1. Introduction

MADM is a technique to discover the ideal option between a family of possibilities and a family of certain opinions. The perception of MADM has extensively been utilized in numerous disciplines. Ambiguity usually happened in genuine life troubles owing to the contribution of some convoluted restrictions, unavailability of evidence/information, and unpredictability of the challenge. To survive with this worry, Zadeh [1] expounded the theory of the fuzzy set (FS), which covers the grade of truth $u_{AMG}(x)$ restricted to $[0, 1]$. When the theory of FS was elaborated, then numerous intellectuals
have exploited it in the natural environment of several areas. For instance, Molodtsov [2] initiated the soft sets, Mahmood [2] elaborated the new bipolar soft sets, Somjanta et al. [3] utilized the fuzzy sets in UP-algebra, Noppharat Dokkhamdang et al. [4] utilized the generalized fuzzy sets in UP-algebra, Tanamo et al. [5] explored the Q-fuzzy sets and utilized in UP-algebra, Kawila et al. [6] explored the bipolar fuzzy UP-algebra, Mahmood and Hayat [7] initiated the characterizations of hemirings by their bipolar-valued fuzzy h-ideals, and Mahmood et al. [8] initiated the lattice ordered soft near ring. However, in certain situations, the principle of FS cannot be working effectively; for instance, when an individual face such sorts of information, which contains the truth and falsity grades, then FS failed. To survive with such circumstances, Yager [17] elaborated the theory of Pythagorean FS (PFS), which covers the grade of truth and falsity grades with the rule \( 0 \leq u_{AMG} (x) + v_{ANG} (x) \leq 1 \). When the theory of PFS was elaborated, then numerous scholars have utilized it in the environment of several areas. For instance, Beg and Rashid [10] initiated the intuitionistic hesitant fuzzy sets, Atanassov [11] explored the interval-valued intuitionistic fuzzy sets, Kumari and Mishra [12] investigated the parametric measures for IFSs, Jana and Pal [13] explored bipolar intuitionistic fuzzy soft sets, Joshi and Kumar [14] developed the fuzzy time series model based on intuitionistic fuzzy sets, Fu et al. [15] proposed the correlation measures by using the interval-valued intuitionistic fuzzy sets, and Meng and He [16] elaborated the geometric interaction aggregation operators by using the intuitionistic fuzzy sets.

Again, in certain situations, the principle of IFS cannot be working effectively; for instance, when an individual faces such sorts of information which contains the truth and falsity grades with the rule \( 0 \leq u_{AMG} (x) + v_{ANG} (x) \leq 1 \), then IFS failed. To survive with such circumstances, Yager [17] elaborated the theory of Pythagorean FS (PFS), which covers the grade of truth and falsity grades with the rule \( 0 \leq u_{AMG} (x) + v_{ANG} (x) \leq 1 \). When the theory of PFS was elaborated, then numerous scholars have utilized it in the environment of several areas. For instance, Garg [18] explored the linguistic PFS, Wei and Wei [19] developed the similarity measures for PFS, Xiao and Ding [20] investigated the diverges measures by using the PFS and their application in decision making, Ullah et al. [21] explored some similarity measures based on a novel complex PFS and their application in pattern recognition, Li and Lu [22] proposed some similarity and distance measures for PFSs, Garg [23] proposed the novel improved accuracy function for interval-valued PFS and their application in decision making, and Yang and Hussain [24] investigated some entropy measures for PFS and their application.

Again, in certain situations, the principle of PFS cannot be working effectively; for instance, when an individual faces such sorts of information which contains the truth and falsity grades with the rule \( 0 \leq u_{AMG} (x) + v_{ANG} (x) \leq 1 \), then PFS failed. To survive with such circumstances, Yager [25] elaborated the theory of q-rung orthopair FS (q-ROFS), which covers the grade of truth and falsity grades with the rule \( 0 \leq u_{AMG} (x) + v_{ANG} (x) \leq 1 \). When the theory of q-ROFS was elaborated, then numerous scholars have utilized it in the environment of several areas; for instance, Ali [26] created another view on q-ROFSs. Liu and Wang [27] elaborated the aggregation operators for q-ROFSs. Peng and Liu [28] investigated the information measures for q-ROFSs. Wang et al. [29] explored the similarity measures for q-ROFSs. Ali and Mahmood [30] investigated the complex q-ROFSs and their Maclaurin symmetric mean operators. Liu et al. [31] proposed cosine similarity and distance measures for q-ROFSs. Liu and Wang [32] investigated the Archimedean Bonferroni mean operators for q-ROFSs. Liu et al. [33] explored the linguistic q-ROFSs. Garg [34] investigated the possibility degree for interval-valued q-ROFSs. The power aggregation operators for complex q-ROFSs were developed by Garg et al. [35].

