Abstract

In this paper we study the three-point correlation functions of two scalar operators with large conformal dimensions and the $R$-current or stress-energy tensor at strong coupling with the help of the AdS$_4$/CFT$_3$ correspondence. The scalar operators are dual to semiclassical strings in $AdS_4 \times CP^3$, which are point-like in AdS. We establish thorough concordance between string theory results at large coupling constant and general predictions coming from Ward identities in the dual three-dimensional superconformal gauge theory.

1 Introduction

One of the active areas of research in theoretical high-energy physics in recent years has been the correspondence between gauge and string theories. Following the impressive conjecture made by Maldacena [1] that type IIB string theory on $AdS_5 \times S^5$ is dual to $\mathcal{N} = 4$ super-Yang–Mills theory with a large number of colors, an explicit realization of the AdS/CFT correspondence was provided in [2]. After that many convincing results have been achieved, paving the way for the subject to become an indispensable tool in probing such diverse areas as the dynamics of quark-gluon plasma and high-temperature superconductivity.

A key feature of the duality is the connection between planar correlation functions of conformal primary operators in the gauge theory and correlators of corresponding vertex operators of closed strings with $S^2$ worldsheet topology. Recently, some progress was accomplished in the study of three- and four-point correlation functions with two and three vertex operators with large quantum numbers at strong coupling. The remaining

*E-mail address: dlarnaudov@phys.uni-sofia.bg
operators were chosen to be various supergravity states with quantum numbers and dimensions of order one. It was shown that the large $\sqrt{\lambda}$ behavior of such correlators is fixed by a semiclassical string trajectory governed by the heavy operator insertions, and with sources provided by the vertex operators of the light states.

Initially this approach was utilized in the computation of two-point functions of heavy operators in [3]–[7]. More recently the above procedure was extended to certain three-point correlators in [8]–[10]. A method based on heavy vertex operators was proposed in [11]. Further developments in the calculation of correlators with two string states are presented in [12]. The main goal of these investigations is elucidation of the structure of three-point functions of three semiclassical operators [13].

Inspired by these studies, in the present paper we consider correlation functions of two massive states with large charges and a conserved current ($R$-current or stress-energy tensor) in the bosonic sector of ABJM theory from the point of view of strings in $AdS_4 \times CP^3$. Our approach is mostly based on the previous works of [9]–[14]. We also check the validity of our results by comparison with related field theory Ward identities.

The paper is organized as follows. In the next section we give a detailed derivation of the three-point function of two scalar operators with large charges and the $R$-current. The relevant structure constant complies with a Ward identity calculation. In the third section we present the three-point correlator of two arbitrary string states and the stress-energy tensor. In the conclusion we discuss the results and make some general remarks.

2 Three-point correlator of two string states and $R$-current

The correlation functions with $R$-symmetry current have attracted the interest of researchers of the AdS/CFT correspondence from the very inception of the duality. The correlator of three $R$-current states was calculated at strong coupling via type-IIB supergravity, and the result was in concordance with field theory results [15]–[16]. Correlation functions of $R$-symmetry current and two BPS operators were also studied [15], and once more there was a match between supergravity and field-theoretic findings with the help of particular Ward identities.

The cases considered before dealt only with BPS states, because one could work only in the supergravity approximation. In this section we calculate the three-point correlator of an $R$-current candidate along with two semiclassical operators corresponding to string solutions. Our results at large ’t Hooft coupling are perfectly compatible with a Ward identity in the dual conformal theory, which is yet another successful confirmation of the AdS/CFT correspondence.
2.1 Form of correlator and Ward identity

We adopt the following conventions: capital letters like $X^M$, $M = 0, \ldots, 9$ denote ten-dimensional coordinates, while the lowercase, $x$ for example, describe four-dimensional ones and points in the dual three-dimensional field theory. Unless stated otherwise lengths between points $|x - y|$ are assumed to be for the three-dimensional theory. Greek letters $\mu = 0, \ldots, 3$ will serve as indices of AdS directions, while Latin ones $i = 0, 1, 2$ will denote boundary ones. Moreover, we will work in the Euclidean continuation of AdS$_4$.

