**Abstract**

Strain FF9T was isolated in Dakar (Senegal) from a blood-culture taken from a 16-month-old child. MALDI-TOF analysis did not allow for identification. After sequencing, strain FF9T exhibited 98.18% similarity with the 16SrRNA sequence of *Paenibacillus uliginis*. A polyphasic study of phenotypic and genomic analyses showed that strain FF9T is Gram variable, catalase-positive, and presents a genome of 4,569,428 bp (one chromosome but no plasmid) with 4,427 genes (4,352 protein-coding and 75 RNA genes (including 3 rRNA operons). The G+C content is 45.7%. On the basis of these genomic and phenotypic data analyses, we propose the creation of *Paenibacillus dakarensis* strain FF9T.

**Introduction**

*Paenibacillus* species were originally classified within the *Bacillus* genus [1]. Members of this genus are often Gram variable, facultatively anaerobic, and endospore forming. These bacteria are frequently isolated from environments such as soil, water, vegetable matter, forage, larvae and insects but could be detected from clinical samples [2–4]. Bacteria belonging to this genus are able to produce polysaccharide-degrading enzymes and proteases [5], are beneficial to agriculture and horticulture and have industrial and medical applications [6]. Some species of this genus may be involved in human infections [7–10].

Currently this genus includes 165 validly published species and four subspecies [11].

Recently high-throughput genome sequencing and matrix-assisted laser desorption/ionization time-of-flight mass spectrometry (MALDI-TOF) analyses of bacteria have given unprecedented access to an abundance of genetic and proteomic information [12,13]. Thus, a polyphasic approach is currently proposed to describe new bacterial taxa that includes their genome sequence, MALDI-TOF spectrum and major phenotypic characteristics such as Gram staining, culture, metabolic characteristics, habitat and, if applicable, pathogenicity [14].

The strain FF9⁷ (CSUR P1429 = DSM 29777) was isolated from a blood culture of a 16-month-old child presenting at the Hôpital Principal de Dakar, Senegal. Strain FF9⁷ is a Gram-variable bacterium, facultatively anaerobic, motile and rod shaped.

Here we present a summary classification and a set of features for *Paenibacillus dakarensis* sp. nov., together with a description of the complete genome sequencing and annotation.
These characteristics support the circumscription of the species *Paenibacillus dakarensis*.

### Classification and features

In March 2014 a blood culture was performed on a 16-month-old child presenting at the Hôpital Principal de Dakar, Senegal. Strain FF9T (Table 1) was isolated from this blood culture by culture on 5% sheep–enriched Columbia agar (bioMérieux, Marcy l’Etoile, France). Identification was not obtained using MALDI-TOF because the scores obtained by this strain were low [23].

Moreover, strain FF9 exhibited 98.18% 16S rRNA sequence similarity with *Paenibacillus uliginis* [24] (GenBank accession no. FN56467), the phylogenetically closest bacterial species with standing in nomenclature (Fig. 1). These values were lower than the 98.7% 16S rRNA sequence threshold recommended by Meier-Kolthoff et al. [25] in 2013 to delineate a new species within the *Firmicutes* phylum without carrying out DNA-DNA hybridization. Different growth temperatures (25, 28, 37, 45°C and 56°C) were tested. Growth was obtained between 28 and 37°C, with optimal growth occurring at 37°C. Growth of the strain was also tested under anaerobic and microaerophilic conditions using GENbag anaer and GENbag microaer systems (bioMérieux), respectively, and under aerobic conditions, with or without 5% CO2. Optimal growth was observed under aerobic conditions, but weak growth was observed under anaerobic and microaerophilic conditions. Strain FF9 shows transparent, white, small colonies on 5% sheep’s blood–enriched Columbia agar (bioMérieux) approximately 1 mm in diameter. A motility test was positive. Cells are Gram-variable, endospore-forming rods with rounded ends (Fig. 2) and have a mean diameter of 0.6 μm (range, 0.5–0.7 μm) and a mean length of 2.8 μm (range, 2.1–3.5 μm) (Fig. 3).