To handle such sorts of concerns, Zadeh [36] investigated the theory of linguistic variable (LV) to describe the preferences of decision-makers. Moreover, the theory of a 2-tuple linguistic set was developed by Herrera and Martínez [37]. Liu and Jin [38] investigated the uncertain LV (ULV). In approximate actual existence troubles, the sum of truth and falsity grades to which an option filling an ascribe offered by the decision-maker could not hold the rule of IFS, PFS, and q-ROFSs; then, the theory of IFS and PFS fails in such situations. To survive with such circumstances, Riaz and Hashmi [39] elaborated the theory of linear Diophantine FS (LDFS), which covers the grade of truth and falsity grades and their reference parameters with the rule \( 0 \leq \alpha_{AMG} u_{AMG} (q) + \beta_{ANG} v_{ANG} (q) \leq 1 \). When the theory of LDFS was elaborated, then numerous scholars have utilized it in the environment of several areas; for instance, Riaz et al. [40] discovered the theory of linear Diophantine fuzz soft rough sets and their applications. Some algebraic structures based on LDFS were developed by Kamaci [41]. But, up to date, no study explored the theory of LDULVs and their operational laws.

The concepts of intuitionistic fuzzy sets (IFSs), Pythagorean fuzzy sets (PFSSs), q-rung orthopair fuzzy sets (q-ROFSs), and linear Diophantine fuzzy sets have numerous applications in various fields of real life, but these theories have their own limitations related to the membership and nonmembership grades. To eradicate these restrictions, we introduce the novel concept of the linear Diophantine uncertain linguistic set (LDULS) with the addition of reference parameters and uncertain linguistic terms. The proposed model of LDULS is more efficient and flexible rather than other approaches due to the use of reference parameters and ULVs. LDULS also categorizes the data in MADM problems by changing the physical sense of reference parameters and ULVs. This set covers the spaces of existing structures and enlarge the space for membership and nonmembership grades with the help of reference parameters and ULVs. The motivation of the proposed model is given step by step in the whole manuscript. Now, we discuss some important objectives of this study.

1. The theory of LDULS is more generalized than IFSs, PFSSs, q-ROFSs, LDFSs, and ULVs.
2. If we choose the information in the form of \((0.5, 0.6)\), then by using the condition of IFSs, that is, the sum
of both terms is limited to unit interval, but \(0.5 + 0.6 = 1.1 > 1\), the theory of IFS has been failed for coping with such sorts of issues, and the theory of LDULS is very comfortable to resolve the above issues. For this, we choose the reference parameters such as \((0.1, 0.2)\); then, by using the condition of LDULS, \(0.1 + 0.5 + 0.2 + 0.6 = 0.05 + 0.12 = 0.17 < 1\). We clear that the IFS is the special case of the proposed LDULS.

(3) If we choose the information in the form of \((0.8, 0.9)\), then by using the condition of PFSs, that is, the sum of the square of both terms is limited to unit interval, but \(0.8^2 + 0.9^2 = 0.64 + 0.81 = 1.45 > 1\), the theory of PFS has been failed for coping with such sorts of issues, and the theory of LDULS is very comfortable to resolve the above issues. For this, we choose the reference parameters such as \((0.2, 0.2)\); then, by using the condition of LDULS, \(0.2 + 0.8 + 0.2 * 0.9 = 0.16 + 0.18 = 0.34 < 1\). We clear that the theory of PFSs is the special case of the proposed LDULS.