The general form of the three-point function of a scalar operator $O_{\Delta}$ with conformal dimension $\Delta$, its conjugate $\bar{O}_{\Delta}$ and a vector $V_i$ is completely fixed by conformal symmetry. It is given in three dimensions by [17]

$$
\langle V_i(x) O_{\Delta}(x_1) \bar{O}_{\Delta}(x_2) \rangle = C_{123}(\lambda) \frac{x_2^{2\Delta-1}|x_1 - x|}{x_1^{2\Delta} - |x_2 - x|} E_i^r(x_1, x_2),
$$  

(2.1)

We are interested in the case of $V_i$ being the $R$-symmetry current $j_i^R$. We also assume that $O_{\Delta}$ has $R$-charge, which leads to the following Ward identity for (2.1)

$$
\delta^3(x_1 - x) \langle \delta O_{\Delta}(x_1) \bar{O}_{\Delta}(x_2) \rangle + \delta^3(x_2 - x) \langle O_{\Delta}(x_1) \delta \bar{O}_{\Delta}(x_2) \rangle = J [\delta^3(x_1 - x) - \delta^3(x_2 - x)] \langle O_{\Delta}(x_1) \bar{O}_{\Delta}(x_2) \rangle,
$$  

(2.2)

where $J$ is the $R$-charge of $O_{\Delta}$ and we assume that two-point functions are unit normalized. We take the derivative of (2.1) and obtain

$$
\partial^i \langle V_i(x) O_{\Delta}(x_1) \bar{O}_{\Delta}(x_2) \rangle = -4\pi C_{123}(\lambda) \frac{1}{x_1^{2\Delta}} (\delta^3(x_1 - x) - \delta^3(x_2 - x)).
$$  

(2.3)

Combining (2.2) and (2.3) one gets

$$
C_{123}(\lambda) = -\frac{J}{4\pi}.
$$  

(2.4)

This equation gives an all-loop expression for the fusion coefficient $C_{123}(\lambda)$. In the following subsection we will show that string theory provides correctly both the space-time behavior of the correlator (2.1) and the expression in (2.4).

2.2 Holographic calculation of $\langle j_R^\mu(x) O_{\Delta}(x_1) \bar{O}_{\Delta}(x_2) \rangle$

The present subsection is devoted to the computation of the three-point function of two heavy scalar operators and the $R$-current via the AdS/CFT correspondence. The scalars are dual to semiclassical strings, which are point-like in AdS and rotate in $CP^3$ in a
general way. First, we need to find the bulk supergravity field that corresponds to the $R$-current. Gaining intuition from 13 one can deduce that the dual field includes the fluctuations of the bulk metric $h_{\mu \alpha}$ with one $AdS_4$ index and a $CP^3$ index; together with various components of RR-potentials, which do not contribute to our results according to 9 because we are working in the leading semiclassical approximation, i.e. at strong coupling. The metric can be expanded in the components of $CP^3$ Killing vectors

$$h_{\mu \alpha} = \sum_i H^I_\mu (x) Y^I_\alpha (\Omega) .$$

We choose the following representation of $CP^3$ in terms of angles $(\xi, \theta_1, \theta_2, \psi, \varphi_1, \varphi_2)$

$$ds^2_{CP^3} = d\xi^2 + \cos^2 \xi \sin^2 \xi (d\psi + \frac{1}{2} \cos \theta_1 d\varphi_1 - \frac{1}{2} \cos \theta_2 d\varphi_2)^2$$
$$+ \frac{1}{4} \cos^2 \xi (d\theta_1^2 + \sin^2 \theta_1 d\varphi_1^2) + \frac{1}{4} \sin^2 \xi (d\theta_2^2 + \sin^2 \theta_2 d\varphi_2^2) .$$

Let us choose for concreteness dynamics only in the plane with $\psi$ as polar angle. Then the relevant Killing vector will be the corresponding $R$-current which acts as the generator of rotations in the plane. The Killing vector and its unique covariant component assume the form

$$Y^{[\psi]} = \frac{\partial}{\partial \psi} , \quad Y^{[\psi]} = \cos^2 \xi \sin^2 \xi .$$