*Paenibacillus dakarensis* is catalase positive and oxidase negative. Using an API 50CH strip (bioMérieux), positive reactions were observed for α-ribose, α-glucose, α-mannose, N-acetyl-α-glucosamine, amygdalin, esculin, α-cellobiose, α-lactose, α-saccharose, α-trehalose, α-melezitose, gentiobiose and α-lxose. Using a API ZYM strip (bioMérieux), negative reactions were observed for esculin, β-galactosidase, glucose and mannose. Using a API ZYM strip (bioMérieux), negative reactions were observed for alkaline phosphatase, esterase, esterase-lipase, leucine arylamidase, acid phosphatase, naphthol-AS-BI-phosphohydrolase, cystine arylamidase, valine arylamidase, trypsin, α-glucosidase, β-glucosidase, α-galactosidase, β-galactosidase, β-glucuronidase, α-mannosidase, α-fucosidase and N-acetyl-β-glucosaminidase. Strain FF9T is susceptible to amoxicillin/clavulanic acid, ticarcillin, ceftriaxone, cefalotin, imipenem, gentamicin and doxycycline but is resistant to penicillin, metronidazole and trimethoprim/sulphamethoxazole. The minimum inhibitory concentrations (MICs) for some antibiotics tested by *Paenibacillus dakarensis* strain FF9T sp. nov. are listed in Table 2.

A comparison of phenotypic characteristics with *Paenibacillus polymyx* [1], *Paenibacillus massiliensis* and *Paenibacillus sanguinis* [26] is summarized in Table 3.

MALDI-TOF protein analysis was performed using a Microflex LT (Bruker Daltonics, Leipzig, Germany), as previously reported [27,28]. The scores previously established by Bruker to identify or validate species compared to the instrument’s database were applied. In short, a score ≥2.000 with a species with a validly published name allows for identification at the species level; a score ≥1.700 and <2.000 allows for identification at the genus level; and a score <1.700 does not allow for any identification to be made. We performed 12 distinct deposits from 12 isolated colonies of strain FF9T. Two microlitres of matrix solution (saturated solution of α-cyano-4-hydroxycinnamic acid) in 50% acetonitrile and 2.5% trifluoroacetic acid were distributed on each smear and subjected to air drying for 5 minutes. The spectra from the 12 different colonies

### Table 1. Classification and general features of *Paenibacillus dakarensis* strain FF9T

| MIGS ID | Property | Term | Evidence code |
|---------|----------|------|---------------|
| Current classification | Domain: Bacteria | TAS [15] |
| Phylum: Firmicutes | TAS [16,17] |
| Class: Firmicutes | TAS [18,19] |
| Order: Bacillales | TAS [15–20] |
| Family: Paenibacillaceae | TAS [18–21] |

MIGS, minimum information about a genome sequence.

* Evidence codes are as follows: IDA, inferred from direct assay; TAS, traceable author statement (i.e. a direct report exists in the literature); NAS, nontraceable author statement (i.e. not directly observed for the living, isolated sample, but based on a generally accepted property for the species or unnoted data). These evidence codes are from the Gene Ontology project (http://www.geneontology.org/GO.evidence.shtml) [22]. If the evidence code is IDA, then the property should have been directly observed, for the purpose of this specific publication, for a live isolate by one of the authors, or by an expert or reputable institution mentioned in the acknowledgments.
were then imported into the MALDI BioTyper 2.0 software (Bruker) and analysed by standard pattern matching (with default parameter settings) against the main spectra of 6252 bacteria. Scores ranging from 1.225 to 1.456 were obtained for the FF9T, suggesting that this strain was not a member of any known species. The reference mass spectrum from strain FF9T was incremented in our database (Fig. 4). The gel view highlighted spectrum differences with other Paenibacillaceae species (Fig. 5).
TABLE 2. Antimicrobial susceptibility and MIC values of 
Paenibacillus dakarensis strain FF9T sp. nov.

| Antibiotic               | MIC (mg/L) | Interpretation |
|--------------------------|------------|----------------|
| Amoxicillin              | 2          | Susceptible    |
| Amoxicillin/clavulanic acid | 2        | Susceptible    |
| Ticarcillin              | 2          | Susceptible    |
| Ceftriaxone              | 0.5        | Susceptible    |
| Imipenem                 | 0.125      | Susceptible    |
| Ciprofloxacin            | 1          | Susceptible    |
| Gentamicin               | 1          | Susceptible    |
| Doxicycline              | 0.06       | Susceptible    |

MIC, minimum inhibitory concentration.

Genome sequencing information

Genome project history

The organism was selected for sequencing on the basis of its phylogenetic position, 16S rRNA similarity and phenotypic differences with other members of the Paenibacillaceae family. There are more than 15 genomes for the Paenibacillus genus available in public genomic collections. Here we present the first Paenibacillus dakarensis sp. nov. genome. The GenBank accession number is CDSE01000001, and it consists of 102 contigs. Table 4 shows the project information and its association with minimum information about a genome sequence (MIGS) 2.0 compliance [29].