(4) If we choose the information in the form of \((0.1, 0.1)\), then by using the condition of q-ROFSs, that is, the sum of the \(q\)-powers of both terms is limited to unit interval, but \(1 + 1 = 2 > 1\), the theory of q-ROFS has been failed for coping with such sorts of issues, and the theory of LDULS is very comfortable to resolve the above issues. For this, we choose the reference parameters such as \((0.0, 1.0)\); then, by using the condition of LDULS, \(0.0 + 1.0 + 1.0 = 0 + 0.1 = 0.1 < 1\). We clear that the theory of q-ROFSs is the special case of the proposed LDULS.

(5) If we choose the information in the form of \([s_1, s_2], (0.5, 0.3), (0.5, 0.4)\), then using the condition of IFss, PFSs, q-ROFSs, and LDFS has been failed; for coping with such sorts of issues, the theory of LDULS is very proficient and reliable technique to resolve with it. From the above analysis, the theories of IFss, PFSs, q-ROFSs, and LDFSs are the special case of the proposed LDULS.

The opinions of IFSs, PFSs, q-ROFSs, and LDFSs have repeated applications in uncountable fields of genuine existence, but these philosophies have their shortcomings associated with the truth and falsity grades. To eliminate these constraints, we announce the narrative hypothesis of LDULS with the supplement of situation parameters. The suggested version of LDULS is additionally inexpensive and accommodating more accurately than other methodologies expected to the usage of suggestion parameters. LDULS also compartmentalizes the information in MADM troubles by modifying the physical meaning of orientation parameters. This set encompasses the areas of accessible assemblies and expands the space for truth and falsity grades with the help of reference parameters. The inspiration of the suggested pattern is offered step by step in the entire script.

The rest of this manuscript as follows. In Section 2, we briefly recall some definitions such as LDFSs, ULSs, and their operational laws. The theory of power aggregation (PA) operator is also reviewed. In Section 3, we notified the novel idea of LDULS and elaborated their fundamental laws. In Section 4, we elaborated the LDULPEA, LDULPEWA, LDULPEG, and LDULPEWG operators and their properties are also discovered. In Section 5, by using these operators, we acquire a MADM procedure based on elaborated operators. To determine the consistency and validity of the elaborated operators, we illustrate some examples by using explored operators. Finally, the superiority and comparative analysis of the elaborated operators with some existing operators are also determined and justify with the help of a graphical point of view. In Section 6, we discussed the conclusion of this study.

As shown above, the advantages of the operators and keeping the superiority of the elaborated approaches, the main points of the elaborated approaches are discussed as shown in Figure 1.

2. Preliminaries

Certain scholars have proposed numerous theories such as fuzzy sets, intuitionistic fuzzy sets, and their extensions to cope with awkward and complicated information in real-life issues. But these theories have their own limitations related to the membership and nonmembership grades. To eradicate these restrictions, the theory of the linear Diophantine fuzzy set (LDFS) with the addition of reference parameters was explored by Riaz and Hashmi [39]. The proposed model of LDFS is more efficient and flexible rather than other approaches due to the use of reference parameters. LDFS also categorize the data in MADM problems by changing the physical sense of reference parameters. This set covers the spaces of existing structures and enlarge the space for membership and nonmembership grades with the help of reference parameters. Keeping the advantages of the existing LDFS, in this section, we briefly recall some definitions such as LDFSs, ULFs, and their operational laws. The theory of the PA operator is also reviewed. In an overall study, the universal set is denoted by \(X\).

**Definition 1** (see [39]). A LDFS \(A_{LD}\) is elaborated by

\[
A_{LD} = \left\{ \left( x, (\alpha_{AMG}(x), \beta_{ANG}(x)), (\alpha_{AMG}, \beta_{ANG}) \right) \mid x \in X \right\},
\]

with a rule \(0 \leq \alpha_{AMG} u_{AMG}(x) + \beta_{ANG} v_{ANG}(x) \leq 1\), with \(0 \leq \alpha_{AMG} + \beta_{ANG} \leq 1\). The symbol \(\xi_{AMG}(x)_{\alpha_{AMG}} = 1 - (\alpha_{AMG} u_{AMG}(x) + \beta_{ANG} v_{ANG}(x))\) expressed the refusal grade. Simply, \(A_{LD} = \left( (u_{AMG}(x), v_{ANG}(x)), t(\alpha_{AMG}, \beta_{ANG}) \right)\) is called linear Diophantine fuzzy number (LDFN). To determine the interrelationships between any numbers of attributes, we revised some algebraic operation laws which are very important for proposed work in the next study.
**Figure 1: Geometrical expressions of the explored approaches.**