Following 9 the three-point correlation function has the schematic evaluation

$$\frac{\langle j_i^{[\psi]} (x) \mathcal{O}_\Delta (x_1) \bar{\mathcal{O}}_\Delta (x_2) \rangle}{\langle \mathcal{O}_\Delta (x_1) \bar{\mathcal{O}}_\Delta (x_2) \rangle} = \langle H_i^{[\psi]} (x, x_3 = 0) \rangle \frac{1}{Z_{str}} \int DX e^{-S_{str}[X, \Phi]} \big|_{bulk} ,$$

where $\Phi$ labels all the relevant supergravity fields. The field $H^{[\psi]} (x, x_3 = 0)$ has much smaller conformal dimension than that of the string states. Therefore the string can be treated in semiclassical approximation via Polyakov action, while the supergravity fields should conform to the supergravity approximation, i.e. the string action can be expanded in powers of $h_{\mu \alpha}$

$$S_{str} = \frac{\sqrt{\lambda}}{4\pi} \int d^2 \sigma \sqrt{g} g^{\alpha \beta} \partial_\alpha X^M \partial_\beta X^N G_{MN} \text{+ fermions} ,$$

$$\frac{\delta S_{str}}{\delta h_{\mu \alpha} (X)} = \frac{\sqrt{\lambda}}{2\pi} \int d^2 \sigma (\partial_\tau X^\mu \partial_\tau X^a + \partial_\sigma X^\mu \partial_\sigma X^a) .$$

The relation between $\tilde{\lambda}$ and the ’t Hooft coupling $\lambda$ is $\tilde{\lambda}^2 = 32\pi^2 \lambda^2$. After substituting (2.10) in (2.8) and retaining only the linear in $h_{\mu \alpha}$ term we obtain

$$\frac{\langle j_i^{[\psi]} (x) \mathcal{O}_\Delta (x_1) \bar{\mathcal{O}}_\Delta (x_2) \rangle}{\langle \mathcal{O}_\Delta (x_1) \bar{\mathcal{O}}_\Delta (x_2) \rangle} = - \langle H_i (x, x_3 = 0) \rangle \frac{\delta S_{str}[X, \Phi = 0]}{\delta h_{\mu \alpha} (Z)} \big|_{bulk} =$$
$$- \frac{\sqrt{\lambda}}{2\pi} \int d^2 \sigma (\partial_\tau Z^\mu \partial_\tau Z^a + \partial_\sigma Z^\mu \partial_\sigma Z^a) \langle H_i (x, x_3 = 0) \rangle \big|_{bulk} Y^{[\psi]}_a (\Omega) .$$
At this point a few comments are in order. The path integral in (2.8) is evaluated by saddle-point approximation on the classical solution describing a string that goes from the boundary and back. The expression
\[ \langle H_i(x, x_3 = 0) H_\mu(z) \rangle_{\text{bulk}} \] in (2.11) is actually the bulk-to-boundary propagator of two vector supergravity fields [15]

\[ G_{\mu i}(z; x, x_3 = 0) = \frac{2}{\pi^2} \frac{z_3}{z_3^2 + (z - x)^2} \left( \delta_{\mu i} - \frac{2(z - x)_\mu (z - x)_i}{z_3^2 + (z - x)^2} \right). \] (2.12)

In order to calculate the three-point function we need only to choose an appropriate solution to the string equations of motion dual to the massive states in the correlators. We are interested solely in the dynamics in AdS, because only it enters (2.11). Moreover, we have already specified that the string is rotating along the \( \psi \) direction of \( \mathbb{C}P^3 \). In AdS the solution is purely point-like. It has the following form in Euclidean Poincare coordinates [8]

\[ z_0 = \frac{x_{12}}{2} \tanh(\kappa \tau), \quad z_3 = \frac{x_{12}}{2 \cosh(\kappa \tau)}, \] (2.13)

where we have assumed that the insertion points of the heavy operators are symmetric with respect to the origin of the coordinate system. Also, without loss of generality we have constrained the boundary heavy operators to lie on the Euclidean time direction: \( x_{12} \equiv |x_1^0 - x_2^0| \). We would like to point out that our considerations are applicable to generic string solutions with arbitrary charges in \( \mathbb{C}P^3 \).

