Abstract

In this paper we reconsider the problem of the Euler parametrization for the unitary groups. After constructing the generic group element in terms of generalized angles, we compute the invariant measure on $SU(N)$ and then we determine the full range of the parameters, using both topological and geometrical methods. In particular, we show that the given parametrization realizes the group $SU(N+1)$ as a fibration of $U(N)$ over the complex projective space $\mathbb{CP}^n$. This justifies the interpretation of the parameters as generalized Euler angles.

1 Introduction

The importance of group theory in all branches of physics is a well-known fact. Explicit realizations of group representations are often necessary technical tools. Often it is finite dimensional and compact Lie groups and then the knowledge of the associated algebra, which describes the group in a neighborhood of the identity, is enough for this purpose.

There are however cases where an explicit expression of the full global group structure is needed, as for example when non-perturbative computations come into play. In most of these cases, the main objectives are two: First, one would like to find a relative simple parametrization, making all the computations manageable. Second, one needs to determine the full range of the parameters, in order to be able to handle global questions.

If both such points can seem unnecessary at an abstract level, they become essential at a most concrete level, e.g. in instantonic calculus or in non-perturbative lattice gauge theory computations. The necessary computer memory for simulations is in fact drastically diminished.

The case of $SU(N)$ was first considered and solved by Tilma and Sudarshan, in [1]. There, they provide a parametrization, in terms of angular parameters, for the unitary groups. In particular, in the first paper they consider special groups, $SU(N)$, together with some applications to qubit and qutrit configurations. In the second paper, they give an extension to $U(N)$ groups, using the fibration structure of $SU(N + 1)$ as $U(N)$ fiber over the complex projective space $\mathbb{CP}^n$.

In this paper we reconsider the problem of finding a generalized Euler parametrization for special unitary groups. The intent is to provide a fully explicit and elementary\(^1\) proof of the beautiful results of [1]. Our motivation is that the determination of the range of the parameters is a quite difficult task, so that disagreements are present in the literature even for $SU(3)$ (for example in [4]). Therefore, we think that a careful deduction is necessary in order to corroborate the results of Tilma and Sudarshan. Also, all our proofs based essentially on inductive procedures, and they are explicit, in order to be easily accessible to anyone who needs them.

Our construction is quite different from [1], and as a result our parametrization differs slightly from theirs. However, this doesn’t affect the final expression of the invariant measure.

To illustrate the spirit of our construction, let us start by taking a look at the Euler parametrization for $SU(2)$.

Starting from the Pauli matrices

$$
\sigma_1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \quad \sigma_2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \quad \sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix},
$$

(1.1)

it is known that the generic element of $SU(2)$ can be written as

$$
g = e^{i\phi \sigma_3} e^{i\theta \sigma_2} e^{i\psi \sigma_3}.
$$

(1.2)

Here $\phi \in [0, \pi], \theta \in [0, \pi/2], \psi \in [0, 2\pi]$ are the so-called Euler angles for $SU(2)$.

They are related to the well-known Euler angles traditionally used in classical mechanics to describe the motion of a spin. From the point of view of the structure of the representation, (1.2) is obtained starting from a one parameter subgroup $e^{i\theta \sigma_2}$ and then acting on it both from the left and from the right with a maximal subgroup of $SU(2)$ which doesn’t contain the first subgroup. We can rewrite it in

\(^1\)which doesn’t means short!
the schematic form $g = U(1) \exp(i\theta \sigma_2) U(1)$. On the other hand, the group $SU(2)$ is topologically equivalent to the three-sphere $S^3$, and admits a Hopf fibration structure with fiber $S^1$ over the base $S^2 \simeq \mathbb{CP}^1$.

To recognize this fibration structure in (1.2), we can apply the methods used in [2, 5]. After introducing the metric $(A|B) = \frac{1}{2} Tr(AB)$ on the algebra, the metric on the group can be computed as $ds^2 = J \otimes J$, where $J = -ig^{-1}dg$ are the left-invariant currents. Following [2], it is possible to separate the fiber from the base by writing $g = hU(1)$, where $h = e^{i\phi \sigma_3} e^{i\theta \sigma_2}$ and $U(1) = e^{i\psi \sigma_3}$. To find the metric on the fiber, let’s fix the point on the base and compute the currents along the fiber, $J_F = -iU(1)^{-1}dU(1) = d\psi \sigma_3$. The metric on the fiber is then simply given by $ds^2_F = d\psi^2$. To determine the metric on the base, we first have to project out from the current $J_B = -ih^{-1}dh$ the component along the fiber, in order to be left with the reduced current on the basis $J_B = d\psi \sigma_2 + \sin(2\psi) d\psi \sigma_1$, which then in turn provides the metric

$$ds^2_B = \frac{1}{4} [d(2\psi)^2 + \sin^2(2\psi) d(2\phi)^2] . \quad (1.3)$$

This corresponds in fact with the metric of a sphere of radius $\frac{1}{2}$. It is easy to see that, introducing the complex coordinates $z = \tan(\psi e^{i\phi})$ and their complex conjugates, the metric $ds^2_B$ reduces to the standard Fubini-Study metric for $\mathbb{CP}^1$.

This shows that the Euler parametrization captures the Hopf fibration structure of $SU(2)$, which is the starting point for our construction. Mimicking what we said about $SU(2)$, let’s write the generic element of $SU(N+1)$ as $g = U(N)e(\theta) U(N)$, where $e(\theta)$ is a one parameter subgroup not contained in $U(N)$. The first difficulty we have to face here is that this expression for a generic $SU(N+1)$ group has redundancies, which have to be eliminated. After this problem is solved, we then have to show that the parametrization respects the Hopf fibration structure of $SU(N+1)$.