**Definition 2** (see [39]). For any two LDFNs $A_{LD} = ((u_{AMG}(x), t\nu_{ANG}(x)), t(\alpha_{AMG}, \beta_{ANG}))$ and $B_{LD} = ((u_{BMG}(x), t\nu_{BNG}(x)), t(\alpha_{BMG}, \beta_{BNG}))$,

\[
A_{LD} \oplus B_{LD} = \left( (u_{AMG} + u_{BMG} - u_{AMG}u_{BMG}, \nu_{AMG}u_{BMG}), \left( \alpha_{AMG} + \alpha_{BMG} - \alpha_{AMG}^2\alpha_{BMG} + \beta_{ANG}^2\beta_{BNG} \right) \right),
\]

(2)

\[
A_{LD} \otimes B_{LD} = \left( (u_{AMG}u_{BMG}, \nu_{AMG} + v_{BMG} - v_{AMG}v_{BMG}), \left( \alpha_{AMG}^2\alpha_{BMG} + \beta_{ANG}^2\beta_{BNG} - \beta_{ANG}^2\beta_{BNG} \right) \right),
\]

(3)

\[
\lambda A_{LD} = \left( \left( 1 - (1 - u_{AMG}(x))^i, (\nu_{ANG}(x))^i \right), \left( 1 - (1 - \alpha_{AMG})^i, (\beta_{ANG})^i \right) \right),
\]

(4)

\[
A_{LD}^i = \left( (u_{AMG}(x))^i, 1 - (1 - (\nu_{ANG}(x))^i) \right), \left( (\alpha_{AMG})^i, 1 - (1 - \beta_{ANG})^i \right),
\]

(5)

Furthermore, by using any number of LDFNs, we revised the score values for determining the ordering between any two LDFNs.

**Definition 3** (see [39]). For any LDFN $A_{LD} = ((u_{AMG}(x), t\nu_{ANG}(x)), t(\alpha_{AMG}, \beta_{ANG}))$, the score value (SV) is elaborated by

\[
\zeta_{A_{LD}} = \zeta(A_{LD}) = \frac{1}{2} \left( u_{AMG}(x) - \nu_{ANG}(x) + (\alpha + \beta) \right).
\]

(6)

Furthermore, if equation (6) has been failed by comparing any number of LDFNs, then we used the technique of accuracy function, so, for this, we revised the accuracy values for determining the ordering between any two LDFNs.

**Definition 4** (see [39]). For any LDFN $A_{LD} = ((u_{AMG}(x), t\nu_{ANG}(x)), t(\alpha_{AMG}, \beta_{ANG}))$, the accuracy value (AV) is elaborated by

\[
\varphi_{A_{LD}} = \varphi(A_{LD}) = \frac{1}{2} \left( \frac{(u_{AMG}(x) + \nu_{ANG}(x))}{2} + (\alpha + \beta) \right).
\]

(7)

**Definition 5** (see [39]). For any two LDFNs $A_{LD} = ((u_{AMG}(x), t\nu_{ANG}(x)), t(\alpha_{AMG}, \beta_{ANG}))$ and $B_{LD} = ((u_{BMG}(x), t\nu_{BNG}(x)), t(\alpha_{BMG}, \beta_{BNG}))$,

1. If $\zeta_{A_{LD}} < \zeta_{B_{LD}}$, then $A_{LD} < B_{LD}$
2. If $\zeta_{A_{LD}} > \zeta_{B_{LD}}$, then $A_{LD} > B_{LD}$
3. If $\zeta_{A_{LD}} = \zeta_{B_{LD}}$, then $A_{LD} \approx B_{LD}$