Substituting all above in (2.11), we get for the three-point correlator

\[ \frac{\langle j^{[\psi]}(x) O_\Delta(x_1) \bar{O}_\Delta(x_2) \rangle}{\langle O_\Delta(x_1) \bar{O}_\Delta(x_2) \rangle} = -\frac{2}{\pi^2} \int_0^{2\pi} d\sigma \cos^2 \xi \sin^2 \xi \partial_\tau \psi I \int - \frac{2J}{\pi^2} I, \] (2.14)

\[ I = \int_{-\infty}^{\infty} d\tau \left( \frac{z_3}{z_3^2 + (z - x)^2} \right)^2 \left( \delta_{\mu i} + \frac{2x_0 (z - x)_i}{z_3^2 + (z - x)^2} \right) \frac{\pi}{8} \frac{x_{12} E^\Delta_i(x_1, x_2)}{|x_1 - x| |x_2 - x|}, \] (2.15)

where we have used in the last equation that \( x_1 + x_2 = 0 \). Finally we obtain for the three-point function

\[ \langle j^{[\psi]}(x) O_\Delta(x_1) \bar{O}_\Delta(x_2) \rangle = -\frac{J}{4\pi} \frac{E^\Delta_i(x_1, x_2)}{x_{12}^{\Delta - 1} |x_1 - x| |x_2 - x|}, \] (2.16)

which exactly coincides with (2.1) provided that

\[ C_{123}(\lambda \gg 1) = -\frac{J}{4\pi}, \] (2.17)

i.e. we also have complete agreement with the all-loop prediction (2.4).
3 Three-point correlator with stress-energy tensor

The present section is devoted to evaluation of the three-point function of two semi-classical scalar operators dual to string states and the stress-energy tensor. Correlation functions with the stress-energy tensor have been studied before, especially considering the conformal anomaly [19–22].

3.1 Space-time dependence of correlator and Ward identity

The correlation function of any tensor $V_{ij}$ and two scalars with definite conformal dimension is almost completely fixed by conformal symmetry, excluding the structure constant

$$\langle V_{ij}(x)O(x_1)\bar{O}(x_2)\rangle = \frac{C_{123}(\lambda)}{x_{12}^{2\Delta-1}|x_1-x||x_2-x|}F_{ij}(x, x_1, x_2), \quad (3.1)$$

$$F_{ij}(x, x_1, x_2) = E^x_i(x_1, x_2)E^x_j(x_1, x_2) - \frac{\delta_{ij}}{3} \frac{x_{12}^2}{(x_1-x)^2(2x_2-x)^2}.$$  

When $V_{ij} = T_{ij}$, the following Ward identity concerning the conservation of $T_{ij}$ is satisfied

$$\partial^i \langle T_{ij}(x)O(x_1)\bar{O}(x_2)\rangle = \langle O(x)\bar{O}(x_1)\rangle \partial^j \delta^3(x-x_2) + \langle O(x)\bar{O}(x_2)\rangle \partial^j \delta^3(x-x_1). \quad (3.2)$$

This equation can be integrated by $x$, which gives via Gauss’s theorem

$$C_{123}(\lambda) = -\frac{3}{8\pi} \Delta(\lambda). \quad (3.3)$$

This result is an all-loop prediction which we are striving to reproduce at large coupling constant below.

3.2 Calculation of $\langle T_{ij}(x)O(x_1)\bar{O}(x_2)\rangle$

The present problem is solved analogously to the case in the previous section. The stress-energy tensor $T_{ij}$ is dual to the fluctuations of the metric $h_{\mu\nu} = g_{\mu\nu} - g_{\mu\nu}^{AdS}$ of $AdS_4$. Consequently

$$\langle T_{ij}(x)O(x_1)\bar{O}(x_2)\rangle = \langle \hat{h}_{ij}(x)O(x_1)\bar{O}(x_2)\rangle. \quad (3.4)$$

We will need below the bulk-to-boundary propagator for gravitons, which can be extracted from the solution to the linearised equations of motion in de Donder gauge [23, 22]

$$h_{\mu\nu}(x, x_3) = \frac{8}{\pi^2} \int d^3y K(x, x_3; y) j^{j_i}_\mu(x-y) j^{j_i}_\nu(x-y) \mathcal{E}_{ij,kl} \hat{h}^{kl}(y), \quad (3.5)$$

where

$$K(x, x_3; y) = \frac{x_3^3}{(x_3^2 + (x-y)^2)^3}, \quad j^{j_i}_\mu(x) = \delta^j_\mu - \frac{2x_\mu x_i}{x_3^3 + x^2}, \quad \mathcal{E}_{ij,kl} = \frac{\delta_{ik}\delta_{jl} + \delta_{il}\delta_{jk}}{2} - \frac{\delta_{ij}\delta_{kl}}{3}.$$
In order to calculate the three-point function at strong coupling we will proceed in a similar way as before