Growth conditions and DNA isolation

Paenibacillus dakarensis strain FF9T (= CSUR P1429 = DSM 29777) was grown on 5% sheep’s blood–enriched Columbia agar (bioMérieux) at 37°C. Bacteria grown on four petri dishes were resuspended in 5 × 100 μL of Tris-EDTA (TE) buffer; 150 μL of this suspension was diluted in 350 μL TE buffer 10×, 25 μL proteinase K and 50 μL sodium dodecyl sulfate for lysis treatment. This preparation was incubated overnight at 56°C. Extracted DNA was then purified using three successive phenol–chloroform extractions and ethanol precipitations at −20°C overnight. After centrifugation, DNA was suspended in 65 μL Elution buffer (EB) buffer. The genomic DNA concentration was measured at 452.7 ng/μL using the Qubit assay with the high sensitivity kit (Life Technologies, Carlsbad, CA, USA).

Genome sequencing and assembly

The mate pair library was prepared with 1.5 μg of genomic DNA using the Nextera mate pair Illumina guide (Illumina, San Diego, CA, USA). The genomic DNA sample was simultaneously fragmented and tagged with a mate pair junction adapter. The pattern of fragmentation was validated on an Agilent 2100 BioAnalyzer (Agilent Technologies, Santa Clara, CA, USA) using a DNA 7500 lab chip. The DNA fragments ranged in size from 1.5 to 11 kb, with an optimal size of 5.773 kb. No size selection was performed, and 600 ng of fragmented DNA were circularized. The circularized DNA was mechanically sheared into small fragments with an optimal size of 932 bp on the Covaris device S2 in T6 tubes (Covaris, Woburn, MA, USA). The library profile was visualized on a High Sensitivity Bioanalyzer LabChip (Agilent), and the final concentration library was measured at 19.07 nmol/L.

TABLE 3. Differential characteristics of Paenibacillus dakarensis strain FF9T (data from this study) with Paenibacillus polymyxa [1], Paenibacillus massiliensis [26] and Paenibacillus sanguinis [26]

| Character                        | Paenibacillus dakarensis | Paenibacillus uliginis | Paenibacillus polymyxa | Paenibacillus massiliensis | Paenibacillus sanguinis |
|----------------------------------|--------------------------|------------------------|------------------------|---------------------------|------------------------|

+, positive result; −, negative result; (+/−), strain-dependent reaction; v, variable result; NA, data not available.
The libraries were normalized at 2 nM and pooled. After a denaturation step and dilution at 15 pM, the pool of libraries was loaded onto the reagent cartridge and then onto the instrument along with the flow cell. Automated cluster generation and sequencing runs were performed in a single 39-hour run in a 2 × 251 bp read length.

Total information of 4.9 Gb was obtained from a 506K/mm² cluster density with a cluster passing quality control filters of 97% (9 954 000 clusters). Within this run, the index representation for Paenibacillus dakarensis FF9 was determined to be 8.98%. The 866 711 paired reads were filtered according to read quality. These reads were trimmed and then assembled.

**Genome annotation**

Open reading frames (ORFs) were predicted using Prodigal [30] with default parameters, but the predicted ORFs were excluded if they spanned a sequencing gap region. The predicted bacterial protein sequences were searched against the GenBank database [31] and the Clusters of Orthologous Groups (COGs) database using BLASTP. The tRNAScanSE tool [32] was used to find tRNA genes, while ribosomal RNAs were found using RNAmmer [33] and BLASTn against the GenBank database. Lipoprotein signal peptides and the number of transmembrane helices were predicted using SignalP [34] and TMHMM [35] respectively. ORFans were identified if their BLASTP E value was lower than 1e-03 for alignment length greater than 80 amino acids. If alignment lengths were smaller than 80 amino acids, we used an E value of 1e-05. Such parameter thresholds have been used in previous works to define ORFans. Artemis [36] was used for data management and DNA Plotter [37] for visualization of genomic features. The Mauve alignment tool (version 2.3.1) was used for multiple genomic sequence alignment [38]. To estimate the mean level of nucleotide sequence similarity at the genome level, we used the MAGI homemade software to calculate the average genomic identity of gene sequences (AGIOS) among compared genomes. Briefly, this software combines the Proteinortho software [39] for detecting orthologous proteins in pairwise

**FIG. 4.** Reference mass spectrum from Paenibacillus dakarensis strain FF9T. Spectra from 12 individual colonies were compared and reference spectrum generated.