When faced with problems that are too complex or ill-defined to be solved by quantitative expressions, linguistic variables can be an effective tool because the use of linguistic information enhances the reliability and flexibility of classical decision models. To handle such sorts of concerns, Zadeh [36] investigated the theory of linguistic variable (LV) to describe the preferences of decision-makers. Moreover, the theory of a 2-tuple linguistic set was developed by Herrera and Martinez [37]. Liu and Jin [38] investigated the uncertain LV (ULV).
where $l$ should be odd and hold the following conditions:

1. If $l > l'$, then $s_l > s_{l'}$.
2. The negative operator $\neg (s_l) = s_{l'}$ with a condition $l + l' = l + 1$.
3. If $l \geq l'$, $\max (s_l, s_{l'}) = s_l$, and if $l \leq l'$, $\max (s_l, s_{l'}) = s_{l'}$.

Let $\bar{s} = [s_a, s_b]$ where $s_a$ and $s_b$ are the lower and the upper limits, respectively. We call $\bar{s}$ the uncertain linguistic variable. To determine the interrelationships between any numbers of attributes, we revised some operation laws for ULVs which are very important for the proposed work in next study.

**Definition 7 (see [38]).** For any two ULVs $\bar{s}_1 = [s_{a1}, s_{b1}]$ and $\bar{s}_2 = [s_{a2}, s_{b2}]$,

\[
\bar{s}_1 \oplus \bar{s}_2 = [s_{a1} + s_{b2}, s_{b1} + s_{a2}], \quad \bar{s}_1 \otimes \bar{s}_2 = [s_{a1} s_{a2}, s_{a2} s_{a1}],
\]

\[
\lambda \bar{s}_1 = [\lambda s_{a1}, s_{b1}], \quad (\bar{s}_1)^{1/\lambda} = [s_{a1}^{1/\lambda}, s_{b1}^{1/\lambda}].
\]

\[\text{Complexity} 5\]

For any two LDULNs $\text{AMG}_A$ and $\text{AMG}_B$,

\[
\text{AMG}_A \oplus \text{AMG}_B = \left\{ x \left[ \left( s_{\theta(X), \theta^{-1}(x)} \right) \left( u_{\text{AMG}}(x), v_{\text{ANG}}(x) \right), \left( a_{\text{AMG}}, b_{\text{ANG}} \right) \right] \right\},
\]

where $0 \leq a_{\text{AMG}} u_{\text{AMG}}(x) + b_{\text{ANG}} v_{\text{ANG}}(x) \leq 1$, with $0 \leq a_{\text{AMG}} + b_{\text{ANG}} \leq 1$.

**Definition 10.** For any two LDULNs $\text{AMG}_A = ([s_{A, \theta(X)}, s_{A, \theta^{-1}(X)}], (u_{\text{AMG}}(x), v_{\text{ANG}}(x)), (a_{\text{AMG}}, b_{\text{ANG}}))$ and $\text{AMG}_B = ([s_{B, \theta(X)}, s_{B, \theta^{-1}(X)}], (u_{\text{BMG}}(x), v_{\text{BNG}}(x)), (a_{\text{BMG}}, b_{\text{BNG}}))$, then

\[
\text{AMG}_A \oplus \text{AMG}_B = \left\{ x \left[ \left( s_{A, \theta(X) + B, \theta(X)} + s_{A, \theta^{-1}(X) + B, \theta^{-1}(X)} \right) \left( u_{\text{AMG}} + u_{\text{BMG}} - u_{\text{AMG}} u_{\text{BMG}} \right), \left( a_{\text{AMG}} + a_{\text{BMG}} - a_{\text{AMG}} a_{\text{BMG}} b_{\text{ANG}} b_{\text{BNG}} \right) \right] \right\},
\]

\[
\lambda \text{AMG}_A = \left\{ x \left[ \left( s_{A, \theta(X)} + s_{A, \theta^{-1}(X)} \right) \left( 1 - (1 - u_{\text{AMG}}(x))^\lambda, (v_{\text{ANG}}(x))^{1/\lambda} \right), \left( 1 - (1 - a_{\text{AMG}})^\lambda, b_{\text{ANG}} \right) \right] \right\},
\]

\[
\text{AMG}_A^\lambda = \left\{ x \left[ \left( s_{A, \theta(X)}^\lambda, s_{A, \theta^{-1}(X)}^\lambda \right) \left( (u_{\text{AMG}}(x))^\lambda, 1 - (1 - (v_{\text{ANG}}(x)))^\lambda \right), \left( (a_{\text{AMG}})^\lambda, 1 - (1 - b_{\text{ANG}})^\lambda \right) \right] \right\}.
\]