\[
\frac{\langle \hat{h}_{ij}(x) O_\Delta(x_1) \bar{O}_\Delta(x_2) \rangle}{\langle O_\Delta(x_1) O_\Delta(x_2) \rangle} = -\frac{\delta S_{str}[X, \Phi = 0]}{\delta h^\nu_\mu(Z)} h^\nu_\mu(Z)_{\text{bulk}} = -\frac{\sqrt{\lambda}}{2\pi} \int d^2 \sigma \left( \partial_z Z^\nu \partial_{\tau} Z^\nu + \partial_{\tau} Z^\nu \partial_z Z^\nu \right) \langle \hat{h}_{ij}(x, x_3 = 0) h^\nu_{ij}(z) \rangle_{\text{bulk}}. \tag{3.6}
\]

The relevant string solution is again (2.13) with arbitrary dynamics in $CP^3$. We obtain

\[
\frac{\langle \hat{h}_{ij}(x) O_\Delta(x_1) \bar{O}_\Delta(x_2) \rangle}{\langle O_\Delta(x_1) O_\Delta(x_2) \rangle} = -\frac{8\sqrt{\lambda}}{\pi^2} \int_{-\infty}^{\infty} d\tau z_3^3 \partial_z Z^\nu \partial_{\tau} Z^\nu j^k_{\mu}(z-x) j^l_{\nu}(z-x) \mathcal{E}_{kl,ij} = -\frac{8\sqrt{\lambda}}{\pi^2} \int_{-\infty}^{\infty} d\tau z_3 z_0 \left( \delta_{ij} - \frac{\delta_{ij}}{3} + \frac{2x_0 [\delta_{ij}(z-x)_j + \delta_{ij}(z-x)_i - \frac{2\delta_{ij}(z-x)_n}{3}]}{z^2 + (z-x)^2} \right) + \frac{4x_0^2 (z-x)_i (z-x)_j - \frac{2\delta_{ij}(z-x)^2}{3}}{z^2 + (z-x)^2}, \tag{3.7}
\]

where in the second line we have done all the necessary contractions using the explicit form of the solution (2.13). After tedious but straightforward calculations we get

\[
\frac{\langle \hat{h}_{ij}(x) O_\Delta(x_1) \bar{O}_\Delta(x_2) \rangle}{\langle O_\Delta(x_1) O_\Delta(x_2) \rangle} = -\frac{3\kappa \sqrt{\lambda}}{8\pi} \frac{x_{12} F_{ij}(x, x_1, x_2)}{|x_1 - x||x_2 - x|}, \tag{3.8}
\]

which looks exactly like (3.1) if

\[
C_{123}(\lambda \gg 1) = -\frac{3\kappa \sqrt{\lambda}}{8\pi} = -\frac{3E}{8\pi}, \tag{3.9}
\]

where $E$ is the string energy. The last equation obviously conforms to the result (3.3) following from a Ward identity, because according to the AdS/CFT dictionary $E = \Delta(\lambda)$.

4 Conclusion

The AdS/CFT correspondence was subject to many significant developments in recent years. One of the active areas of research has been the holographic calculation of three-point functions at strong coupling. The correlation function of three massive string states escapes full comprehension so far [13], but we have uncovered almost all features of correlators containing two heavy and one light states in the semiclassical approximation [9] [10] [11].

The present paper continues this line of investigations by considering string theory on $AdS_4 \times CP^3$ dual to the three-dimensional ABJM theory and computing leading three-point functions at large coupling constant, applying the ideas of [9]. We examine the
method in the case of two scalar operators with large charges and a conserved current (either an $R$-symmetry current or the stress-energy tensor). We reproduce the correct space-time behavior of correlators and verify that the structure constants we have obtained at strong coupling are in perfect agreement with corresponding field theory derivations based on Ward identities. Our study extends the results presented in [14] to the AdS$_4$/CFT$_3$ case.

One of the future directions for exploration may be the connection of our work to recent developments in the calculation of correlators with heavy states based on integrability methods in $\mathcal{N} = 4$ SYM [24] and, which is more relevant, ABJM theory [25].