## 2 The $SU(N)$ algebra

The generators of $su(N)$ are all the $N \times N$ traceless hermitian matrices. A convenient choice for a base are the generalized Gell-Mann matrices as explained in [1]. Let’s remind how they can be constructed using an inductive procedure. Let be $\{\lambda_i\}_{i=1}^{N^2-1}$ the Gell-Mann base for $su(N)$: They are $N \times N$ matrices which can be embedded in $su(N+1)$ adding a null column and a null row

$$\lambda_i = \begin{pmatrix} \lambda_i & 0 \\ 0 & 0 \end{pmatrix} . \quad (2.1)$$

We will omit the tilde from now on. The dimension of $SU(N)$ being $(N+1)^2 - 1$, we must add $2N + 1$ matrices to obtain a Gell-Mann base for $su(N+1)$. This can be done as follows: Put

$$\{\lambda_{N^2+2a-2}\}_{a=1}^{N^2-1} = \begin{pmatrix} \delta_{\alpha,a} \delta_{\beta,N+1} + \delta_{\alpha,N+1} \delta_{\beta,a} \\ i(-\delta_{\alpha,a} \delta_{\beta,N+1} + \delta_{\alpha,N+1} \delta_{\beta,a}) \end{pmatrix} , \quad (2.2)$$

for $a = 1, \ldots, N$. The last matrix we need is diagonal and traceless so that we can take $\lambda_{(N+1)^2-1} = \epsilon_{N+1} \text{diag}\{1, \ldots, 1, -N\}$.

One can easily verify that the base of matrices $\{\lambda_i\}_{i=1}^{(N+1)^2-1}$ so obtained satisfies the normalization
condition $\text{Trace}\{\lambda_I \lambda_J\} = 2\delta_{IJ}$ if we choose $\epsilon_{N+1} = \sqrt{\frac{2}{(N+1)^2-(N+1)}}$. These are exactly the matrices we need to generate the group elements.

3 The Euler parametrization for $SU(N+1)$: Inductive construction

It is a well known fact that special unitary groups $SU(N+1)$ can be geometrically understood as $U(N)$ fibration over the complex projective space $\mathbb{CP}^N$. Now $U(N)$ is generated by the first $N^2 - 1$ generalized Gell-Mann matrices plus the last one $\lambda_{(N+1)2}$. Using the fact that all the remaining generators of $SU(N+1)$ can be obtained from the commutators of these matrices with $\lambda_{N^2+1}$, one is tempted to write the general element of $SU(N+1)$ in the form

$$SU(N+1) = U(N)e^{i\pi N^2+1}U(N).$$

(3.1)

However to describe $SU(N+1)$ we need $(N+1)^2 - 1$ parameters, while in the r.h.s. they are $2N^2 + 1$: There are $(N - 1)^2$ redundancies. Inspired at first by dimensional arguments, we propose that an $U(N)$ subgroup can be subtracted from the left $U(N)$ in the following way.

Let us write $U(N)$ in the form $U(N) = SU(N)e^{i\phi \lambda_{(N+1)2}}$. Inductively, we can think that also $SU(N)$ can be recovered from $U(N-1)e^{i\phi \lambda_{(N-1)2}+1}U(N-1)$ eliminating the redundant parameters, so that it will have the form $SU(N) = he^{i\phi \lambda_{(N-1)2}+1}SU(N-1)e^{i\theta \lambda_{N-2}+1}$. We then choose to eliminate the appearing $SU(N-1)$ together with the phase $e^{i\phi \lambda_{(N+1)2}-1}$. In this way the $SU(N+1)$ group element can be written in the form $SU(N+1) = he^{i\phi \lambda_{(N-1)2}+1}e^{i\theta \lambda_{N-2}+1}e^{i\pi N^2+1}U(N)$. By induction, assuming $N \geq 2$ we arrive to the final form of our Ansatz about the parametrization of the general element $g \in SU(N+1)$

$$g = e^{i\theta_1 \lambda_3}e^{i\phi_1 \lambda_2} \prod_{a=2}^{N} e^{i\theta_a \lambda_{2a-1}}e^{i\phi_a \lambda_{2a+1}}U(N)[\alpha_1, \ldots, \alpha_{N+2}],$$

(3.2)

where $U(N)[\alpha_1, \ldots, \alpha_{N+2}]$ is a parametrization of $U(N)$ which in turn can be obtained inductively using the fact

$$U(N) = [SU(N) \times U(1)])/\mathbb{Z}_N.$$  

(3.3)

The Ansatz (3.2) contains the correct number of parameters. However, we need to show that it is a good Ansatz, meaning that at least locally it has to generate the whole tangent space to the identity. Using the Backer-Campbell-Hausdorff formula and some properties of the Gell-Mann matrices, it is easy to show that

$$e^{i\theta_1 \lambda_3}e^{i\phi_1 \lambda_2} \prod_{a=2}^{N} e^{i\theta_a \lambda_{2a-1}}e^{i\phi_a \lambda_{2a+1}} = e^{i\sum_{j=1}^{(N+1)^2-2} a_j \lambda_j},$$

(3.4)

where $a_j$ are all non vanishing functions of the $2N$ parameters $\theta_a, \phi_a$. Thus in a change of coordinates (from the $\theta_a, \phi_a$ to the $a_j$) only 2N of the $a_j$ can be chosen as independent parameters. We

---

2Essentially the fact that the commutators of $\lambda_{(k-1)^2+1}$ with the first $(k-1)^2 - 1$ matrices generate all the remaining matrices of the $su(k)$ algebra but the last one
could choose the last ones, corresponding to the coefficients of the matrices \( \{ \lambda_k \}_{k=N^2+2N-1} \). In this way, the \( N^2 \) free parameters for the remaining matrices come out exactly from the \( U(N) \) factors in (3.2).