**Example 1.** For any two LDULNs $\text{AMG}_A = ([s_1, s_2], (0.5, 0.3), (0.5, 0.4))$ and $\text{AMG}_B = ([s_2, s_3], (0.7, 0.5), (0.1, 0.3))$, with $\lambda = 2$, then by using Definition 10, we get
For any LDULNs $A_{LD} = ([s_{A-\theta(x)}, s_{A-\tau(x)}], (u_{AMG}(x), v_{ANG}(x)), (\alpha_{AMG}, \beta_{ANG}))$ and $B_{LD} = ([s_{B-\theta}(x), s_{B-\tau(x)}], (u_{BMG}(x), v_{BNG}(x)), (\alpha_{BMG}, \beta_{BNG}))$, the expected value (EV) is elaborated as

$$E(A_{LD}) = s((u_{AMG}(x) + v_{ANG}(x)) + (u_{BMG}(x) + v_{BNG}(x))) / 4.$$  

(14)

**Definition 11.** For any LDULN $A_{LD} = ([s_{A-\theta(x)}, s_{A-\tau(x)}], (u_{AMG}(x), v_{ANG}(x)), (\alpha_{AMG}, \beta_{ANG}))$, the expected value (EV) is elaborated by

$$E(A_{LD}) = s((u_{AMG}(x) + v_{ANG}(x))) / 4.$$  

(15)

**Definition 12.** For any LDULN $A_{LD} = ([s_{A-\theta(x)}, s_{A-\tau(x)}], (u_{AMG}(x), v_{ANG}(x)), (\alpha_{AMG}, \beta_{ANG}))$, the accuracy value (AV) is elaborated by

$$c_{A_{LD}} = c(A_{LD}) = s((u_{AMG}(x) + v_{ANG}(x)) + (u_{BMG}(x) + v_{BNG}(x))) / 4.$$  

(16)

### 4. The Power Aggregation (PA) Operator

Here, we review the basic Einstein t-norm and t-conorm, which are useful for the elaborated approaches.

(1) $a \otimes b = (a + b) / (1 + a \cdot b), a, b \in [0, 1]$

(2) $a \oplus b = (a \cdot b) / (1 + (1 - a) \cdot (1 - b)), a, b \in [0, 1]$

By using any two LDULNs $A_{LD} = ([s_{A-\theta(x)}, s_{A-\tau(x)}], (u_{AMG}(x), v_{ANG}(x)), (\alpha_{AMG}, \beta_{ANG}))$ and $B_{LD} = ([s_{B-\theta(x)}, s_{B-\tau(x)}], (u_{BMG}(x), v_{BNG}(x)), (\alpha_{BMG}, \beta_{BNG}))$, we have:

**Example 2.** For any LDULN $A_{LD} = ([s_{A-\theta(x)}, s_{A-\tau(x)}], (0.5, 0.3), (0.5, 0.4))$, the expected value (EV) is elaborated as

$$E(A_{LD}) = s((1 + 2) / (1/2 (0.5 + 0.3 + 0.5 + 0.4))) / 4 = s((3) / (1.05)) / 4 = s_{0.7875}.$$  

