Abstract: The fishes are one of the most important vertebrates, provide rich protein sources for human and several animals and important elements in the economy of many countries. Fish diversity of river essentially represents the fish faunal diversity and their abundance. Rivers conserve a rich variety of fish species which supports the commercial fisheries. The country is rich in diversity of such important group of animals. Keeping in view, the diversity of fish fauna of the Temar River in Jabalpur District, Madhya Pradesh, India, has been studied from the period November 2013 to October 2014. The aim of the study was to explore the fish fauna of Temar River in the course of investigation, three sampling site were selected viz. Near Temar Bridge, Near Temar Fall and Near Saliwara village, Jabalpur. The total 34 fish species were recorded under 7 order and 11 families. 2 species of Clupiformes, 16 species of Cypriniformes, 8 species of Siluriformes, 1 species of Beloniformes, 3 species Ophiocephaliformes, 2 species of Perciformes and 2 species of Manta cembeliformes have been recorded. The Cyprinidae family is dominant followed by Bagridae and Ophiocephalidae. Recently, the Tor tor fish species commonly called “Mahasheer” has been declared state Fish of Madhya Pradesh. The over fishing and pollution are the major threat for fish diversity of the Temar River.

Keywords: Fish diversity, Fresh Water Fishes, Temar River, Jabalpur, Madhya Pradesh

1. Introduction

Fish constitutes half of the total number of vertebrates in the world. They live in almost all conceivable aquatic habitats; 21,723 living species of fish have been recorded out of 39,900 species of vertebrates, 8,411 are freshwater species and 11,650 are marine. India is one of the mega biodiversity countries in the world and occupies the ninth position in terms of freshwater mega biodiversity. India are 2,500 species of fishes of which 930 live in freshwater and 1,570 are marine [1].

River Temar touches Jabalpur. It originates from Palatwara village near Ghansore, district Seoni M.P. It joins Narmada River near Saliwara village, Bargi, district Jabalpur M.P. The river is the lifeline of the people resides in nearby villages mostly for various domestic activities. The peoples are catching, selling and feeding the fishes form the Temar River. The diversity of the river is still unexplored and not documented. The fresh water fishes are well studied and documented across the country [2-4].

Several renowned workers studied the fresh water fishes of rivers, ponds, lakes, dams and reservoir of the country. The fish fauna of Madhya Pradesh and Jabalpur was studied Hora [5, 6], Hora and Nair [7], Swarup [8], Dubey and Mehra [9], Soni [10, 11], Malviya [12], Dubey and Verma [13], Mathur and Mishra [14], Tilak and Sinha [15], Karmakar and Datta [16], Saxena [17], Desai [18], Desai et al. [19], Sen [20, 21], Sharma [22-24], Dwivedi et al. [25], Shukla et al. [26], Chandra et al. [27], Thilak [28, 29], Mahor [30] and Solanki et al. [31]. However, data on the fish fauna of Madhya Pradesh have limitations as most of the rivers have not surveyed extensively and checklists for individual rivers are not available. In the present study, we document the fish fauna of Temar River, Jabalpur District, Madhya Pradesh.

2. Materials and Methods

The Temar River is one of the most important river of Jabalpur and Seoni District of Madhya Pradesh. In the present study the Ichthyofaunal diversity of Temar River, was studied at three sampling site, these are Near Temar Bridge, Near Temar Fall, Near Saliwara village. The area enjoys semi-arid type of climate with mean annual precipitation of 1358 mm. Fishes were collected form Temar River near Temar Bridge, Near Temar Fall, Near Saliwara village. Fish were collected in three seasons (pre monsoon from February to May, monsoon from June to September and post monsoon form October to January) for a period of one year from November 2013 to October 2014. The fishes were collected by hand-net, cast nets (Ghagaria Jaal), local fisherman and local markets. Collected fish samples were preserved in 10% formalin solution and systematic indentified following Talwar and Jhingran [32], Jayaram [33], Day [34] and Shrivastava [35].

Visual observation were also carried out if the water was clear, to understand the distribution of fish species. The relative abundance of the fish was classified into four categories namely abundant (76-100% of total catch), Common (51-75% of the total catch), moderate (26-50% of the total catch) and rare (1-25% of the total catch), assuming the fishing efforts constant for each catch. Threat status was determined as previously reported by Molur and Walker [3].

3. Result and Discussion

During the study, total 34 species of primary freshwater fishes belonging to 7 orders, 11 families and 19 genera were recorded from the study sites. Number of species, their distribution in different study sites, threat status and relative abundance is given in Table, 1. Maximum number of species and individuals were recorded in sampling site-3 (Near
Saliwara Village) whereas low number of species and individuals were recorded in sampling site-1 (Near Temar Bridge). In the assemblage structure, cyprinid constituted the dominant group and the cyprinids Catla catla, Cirrhinus mrigula, Cyprinus carpio, Labeo rohita, Osteobrama cotto, Puntius sarana, Puntius sophore, Puntius ticto and Tor tor are represented in all study sites. The Cyprinids Labeo bata and Puntius chola represents only single location (Near Saliwara Village). In all 4 species these are Labeo bata, Puntius chola, Channa striatus, Anabas testudineus represents only single site (Near Saliwara Village) whereas 24 Fish species are recorded in all study sites and 6 Fish species there are Cirrhinus reba, Ctenopharyngodon idellus, Labeo calbasu, Labeo fimbriatus, Labeo gonius, Xiphasia cancila absent only single site (Near Temar Bridge). The family Cyprinidae dominated with 16 species followed by Bagridae with 4 species and Ophiocephalidae with 3 species besides other families as Notopteridae, Siluridae, Mastacembelidae with 2 species and Claridae, Heteropneustidae, Belonidae, Nandidae, Anabantoidei with 1 species. (Table 1). The Mahasheer, Tor tor, an endangered and highly prized sport fish is abundant and thriving well in all the three study sites and has been declared as state fish of Madhya Pradesh.

Out of the 34 species, 2 species Tor tor and Ompok bimaculatus are endangered, 8 species vulnerable, 18 species are lower risk near threatened, 1 species lower risk least concern, 2 species are exotic and 3 species are not evaluated categories (Molur and Walker [3]).

4. Conclusion

The study revealed that many species in the study area are being threatened by various human activities, invasive alien species and destructive fishing. Moreover, removal of sewage runoff into the river causes severe threats to fish diversity. Special attention is to be given for conservation of these fish diversity. The observations recorded in the present study may prove valuable as a reference for assessing the changes due to the environmental conditions in the locality, in future. The findings of the present study underline the importance of Temar River in providing preferred abode for fishes.

5. Acknowledgement

We are thankful to the Head, Department of Environmental science, Govt. Model Science College, Jabalpur (M.P.) for providing the necessary laboratory facilities and Dr. R.K. Shrivastava Prof. (Environmental Science) Dr. K.K. Dube, Professor of Zoology (Retd.) Govt. Model Science College, Jabalpur (M.P.) for their help in work of laboratory and identification of some fishes.