We have not entered into details here because a second simple proof of the validity of this parametrization will be given by constructing a nonsingular invariant measure from our Ansatz.

4 Invariant measure and the range of the parameters

4.1 The invariant measure

To construct the invariant measure for the group starting from (3.2), we will adopt the same method used in [2], with \( U := U(N) \) as the fiber group. Let us then write (3.2) as

\[
g = h \cdot U .
\]

Starting from the computation of the left invariant currents \( j_h = -ih^{-1}dh \), we can define the one forms

\[
e^l := \frac{1}{2} Tr \left[ j_h \cdot \lambda_{N^2+l-1} \right], \quad l = 1, \ldots, 2N,
\]

which turns out to give the Vielbein one forms of the base space of the fibration. If \( e \) denotes the corresponding Vielbein matrix, the invariant measure for \( SU(N+1) \) will then take the form

\[
d\mu_{SU(N+1)} = \det e \cdot d\mu_{SU(N)} ,
\]

\( d\mu_{SU(N)} \) being the invariant measure for \( U(N) \). Using (3.3) with \( U(1) = e^{\frac{2\pi i}{N+1} \lambda_{(N+1)^2-1}} \) we obtain the recursion relation

\[
d\mu_{SU(N+1)} = \det e \cdot d\mu_{SU(N)} \frac{d\omega_{N+1}}{\epsilon_{N+1}} .
\]

Then we will concentrate on the \( \det e \) term. To this end let us write (3.2) in the form

\[
g = h_{N+1}[\theta_a, \phi_a] \cdot U[\alpha_i] .
\]

Here we will consider \( N \geq 3 \) so that the relation

\[
h_{N+1} = h_N e^{\frac{2\pi i}{N} \lambda_{N^2-1} e^{i\phi_N \lambda_{N^2+1}}} ,
\]

is true. If we introduce the right currents \( J_{h_{N+1}} = -ih_{N+1}^{-1}dh_{N+1} \) then the Vielbein (4.2) takes the form

\[
e^{(N)}_l = \frac{1}{2} Tr \left[ J_{h_{N+1}} \lambda_l \right] = d\phi_N \delta_{l,N^2+1} + \frac{1}{2\epsilon_N} d\theta_N Tr \left\{ e^{-i\phi_N \lambda_{N^2+1} \lambda_{N^2-1} e^{i\phi_N \lambda_{N^2+1} \lambda_{N^2+l}}} \right\}
\]

\[
+ \frac{1}{2} Tr \left\{ e^{-i\phi_N \lambda_{N^2-1} J_{h_{N+1}} e^{i\phi_N \lambda_{N^2+1} \lambda_{N^2+1} e^{i\phi_N \lambda_{N^2+1} \lambda_{N^2+l}}} \right\} ,
\]

\[3^{\text{Note that here } \omega \text{ is allowed to vary in the range } [0, 2\pi/N].}\]
and using the relations in appendix A we find

$$
e^{(N)} = \begin{pmatrix}
d\phi_N & 0 & 0 \\
0 & \sin \phi_N \cos \phi_N d\theta_N & \sin \phi_N \cos \phi_N \\
0 & 0 & \frac{1}{2} \sin \phi_N Tr \left[ e^{-i\frac{\phi_N}{N} \lambda_{N^2-1} J_{h_N} e^{i\frac{\phi_N}{N} \lambda_{N^2-1} M}} \right]
\end{pmatrix}
$$

where we introduced the \{N\} index to indicate that this is a $2N \times 2N$ matrix associated to the group $SU(N+1)$. Here $M$ is a column of matrices, $M_{2j-1} = \lambda_j^2 + 1$, $M_{2j} = \lambda_j^2$, $j = 1, 2, \ldots, N - 1$. Formula (4.8) then reads as follows: $J_{h_N}$ is a 1-form with components $J_{h_N,c}$, $c = 1, 2, \ldots, 2n - 2$, with respect to the coordinates $X^c$, defined as $X^{2j-1} = \theta_j$, $X^{2j} = \phi_j$. To find the component $(r,c)$ of (4.8) one must then take the $c$–th component of $J_{h_N,c}$ and the $r$–th component of $M$ before to compute the trace.

The invariant measure is then

$$d\text{te}_{\{N\}}^{(N)} = d\phi_N d\theta_N \cos \theta_N \sin^{2N-1} \phi_N \det \left( \frac{1}{2} Tr \left[ e^{-i\frac{\phi_N}{N} \lambda_{N^2-1} J_{h_N} e^{i\frac{\phi_N}{N} \lambda_{N^2-1} M}} \right] \right).$$

We now use the recurrence relation

$$J_{h_N} = \lambda_{(N-1)^2+1} d\phi_{N-1} + \frac{1}{\epsilon_{N-1}} e^{-i\phi_{N-1} \lambda_{(N-1)^2+1}} \lambda_{(N-1)^2-1} e^{i\phi_{N-1} \lambda_{(N-1)^2-1}} d\theta_{N-1} + e^{-i\phi_{N-1} \lambda_{(N-1)^2+1}} e^{-i\frac{\phi_{N-1}}{N-1} \lambda_{(N-1)^2-1}} J_{h_{N-1}} e^{i\frac{\phi_{N-1}}{N-1} \lambda_{(N-1)^2-1}} e^{i\phi_{N-1} \lambda_{(N-1)^2+1}}.$$