(16)
\[ A_{LD}^1 = \left[ s_{A-\theta(x)}, s_{A-\tau(x)} \right], \frac{2(u_{AMG}(x)^4 - (1 - u_{AMG}(x))^4)}{(2 - u_{AMG}(x))^4 + (u_{AMG}(x))^4}, \left( 1 + \frac{v_{ANG}(x)}{1 - v_{ANG}(x)} \right) \right] \] (17)

\[ A_{LD} \otimes B_{LD} = \left[ s_{A-\theta(x)} \otimes s_{B-\theta(x)}, s_{A-\tau(x)} \otimes s_{B-\tau(x)} \right], \left( \frac{u_{AMG}(x) + u_{BNG}(x)}{1 + u_{AMG}(x) \cdot u_{BNG}(x)} \right), \left( \frac{v_{ANG}(x) \cdot v_{BNG}(x)}{1 + (1 - v_{ANG}(x)) \cdot (1 - v_{BNG}(x))} \right) \] (18)

\[ \lambda(A_{LD} \otimes B_{LD}) = \left[ s_{\lambda(A-\theta(x))} \otimes s_{\lambda(A-\tau(x))} \right], \left( \frac{(1 + u_{AMG}(x))(1 + u_{BNG}(x))}{(1 + u_{AMG}(x))(1 + u_{BNG}(x))} \right), \left( \frac{2(v_{ANG}(x) \cdot v_{BNG}(x))^4}{(4 - 2v_{ANG}(x) - 2v_{BNG}(x) + v_{ANG}(x) \cdot v_{BNG}(x))^4} \right), \left( \frac{(1 + a_{AMG})(1 + a_{BNG})}{(1 + a_{AMG})(1 + a_{BNG})} \right), \left( \frac{2(\beta_{ANG} \cdot \beta_{BNG})^4}{(4 - 2\beta_{ANG} - 2\beta_{BNG} + \beta_{ANG} \cdot \beta_{BNG})^4 + (\beta_{ANG} \cdot \beta_{BNG})^4} \right) \] (19)

**Theorem 2.** For any two LDULNs \( A_{LD} = \left[ s_{A-\theta(x)}, s_{A-\tau(x)} \right], (u_{AMG}(x), v_{ANG}(x)), (a_{AMG}, \beta_{ANG}) \) and \( B_{LD} = \left[ s_{B-\theta(x)}, s_{B-\tau(x)} \right], (u_{BMG}(x), v_{BNG}(x)), (a_{BNG}, \beta_{BNG}) \), then

1. \( A_{LD} \otimes B_{LD} = B_{LD} \otimes A_{LD} \)
2. \( A_{LD} \otimes B_{LD} = B_{LD} \otimes A_{LD} \)
3. \( \lambda(A_{LD} \otimes B_{LD}) = \lambda(A_{LD}) \otimes \lambda(B_{LD}), \lambda > 0 \)

**Proof.** The proof of the first two parts is trivial. Additionally, we prove that part 3 is true:

\[ \lambda(A_{LD} \otimes B_{LD}) = \left[ s_{\lambda(A-\theta(x))} \otimes s_{\lambda(A-\tau(x))} \right], \left( \frac{(1 + u_{AMG}(x))(1 + u_{BNG}(x))}{(1 + u_{AMG}(x))(1 + u_{BNG}(x))} \right), \left( \frac{2(v_{ANG}(x) \cdot v_{BNG}(x))^4}{(4 - 2v_{ANG}(x) - 2v_{BNG}(x) + v_{ANG}(x) \cdot v_{BNG}(x))^4} \right), \left( \frac{(1 + a_{AMG})(1 + a_{BNG})}{(1 + a_{AMG})(1 + a_{BNG})} \right), \left( \frac{2(\beta_{ANG} \cdot \beta_{BNG})^4}{(4 - 2\beta_{ANG} - 2\beta_{BNG} + \beta_{ANG} \cdot \beta_{BNG})^4 + (\beta_{ANG} \cdot \beta_{BNG})^4} \right) \] (19)

For the right hand of the part (3),

\[ \lambda A_{LD} = \left[ s_{\lambda(A-\theta(x))} \otimes s_{\lambda(A-\tau(x))} \right], \left( \frac{(1 + u_{AMG}(x))(1 + u_{BNG}(x))}{(1 + u_{AMG}(x))(1 + u_{BNG}(x))} \right), \left( \frac{2(v_{ANG}(x))^4}{(2 - v_{ANG}(x))^4 + (v_{ANG}(x))^4} \right), \left( \frac{(1 + a_{AMG})(1 + a_{BNG})}{(1 + a_{AMG})(1 + a_{BNG})} \right), \left( \frac{2(\beta_{ANG})^4}{(2 - \beta_{ANG})^4 + (\beta_{ANG})^4} \right) \]
\[ \lambda_{LD} = \left[ s_{\lambda-B} \cdot s_{\lambda-B} \right], \left( \frac{(1 + \mu_{BMG}(x)) - (1 - \mu_{BMG}(x))}{(1 + \mu_{BMG}(x)) + (1 - \mu_{BMG}(x))} \right) \left( \frac{2(\nu_{BMG}(x))}{2 - \nu_{BMG}(x)} \right) \]

