Figure S2 Visual predictive check of the healthy participant (phase I) popPK model for single- and multiple-dose administration.

Circles: observations; solid gray line: median of the observed letermovir concentrations; dashed lines: 2.5th and 97.5th percentiles of the prediction-corrected observed letermovir concentrations; blue dashed line: prediction-corrected median of the predictions; shaded area: the 95% prediction interval based on the
prediction-corrected 2.5th and 97.5th percentiles of the predictions. All observations and predictions are adjusted using prediction correction as described in Bergstrand et al. 2011.18

IV, intravenous; popPK, population pharmacokinetics.