Computing the traces different cases arise depending on whether $j = N - 1$ or $j < N - 1$; using again the relations in appendix A it is not too difficult to show that the last determinant is equal to

$$\det \left( \frac{d\phi_{N-1} \cos (N\theta_N)}{d\phi_{N-1} \sin (N\theta_N)} \right) \frac{-\frac{1}{2} \sin (N\theta_N) \sin (2\phi_{N-1}) d\theta_{N-1}}{\frac{1}{2} \cos (N\theta_N) \sin (2\phi_{N-1}) d\theta_{N-1}} \times \det \left( \frac{1}{2} \cos \phi_{N-1} Tr \left[ e^{-i\frac{\phi_{N-1}}{N-1} \lambda_{(N-1)^2-1} J_{h_{N-1}} e^{i\frac{\phi_{N-1}}{N-1} \lambda_{(N-1)^2-1} M}} \right] \right),$$

which put into (4.9) in turn yields the recurrence relation

$$d\text{te}_{\{N\}}^{(N)} = d\phi_N d\theta_N \sin^{2N-1} \phi_N \frac{\sin^{2N-1} \phi_N}{\tan^{2N-4} \phi_{N-1}} d\text{te}_{\{N-1\}}.$$
4.2 The range of the parameters

At this point we are able to determine the range of the parameters in such a way as to cover the whole group. We will do this only for the base space: The remaining ranges for the fiber can be determined recursively, as discussed above, remembering in particular that the $U(1)$ phase in $U(k)$ can be taken in $[0, 2\pi/k]$.

We then proceed as in [2]. We first choose the ranges so as to generate a closed $((N + 1)^2 - 1)$–dimensional closed manifold which then has to wrap around the group manifold of $SU(N + 1)$ an integer number of times. This can be done by looking at the measure (4.12) on the base manifold and noticing that it is non singular when $0 < \phi_a < \frac{\pi}{2}$, whereas $\theta_a$ can take all the period values $\theta_a \in [0, 2\pi]$, for all $a = 1, \ldots, N$. However, note that the angles $\theta_1, \phi_1, \theta_2$ generate the whole $SU(2)$ group when $0 \leq \theta_1 \leq \pi$, $0 < \phi_a < \frac{\pi}{2}$ and $0 \leq \theta_2 \leq 2\pi$. We can then restrict $\theta_1 \in [0, \pi]$. The rest of the variety is generated by the remaining $U(N)$ part.

If we call $V_{N+1}$ the manifold obtained this way we then find

$$Vol(V_{N+1}/U(N)) = \int_0^\pi d\theta_1 \prod_{a=2}^N \int_0^{2\pi} d\theta_a \prod_{b=1}^N \int_0^{\frac{\pi}{2}} d\phi_b \left\{ \cos \phi_N \sin^{2N-1} \phi_N \prod_{c=1}^{N-1} [\sin \phi_c \cos^{2c-1} \phi_c] \right\}$$

or equivalently

$$Vol(V_{N+1}) = Vol(U(N)) \frac{\pi^N}{N!}.$$

This is exactly the recursion relation found in App. B. Therefore, it is the correct range of the parameters for every $N \geq 2$, if we have $V_3 = SU(3)$, as can be easily checked directly or by comparison with the results given in appendix A of [4].

The next step is to determine the parametrization of $SU(N + 1)$ for every value of $N$. It is given by (3.2) with

$$0 \leq \theta_1 \leq \pi, \quad 0 \leq \theta_a \leq 2\pi, \quad a = 2, \ldots, N$$

$$0 \leq \omega \leq \frac{2\pi}{N}, \quad 0 \leq \phi_a \leq \frac{\pi}{2}, \quad a = 1, \ldots, N,$$

and the remaining parameters which cover $SU(N)$ (determined inductively).

To prove that our parametrization is well-defined we can do more: We are in fact able to show that the induced metric on the base manifold is exactly the Fubini-Study metric over $\mathbb{CP}^N$.

5 The geometric analysis of the fibration

We will now show that the metric induced on the base space takes exactly the form of the Fubini-Study metric in trigonometric coordinates as given in appendix C. To do so we will again use inductive arguments.

The metric on the base is $ds^2_B = [e^{(N)}]^T \otimes e^{(N)}$, where $T$ indicates transposition and $e^{(N)}$ is given

\[\text{(4.13)}\]

\[\text{(4.14)}\]
in (4.8). Using the relations in appendix A and defining

\[ X_N = \frac{1}{2} \sum_{\alpha=2}^{N} \text{Tr} \left[ J_{rN} e_{\alpha} \lambda_{\alpha^2-1} \right] \quad (5.16) \]

the metric takes the form

\[
\begin{align*}
    ds_B^2 &= d^2 \phi_N + \sin^2 \phi_N \left\{ |d\theta_N + X_N|^2 + \sum_{j=1}^{N-1} \left[ \frac{1}{2} \text{Tr} \left( e^{-\frac{\theta_N}{N} \lambda_{N^2-1}} J_{rN} e^{\frac{\theta_N}{N} \lambda_{N^2-1}} \right) \lambda_j \right]^2 \right. \\
    &\quad \quad \left. + \sum_{j=1}^{N-1} \left[ \frac{1}{2} \text{Tr} \left( e^{-\frac{\theta_N}{N} \lambda_{N^2-1}} J_{rN} e^{\frac{\theta_N}{N} \lambda_{N^2-1}} \right) \lambda_{j^2+1} \right]^2 \right\} - \sin^4 \phi_N \left[ d\theta_N + X_N \right]^2. \quad (5.17)
\end{align*}
\]

This is an encouraging form, which upon comparison with (C.3) suggests the identification \( \xi = \phi_N \).