genomic comparisons, then retrieves the corresponding genes and determines the mean percentage of nucleotide sequence identity among orthologous ORFs using the Needleman-Wunsch global alignment algorithm. Genomes from the Paenibacillus genus and closely related genera were used for the calculation of AGIOS values. The script created to calculate AGIOS values was named MAGi (Marseille Average genomic identity) and is written in Perl and Bioperl modules. Genome-to-Genome Distance Calculator (GGDC) analysis was also performed using the GGDC Web server (http://ggdc.dsmz.de) as previously reported [40,41]. Here, we compared the genome sequences of P. dakarensis strain FF9T (GenBank accession no. CDSE01000001) with those of Paenibacillus lactis strain 154 (AGIP00000000), Paenibacillus polymyxa strain ATCC 842T (AFOX00000000), Paenibacillus massiliensis strain 2301065T (ARIL00000000), Paenibacillus sabinae strain T27T (CP004078), Paenibacillus borealis strain DSM 13188T (CP009285) and Paenibacillus forsythiae strain T98T (ASSC00000000).

Genome properties
The genome of the P. dakarensis strain FF9T is 4,569,428 bp long with a 45.7% G+C content (Fig. 6). Of the 4,427 predicted genes, 4,352 were protein-coding genes and 75 were RNA genes. Six rRNA genes (two 16S rRNA, two 23S rRNA and two 5S rRNA) and 69 predicted tRNA genes were identified in the genome. A total of 2,820 genes (63.70%) were assigned a putative function. A total of 128 genes were identified as ORFans (2.89%). The remaining genes were annotated as hypothetical proteins. The properties and the statistics of the genome are summarized in Table 5. The distribution of genes into COGs functional categories is presented in Table 6.
Insights from genome sequence

Genomic comparison with other *Paenibacillus* species

The draft genome of *P. dakarensis* is smaller than that of *P. lactis, P. polymyxa, P. massiliensis, P. sabinae, P. borealis* and *P. forsythiae* (4.56, 6.81, 5.9, 6.39, 5.27, 8.16 and 5.08 Mb, respectively). The G+C content of *P. dakarensis* is higher than those of *P. polymyxa* (45.7% vs 40.75%).

COGs, Clusters of Orthologous Groups database.

*Total is based on total number of protein-coding genes in annotated genome.*
(45.7 and 44.9%, respectively) but lower than those of *P. lactis*, *P. massiliensis*, *P. sabinae*, *P. borealis* and *P. forsythiae* (49.1, 48.5, 52.6, 51.4 and 52.9 respectively). The gene content of *P. dakarensis* is lower than those of *P. lactis*, *P. massiliensis*, *P. sabinae*, *P. borealis* and *P. forsythiae* (4427, 6234, 5206, 5193, 4896, 6382 and 5103 respectively). However, the distribution of genes into COGs categories was similar in all compared genomes (Fig. 7). In addition, *P. dakarensis* shared 4352, 6149, 5068, 5055, 4788, 6213 and 5011 orthologous genes with *P. lactis*, *P. polymyxa*, *P. massiliensis*, *P. sabinae*, *P. borealis* and *P. forsythiae* respectively (Table 7). Among species with standing in nomenclature, AGIOS values ranged from 69.19% between *P. polymyxa* and *P. forsythiae* to 84.00% between *P. forsythiae* and *P. sabinae*.

**Conclusion**

On the basis of phenotypic, phylogenetic and genomic analyses, we formally propose the creation of *Paenibacillus dakarensis* sp. nov., which contains strain FF9^T_. The strain was isolated from a blood sample taken from a 16-month-old Senegalese child presenting at the Hôpital Principal de Dakar.

**Taxonomic and nomenclatural proposals**

*Paenibacillus dakarensis* (da.kar.e’n.se. L. gen. neutr. n. dakarensis, or originating from Dakar, the capital of Senegal, where the type strain was isolated). The strain FF9^T_ is a facultative anaerobic, Gram variable bacterium, with small, white colonies on 5% sheep’s blood–enriched Columbia agar. A motility test was positive. Cells have a mean diameter of 0.6 μm (range, 0.5–0.7 μm) and a mean length of 2.8 μm (range, 2.1–3.5 μm). The strain FF9^T_ is oxidase negative and catalase positive. Positive reactions were observed for D-ribose, D-glucose, D-mannose, N-acetyl-D-glucosamine, amygdaline, esculin, D-cellobiose, D-lactose, D-saccharose, D-trehalose, D-melezitose, gentiobiose, D-lyxose and β-galactosidase. *Paenibacillus dakarensis* strain FF9^T_ is susceptible to amoxicillin/clavulanic acid, ticarcillin, ceftriaxone, cefalotin, imipenem, gentamicin and doxycycline but resistant to metronidazole, penicillin and trimethoprim/sulfamethoxazole. The G+C content of the
