anal segment. Gonostyli (Fig. 6F, G, I) symmetrical in ventral view; in inner lateral view, apical part extended, apical part rounded. Aedeagus (Fig. 6J–M) with three processes. Right side near ventral margin of periantrum apically with a long spinose process, nearly straight, apex directed cephalad; left side near dorsal margin of periantrum with a shorter spinose process curving upwards, apex right-dorsally directed. Base of periantrum ventrally with several saw-like teeth. Endosoma slender, structure simple, apically with a small hook-like spinose process.

**Female genitalia.** Tergite IX (Fig. 7A, B, D) moderately sclerotized, with a large, nearly dumbbell-shaped wax plate. Anal segment (Fig. 7C) rectangular, 1.1 times longer than wide in dorsal view, anal style finger-like. Gonapophysis VIII (Fig. 7E) elongate, and slightly curved upwards. Gonapophysis IX (Fig. 7F) with two middle teeth, distance ratio between distal middle tooth to apex and length of denticulate portion is 2.0. Gonoplac (Fig. 7G) rod-like, 3.8 times longer than wide in lateral view. Posterior vagina pattern as shown in Figure 7H, I.

**Distribution.** China (Yunnan).

**Etymology.** The species name is derived from Maguan County, Yunan Province, where the type locality is located.

**Remarks.** Male genitalia of *B. maguanensis* sp. nov. is similar to *B. flagellihamus* Zhang & Chen, 2011, but differs in: (1) spinose process on right of periantrum nearly straight, directed cephalad (in *B. flagellihamus*, spinose process on right of periantrum curving dorsally); (2) apical lobes of anal segment pointed ventrally (the latter rounded); (3) forewing without ocellate marking (the latter with a large ocellate marking in apical half).

*Betacixius sparsus* Tsaur & Hsu, 1991

Figure 8A–I

*Betacixius sparsus* Tsaur and Hsu in Tsaur et al. 1991: 46, fig. 23A–E.

**Material examined.** China: 20♂♂ 56♀♀, Guangxi Province, Wuming County, Daming Mountain (23°27’N, 108°27’E), 14–15 May 2012, Zhi-Hua Fan, Hu Li, Nan-nan Yang; 11♂♂ 11♀♀, Guangxi Province, Wuming County, Daming Mountain, 14–17 May 2011, Xiao-Fei Yu, Rong Huang, Xin-Feng Zhang; 4♂♂ 4♀♀, Guangxi Province, Shangsi County, Shiwandashan National Forest Park (21°56’N, 108°6’E), 2–4 May 2011, Xiao-Fei Yu, Rong Huang.

**Supplementary description. Female genitalia.** Tergite IX (Fig. 8A, B, D) moderately sclerotized, with two nearly oval wax plates, separated from each other. Anal segment (Fig. 8C) rectangular, widening to apex, 1.1 times wider than long in dorsal view, anal style strap-like. Gonapophysis VIII (Fig. 8E) elongate, and slightly curved upwards. Gonapophysis IX (Fig. 8F) with two middle teeth, distance ratio between distal middle tooth to apex and length of denticulate portion is 2.3. Gonoplac (Fig. 8G) rod-like, 3.8 times longer than wide in lateral view. Posterior vagina pattern as shown in Figure 8H, I.
Figure 8. *Betacixius sparsus* Tsaur & Hsu, 1991, female A genitalia, lateral view B genitalia, ventral view C anal segment, dorsal view D tergite IX, caudal view E gonapophysis VIII and gonocoxa VIII, ventral view F gonapophysis IX, lateral view G gonoplac, inner lateral view H posterior vagina, ventral view I posterior vagina, dorsal view. Scale bars: 0.5 mm.

**Distribution.** China (Guangxi, Taiwan).

**Note.** The female genitalia of this species are described and illustrated for the first time.

**Discussion**

Prior to this study, nothing has been reported on the host plants of *Betacixius*. Nonetheless, we found these planthoppers most commonly in grass, shrubs, or on bamboo
Two new species of the genus *Betacixius* Matsumura from China

and tree leaves, at elevations up to 2600 m. Unfortunately, there is no knowledge of what plants these planthoppers really feed on, except that *B. flagellihamus* was collected on *Quercus* sp. (Fagaceae), which might be the plant on which it feeds.

Based on published data and our field surveys, the distribution of *Betacixius* is mostly restricted to the Oriental parts of China, Japan, and Vietnam, with *B. obliquus* Matsumura, 1914, occurring in both Palaearctic and Oriental regions, as the only exception (Fig. 9).

The regional studies on *Betacixius* in China are not equally efficient at finding species. To date, 23 species are known from China, of which about half that number (12 species) are known from Taiwan and only 12 species have been described from southern mainland China, which is much broader and more variant in ecological complexity compared with Taiwan. Therefore, we believe that additional comprehensive field surveys will find that the diversity of *Betacixius* in mainland China is doubtlessly richer.

**Figure 9.** Distribution records of the species from genus *Betacixius*: 1. *B. bispinus* Zhang & Chen, 2011 2. *B. brunnexus* Matsumura, 1914 3. *B. clypealis* Matsumura, 1914 4. *B. delicatus* Tsaur & Hsu, 1991 5. *B. euterpe* Fennah, 1956 6. *B. flagellihamus* Zhang & Chen, 2011 7. *B. flavovittatus* Hori, 1982 8. *B. fuscos* Tsaur & Hsu, 1991 9. *B. herbaceus* Tsaur & Hsu, 1991 10. *B. kumejimae* Matsumura, 1914 11. *B. latisimus* sp. nov. 12. *B. maculosus* Tsaur & Hsu, 1991 13. *B. maguanensis* sp. nov. 14. *B. michioi* Hori, 1982 15. *B. nelides* Fennah, 1956 16. *B. nigromarginalis* Fennah, 1956 17. *B. obliquus* Matsumura, 1914 18. *B. ocellatus* Matsumura, 1914 19. *B. pallidior* Jacobi, 1944 20. *B. rinkihonis* Matsumura, 1914 21. *B. robustus* Jacobi, 1944 22. *B. shirozu* Hori, 1982 23. *B. sparsus* Tsaur & Hsu, 1991 24. *B. tonkinensis* Matsumura, 1914 25. *B. transversus* Jacobi, 1944.