With this identification in mind, let’s first remark that the following recursion relation holds

\[ X_N = \cos^2 \phi_{N-1} (d\theta_{N-1} + X_{N-1}) \quad (5.18) \]

which can be shown by inserting (4.10) in (5.16) and then applying (A.6) and (A.11). A direct computation yields

\[ X_3 = \cos^2 \phi_2 (d\theta_2 + \cos(2\phi_1)d\theta_1), \quad (5.19) \]

from which, through repeated application of the recurrence relation (5.18), we obtain

\[ X_N = \sum_{k=1}^{N-3} \prod_{i=1}^{k} \cos^2 \phi_{N-i} \left[ d\theta_{N-k} + \prod_{i=1}^{N-2} \cos^2 \phi_{N-i} \right] (d\theta_2 + \cos(2\phi_1)d\theta_1). \quad (5.20) \]

At this point we have to compare \( d\theta_N + X_N \) with the coefficient of \( \sin^4 \xi \) in (C.3). In fact, to bring \( d\theta_N + X_N \) to the desired form \( \sum_{i=1}^{N} (\hat{R}_i)^2 d\psi_i \), one is tempted to just set \( \theta_i = \psi_i \) and \( \phi_\mu = \omega_\mu \). However, this cannot be the case because the \( \hat{R}_i \) don’t satisfy the condition \( \sum (\hat{R}_i)^2 = 1 \).

These observations, together with explicit calculations for the case \( N = 4 \) and \( N = 5 \), suggest that we should simply take some linear combination \( \psi_i = \psi_i(\theta_j) \). This can be done as follows: Let us introduce new variables \( \theta_K \), \( k = 1, \ldots, N \), such that

\[
\begin{align*}
    \hat{\theta}_N &= \theta_N, \quad \theta_{N-k} = \theta_{N-k} - \hat{\theta}_{N-k+1}, \quad k = 1, \ldots, N-3, \\
    \theta_1 + \theta_2 &= \theta_1 - \theta_3, \quad \theta_1 - \theta_2 &= \theta_3 - \theta_2. \quad (5.21)
\end{align*}
\]

In this way \( d\theta_N + X_N \) takes the desired form

\[ d\theta_N + X_N = \sum_{i=1}^{N} (\hat{R}_i(\omega_\mu))^2 d\psi_i \quad (5.22) \]

with \( \omega_\mu = \phi_\mu, \mu = 1, \ldots, N - 1, \psi_i = \hat{\theta}_{N-i+1}, \quad i = 1, \ldots, N \) and

\[
\begin{align*}
    R_1 &= \sin \phi_{N-1}, \quad R_k = \sin \phi_{N-k} \prod_{i=1}^{k-1} \cos \phi_{N-i}, \quad k = 2, \ldots, N-1,
\end{align*}
\]
\[ R_N = \prod_{i=1}^{N-1} \cos \phi_{N-i}. \]  

(5.23)

These formulas agree with the expressions in App. C. As the last step, in App D we finally show that, after performing the change of variables described above, the coefficients of $\sin^2 \xi$ and $\sin^2 \phi_N$ also agree. This proves that the metric induced on the base $\mathbb{CP}^N$ of the $U(N)$ fibration by the invariant metric on $SU(N+1)$ is nothing else but the natural Fubini-Study metric in trigonometric coordinates.

We can now use this result as a different method to fix the range of the parameters. In fact, $(R^1, \ldots, R^N)$ parametrize the positive orthant of a sphere, if $0 < \phi_i < \frac{\pi}{2}$, $i = 1, \ldots, N - 1$. Moreover, the identification of $\phi_N$ with $\xi$ yields $\phi \in [0, \pi/2]$. Finally, it is easy to show that the conditions $\theta_i \in [0, 2\pi]$ are equivalent to $\theta_1 \in [0, \pi]$ and $\theta_i \in [0, 2\pi]$, $i = 2, \ldots, N$.

These are the same results obtained in (4.15).

6 Conclusions

In this paper, we have reconsidered the problem of constructing a generalized Euler parametrization for $SU(N)$. The parametrization we find differs slightly from the one described by Tilma and Sudarshan. In fact, comparing our results with the expression (18) in ([1]), it is possible to see that we have chosen $\lambda_{(k-1)^2-1}$ instead of $\lambda_3$. Furthermore, we have computed the corresponding invariant measure, which turns out to coincide with the result in ([1]), despite the slight differences in the choice of the parametrization.

To determine the range of the parameters, we have used two distinct methods, both yielding the same result. To better motivate the name "Euler angles", we have carefully shown that the parametrization captures the Hopf fibration structure of the $SU(N)$ groups. In particular the change of coordinate we found to evidentiate the fibrations, gives an explicit map between the Euler coordinates introduced starting from the generalized Gell-Mann matrices, and the ones introduced in [6] using geometrical considerations.

We have given a quite explicit proof of every assertion. Apart from corroborating the results of Tilma and Sudarshan, we think that our work is providing a complete toolbox of computation techniques useful in applied theoretical physics as well as for experimental physicists.

Acknowledgments

SB and SC would like to thank G. Berrino, Prof. R. Ferrari and Dr. L. Molinari for helpful conversations. BLC is supported by the INFN under grant 8930/01. The work of SC is supported by INFN, COFIN prot. 2003023852008 and the European Commission RTN program MRTN-CT-2004-005104, in which SC is associated to the University of Milano–Bicocca.
A Some commutators

Using the explicit form of the generalized Gell-Mann matrices constructed with the conventions of section 2, we find the useful commutators

\[
\begin{align*}
\{\lambda_{N^2+1}, \lambda_{N^2+2j}\} &= -i\lambda_{j^2} \\
\{\lambda_{N^2+1}, \lambda_{N^2+2j+1}\} &= i\lambda_{j^2+1},
\end{align*}
\]

when \(j = 1, \ldots, N - 1\).

Others interesting relations easy to check are

\[
\begin{align*}
\{\lambda_{N^2+1}, \lambda_{N^2}\} &= -i(N+1)\epsilon_{N+1}\lambda_{(N+1)^2-1} - i \sum_{a=2}^{N} \epsilon_{a}\lambda_{a^2-1}, \\
\{\lambda_{N^2+1}, \lambda_{a^2-1}\} &= i\epsilon_{a}\lambda_{N^2}, \\
\{\lambda_{N^2+1}, \lambda_{(N-1)^2-1}\} &= i(N+1)\epsilon_{N+1}\lambda_{N^2},
\end{align*}
\]

where \(a = 1, \ldots, N\), from which remembering that \(\epsilon_{k} = \sqrt{\frac{2}{k(k-1)}}\), one also finds

\[
\{\lambda_{N^2+1}, [\lambda_{N^2+1}, \lambda_{N^2}]\} = 4\lambda_{N^2}.
\]

From the first two commutators we find the very useful relations

\[
\begin{align*}
e^{ix\lambda_{N^2+1}\lambda_{j^2+1}}e^{-ix\lambda_{N^2+1}} &= \frac{1}{\sin x}\lambda_{N^2+2j+1} - \frac{1}{\tan x}e^{ix\lambda_{N^2+1}\lambda_{N^2+2j+1}}e^{-ix\lambda_{N^2+1}}, \\
e^{ix\lambda_{N^2+1}\lambda_{j^2}}e^{-ix\lambda_{N^2+1}} &= -\frac{1}{\sin x}\lambda_{N^2+2j} + \frac{1}{\tan x}e^{ix\lambda_{N^2+1}\lambda_{N^2+2j}}e^{-ix\lambda_{N^2+1}},
\end{align*}
\]

when \(j = 1, \ldots, N - 1\).

Other useful relations easy to prove using the previous relations are

\[
\begin{align*}
\sum_{a=2}^{N} \epsilon_{a}^2 + (N+1)^2\epsilon_{N+1}^2 &= 4, \\
\sum_{a=2}^{N} \epsilon_{a}^2 + (N+1)\epsilon_{N+1}^2 &= 2, \\
Tr [e^{-ix\lambda_{N^2+1}\lambda_{N^2-1}}e^{ix\lambda_{N^2+1}\lambda_{N^2+1}}] &= \epsilon_{N}\delta_{10}\sin(2x), \\
\frac{1}{2}Tr [\lambda_{a}e^{ix\lambda_{N^2+1}\lambda_{N^2+2i}}e^{-ix\lambda_{N^2+1}}] &= \delta_{a,i^2}\sin x, a \leq N^2 - 1, i = 1, \ldots, N - 1. \\
\frac{1}{2}Tr [\lambda_{a}e^{ix\lambda_{N^2+1}\lambda_{N^2+2i-1}}e^{-ix\lambda_{N^2+1}}] &= -\delta_{a,i^2+1}\sin x, a \leq N^2 - 1, i = 1, \ldots, N - 1, \\
\frac{1}{2}Tr \left[ e^{ix\lambda_{N^2+1}\lambda_{N^2}e^{-ix\lambda_{N^2+1}}} \sum_{a=1}^{N^2-1} C_{a}\lambda_{a} \right] &= \sin(2x)\frac{1}{2} \sum_{b=2}^{N} Tr \left[ C_{b^2-1}\epsilon_{b^2-1} \right].
\end{align*}
\]
\[
\sum_{a=2}^{N} \text{Tr} \left[ A e^{i x \lambda(N-1)^2+1} \lambda a^2-1 e^{-i x \lambda(N-1)^2+1} \right] = \cos^2 x \sum_{a=2}^{N} \text{Tr} \left[ A e^{-i a \lambda a^2-1} \right] ,
\]
(A.11)
\[
e^{i x \lambda N^2-1} \lambda(N-1)^2 e^{-i x \lambda N^2-1} = \cos(N \epsilon_N x) \lambda(N-1)^2 - \sin(N \epsilon_N x) \lambda(N-1)^2+1 ,
\]
(A.12)
\[
e^{i x \lambda N^2-1} \lambda(N-1)^2+1 e^{-i x \lambda N^2-1} = \cos(N \epsilon_N x) \lambda(N-1)^2+1 + \sin(N \epsilon_N x) \lambda(N-1)^2 ,
\]
(A.13)

where we used \( A := \sum_{i=1}^{(N-1)^2-1} A^i \lambda_i \).

### B The total volume of \( SU(k) \)

The total volume for the groups \( SU(k) \) can be found following as shown by Macdonald in [3]. First remember that, in the sense of rational cohomology, \( SU(k) \) is equivalent to the product of odd dimensional spheres

\[
SU(k+1) \sim \prod_{j=1}^{k} S^{2j+1} .
\]
(B.1)

where we chosen \( k+1 \) to obtain recursive relations. The total volume of the group is then uniquely determined when the a metric is established on the Lie algebra. We chosen the metric induced by the scalar product \( \langle A | B \rangle = \frac{1}{2} \text{Tr}(AB) \), for \( A, B \in \mathfrak{su}(k+1) \). In this way the Gell-Mann generators are orthonormal. The formula for the total volume is [3]

\[
\text{Vol}(SU(k+1)) = \prod_{j=1}^{k} \text{Vol}(S^{2j+1}) \cdot \text{Vol}(\mathbb{T}_k) \prod_{\alpha>0} |\alpha^\vee|^2 ,
\]
(B.2)

where \( \alpha^\vee \) are the coroots associated to positive roots and \( \text{Vol}(\mathbb{T}_k) \) is the volume of the torus generated by the simple coroots.

For \( \mathfrak{su}(k+1) \) the simple coroots are \( s_i = L_i - L_{i+1} \), \( i = 1, \ldots, k \) where \( L_i \) is the diagonal matrix with the only non vanishing entry \( \{L_i\}_{ii} = 1 \). After writing \( s_i \) in terms of \( \lambda_j \), as

\[
s_i = \sum_{a=1}^{k} \frac{1}{2} \text{Tr}\{s_i \lambda_{(a+1)^2-1}\} \lambda_{(a+1)^2-1} ,
\]
(B.3)

it is easy to prove the recursive relation

\[
\text{Vol}(\mathbb{T}_k) = \sqrt{\frac{k+1}{2k}} \text{Vol}(\mathbb{T}_{k-1}) .
\]
(B.4)

From this we find

\[
\text{Vol}(SU(k+1)) = \text{Vol}(SU(k)) \frac{\pi^{k+1}}{k!} \sqrt{\frac{k+1}{2k}}
\]
(B.5)

where we used the fact that all the positive coroots have unitary length. If we note that the phase \( e^{i \frac{\pi}{2k} \lambda(k+1)^2-1} \) generates an \( U(1) \) group of volume \( 2\pi \sqrt{\frac{k(k+1)}{2}} \) and that \( U(k) = \frac{SU(k) \times U(1)}{Z_k} \), we can finally write

\[
\text{Vol}(SU(k+1)) = \text{Vol}(U(k)) \frac{\pi^k}{k!} .
\]
(B.6)
The Fubini-Study metric for $\mathbb{CP}^N$

$\mathbb{CP}^N$ is a Kähler manifold of complex dimension $N$. In a local chart, which uses holomorphic inhomogeneous coordinates $\{z^i\}_{i=1}^N \in \mathbb{C}$, the Kähler potential is $K(z^i, \bar{z}^j) = \frac{k}{2} \log(1 + \sum_{i=1}^N |z^i|^2)$ with $k$ a constant. The associated Kähler metric $g_{i\bar{j}} = \frac{\partial^2 K}{\partial z^i \partial \bar{z}^j}$ is then

$$ds_{\mathbb{CP}^N}^2 = k \left( \sum_{i=1}^N dz^i d\bar{z}^i - \frac{\sum_{i,j=1}^N z^i \bar{z}^j \bar{z}^j dz^i}{1 + \sum_{i=1}^N |z^i|^2} \right). \tag{C.1}$$

Notice that obviously it is not possible to cover the whole space with a single chart, but the set of points which cannot be covered has vanishing measure. For our purpose it is therefore enough to consider a single chart.

Let us now search for a trigonometric coordinatization. To this aim let us introduce the new real coordinates $\xi, \omega^\mu, \psi^i, \mu = 1, \ldots, N-1, i = 1, \ldots, N$, such that

$$z^i = \tan \xi R^i(\omega^\mu)e^{i\psi^i}. \tag{C.2}$$

Here $R^i(\omega^\mu)$ is a parametrization of the unit sphere $S^{n-1}$, constructed as an immersion in $\mathbb{R}^N$, where $\sum_{i=1}^N (R^i)^2 = 1$ and $\omega^\mu$ are the angles of the sphere. However, notice that we are restricted to the positive orthant only: $R_i > 0$. If $\omega^\mu$ are the standard angles (starting for example with the azimuthal one $\omega_1$), then $\omega^\mu \in [0, \pi/2]$, $\xi \in [0, \pi/2]$ and $\psi^i \in [0, 2\pi]$. This choice of coordinates finally gives

$$ds_{\mathbb{CP}^N}^2 = d\xi^2 + \sin^2 \xi \left[ \sum_{i=1}^N dR^i dR^i + \sum_{i=1}^N (R^i)^2 d^2 \psi^i \right] - \sin^4 \xi \left[ \sum_{i=1}^N (R^i)^2 d\psi^i \right]^2. \tag{C.3}$$

In particular notice that the coefficient of $\sin^2 \xi$ yields a metric for (the positive orthant of) the sphere $S^{N-1}$.

Final checks

Here we verify that the change of variables introduced in section 5 transforms the terms

$$[d\theta^N + X^i]^2 + \sum_{j=1}^{N-1} \left[ \frac{1}{2} \text{Tr} \left( e^{-i \frac{\theta^N}{\sqrt{N}} \lambda^{2-1}_j J_{h^N} e^{i \frac{\theta^N}{\sqrt{N}} \lambda^{2-1}_j} \lambda^j \right) \lambda^j \right]^2$$

$$+ \sum_{j=1}^{N-1} \left[ \frac{1}{2} \text{Tr} \left( e^{-i \frac{\theta^N}{\sqrt{N}} \lambda^{2-1}_j J_{h^N} e^{i \frac{\theta^N}{\sqrt{N}} \lambda^{2-1}_j} \lambda^{j+1} \right) \lambda^{j+1} \right]^2, \tag{D.4}$$

into the coefficient of $\sin^2 \xi$ in (C.3).

First, using (4.10) and the relations in appendix A, it is possible to show that

$$\text{Tr} \left\{ e^{-i \frac{\theta^N}{\sqrt{N}} \lambda^{2-1}_j J_{h^N} e^{i \frac{\theta^N}{\sqrt{N}} \lambda^{2-1}_j} \lambda^j \right\}$$
Note that these are true for \( N \geq 3 \), if we define \( X_2 := \cos(2\phi_1) d\theta_1 \). From these relations we find

\[
T \left\{ e^{-\frac{\theta_n}{N} \lambda_{N-1}^2} J_{h_N} e^{\frac{\theta_n}{N} \lambda_{N-1}^2} \lambda_j^2 \right\} = \prod_{k=j+1}^{N-1} \cos \phi_k \left[ \sin(2\phi_j) \cos \left( [(j+1)\theta_{j+1}] (d\theta_j + X_j) \right) - 2 \sin \left( [(j+1)\theta_{j+1}] d\phi_j \right) \right],
\]

\[
T \left\{ e^{-\frac{\theta_n}{N} \lambda_{N-1}^2} J_{h_N} e^{\frac{\theta_n}{N} \lambda_{N-1}^2} \lambda_j^2 + 1 \right\} = \prod_{k=j+1}^{N-1} \cos \phi_k \left[ \sin(2\phi_j) \sin \left( [(j+1)\theta_{j+1}] (d\theta_j + X_j) \right) + 2 \cos \left( [(j+1)\theta_{j+1}] d\phi_j \right) \right],
\]

with \( j = 2, \ldots, N-1 \). For \( j = 1 \)

\[
T \left\{ e^{-\frac{\theta_n}{N} \lambda_{N-1}^2} J_{h_N} e^{\frac{\theta_n}{N} \lambda_{N-1}^2} \lambda_1 \right\} = \prod_{k=2}^{N-1} \cos \phi_k \left[ \sin(2\phi_1) \cos(2\theta_2) d\theta_1 - \sin(2\theta_2) d\phi_1 \right],
\]

\[
T \left\{ e^{-\frac{\theta_n}{N} \lambda_{N-1}^2} J_{h_N} e^{\frac{\theta_n}{N} \lambda_{N-1}^2} \lambda_2 \right\} = \prod_{k=2}^{N-1} \cos \phi_k \left[ \sin(2\phi_1) \sin(2\theta_2) d\theta_1 + \cos(2\theta_2) d\phi_1 \right].
\]

Thus we see that (D.4) takes the form \( S_N + U_N \), where

\[
S_N = d\phi_{N-1}^2 + \sum_{j=1}^{N-2} \left\{ \prod_{k=j+1}^{N-1} \cos^2 \phi_k \right\} d\phi_j^2,
\]

\[
U_N = (d\theta_N + X_N)^2 + \sum_{j=2}^{N-1} \sin^2 \phi_j \left\{ \prod_{k=j}^{N-1} \cos^2 \phi_k \right\} (d\theta_j + X_j)^2.
\]
First, we show that
\[ S_N = \sum_{j=1}^{N} dR_j^2, \]  
with \( R^j \) as in (5.23). To this aim let us define the \( N \)-dimensional vector \( \vec{R}_N = (R^1, \ldots, R^N) \). Such a vector has unit length, and satisfies the recurrence relation \( \vec{R}_N = (\sin \phi_{N-1} \cos \phi_{N-1} \vec{R}_{N-1}) \), from which we find
\[ d\vec{R}_N \cdot d\vec{R}_N = d\phi_{N-1}^2 + \cos^2 \phi_{N-1} d\vec{R}_{N-1} \cdot d\vec{R}_{N-1}. \]  
Here the dot indicates the scalar product in \( N \) dimensions. Now, from (D.6), we also have
\[ S_N = d\phi_{N-1}^2 + \cos^2 \phi_{N-1} S_{N-1}. \]  
As \( S_N \) and \( d\vec{R}_N \cdot d\vec{R}_N \) both satisfy the same recurrence relation, the thesis follows because of \( S_2 = d\vec{R}_2 \cdot d\vec{R}_2 \).

The second and last step of our proof consists in showing that after the change of coordinates (5.21) the equation (D.7) takes the form
\[ U_N = \sum_{i=1}^{N} (R^i)^2 d\psi_i^2. \]  
The structure of (D.7) suggests that it is convenient to make the change of variables starting from \( \theta_N \) and \( \theta_{N-1} \) step by step. Note that \( X_{N-1} \) is invariant under this transformation, so that we have
\[ (d\theta_N + X_N)^2 + \sin^2 \phi_{N-1} \cos^2 \phi_{N-1} (d\theta_{N-1} + X_{N-1})^2 = \sin^2 \phi_{N-1} d\tilde{\theta}_N^2 + \cos^2 \phi_{N-1} (d\tilde{\theta}_{N-1} + X_{N-1})^2. \]  
Here we have used (5.18) to express \( X_N \) in terms of \( X_{N-1} \). Then \( U_N \) takes the form
\[ U_N = \sin^2 \phi_{N-1} d\tilde{\theta}_N^2 + \cos^2 \phi_{N-1} \left[ (d\tilde{\theta}_{N-1} + X_{N-1})^2 + \sin^2 \phi_{N-2} \cos^2 \phi_{N-2} (d\tilde{\theta}_{N-2} + X_{N-2})^2 \right] + \ldots. \]  
Now it is possible to use (D.12) with \( N-1 \) in place of \( N \) in order to write \( \theta_{N-2} \) in terms of \( \tilde{\theta}_{N-2} \). In fact, this relation can be applied recursively up to \( d\theta_3 \), obtaining
\[ U_N = \sin^2 \phi_{N-1} d\tilde{\theta}_N^2 + \sum_{j=2}^{N-4} \sin^2 \phi_{N-j} \left[ \prod_{l=N-j+1}^{N-1} \cos^2 \phi_l \right] \left[ (d\tilde{\theta}_j + X_j)^2 + \sin^2 \phi_j \prod_{k=j+1}^{N-1} \cos^2 \phi_k \right] \left[ (d\tilde{\theta}_2 + \cos(2\phi_1) d\theta_1)^2 \right]. \]
\[
\frac{1}{N!} \left[ \prod_{k=2}^{N-1} \cos^2 \phi_k \right] \sin^2 (2 \phi_1) \theta_1^2 .
\]  
(D.14)

At this point we can perform the last two changes of coordinates in (5.21), to show that

\[
d \tilde{\theta}_3 + \tilde{X}_3 = \sin^2 \phi_2 d \tilde{\theta}_3 + \cos^2 \phi_2 (\sin^2 \phi_1 d \tilde{\theta}_2 + \cos^2 \phi_1 d \tilde{\theta}_1) ,
\]  
(D.15)

and this completes the proof.