Similarly, we prove that part 4. Know, for part (5), we have

\[ \text{Hence, we get } \lambda(A_{LD} \otimes B_{LD}) = \lambda A_{LD} \otimes \lambda B_{LD}, \lambda > 0. \]

Similarly, we prove that part 4. Know, for part (5), we have

\[ A_{LD}^1 = \left[ s_{\lambda-B} \cdot s_{\lambda-B} \right], \left( \frac{2(\mu_{BMG}(x))}{(1 + \mu_{BMG}(x)) \cdot (1 - \mu_{BMG}(x))} \right) \left( \frac{2(\nu_{BMG}(x))}{2 - \nu_{BMG}(x)} \right) \]

\[ A_{LD}^2 = \left[ s_{\lambda-B} \cdot s_{\lambda-B} \right], \left( \frac{2(\mu_{BMG}(x))}{(1 + \mu_{BMG}(x)) \cdot (1 - \mu_{BMG}(x))} \right) \left( \frac{2(\nu_{BMG}(x))}{2 - \nu_{BMG}(x)} \right) \]

Then,
\( A_{\text{LD}}^{1} \otimes A_{\text{LD}}^{2} = \left( [S_{A-\theta(x)}\lambda_1 + \lambda_2, S_{A-\tau(x)}\lambda_1 + \lambda_2], \right. \\
\left. \frac{(u_{\text{AMG}}(x))^{1,1}}{(2 - u_{\text{AMG}}(x))^{1,2}(u_{\text{AMG}}(x))^{1,1} + (2 - u_{\text{AMG}}(x))^{2,1}(u_{\text{AMG}}(x))^{2,2}} \cdot \frac{2(1 + v_{\text{ANG}}(x))^{1,1}}{(1 + v_{\text{ANG}}(x))^{1,1} + (1 - v_{\text{ANG}}(x))^{1,1} + (1 + v_{\text{ANG}}(x))^{2,1} + (1 + v_{\text{ANG}}(x))^{2,2}} \right) \\
\left( \frac{(a_{\text{ANG}})^{1,1}}{(2 - a_{\text{AMG}})^{1,1}(a_{\text{AMG}})^{1,1} + (2 - a_{\text{AMG}})^{2,1}(a_{\text{AMG}})^{2,2}} \cdot \frac{2(1 + \beta_{\text{ANG}})^{1,1}}{(1 + \beta_{\text{ANG}})^{1,1} + (1 + \beta_{\text{ANG}})^{2,1} + (1 + \beta_{\text{ANG}})^{2,2}} \right) \right) 
\tag{23} \\
\]

For the right hand of the part (5), we get

\[ A_{\text{LD}}^{1} \otimes A_{\text{LD}}^{2} = \left( [S_{A-\theta(x)}\lambda_1 + \lambda_2, S_{A-\tau(x)}\lambda_1 + \lambda_2], \right. \\
\left. \frac{(u_{\text{AMG}}(x))^{1,1}}{(2 - u_{\text{AMG}}(x))^{1,2}(u_{\text{AMG}}(x))^{1,1} + (2 - u_{\text{AMG}}(x))^{2,1}(u_{\text{AMG}}(x))^{2,2}} \cdot \frac{2(1 + v_{\text{ANG}}(x))^{1,1}}{(1 + v_{\text{ANG}}(x))^{1,1} + (1 - v_{\text{ANG}}(x))^{1,1} + (1 + v_{\text{ANG}}(x))^{2,1} + (1 + v_{\text{ANG}}(x))^{2,2}} \right) \\
\left( \frac{(a_{\text{ANG}})^{1,1}}{(2 - a_{\text{AMG}})^{1,1}(a_{\text{AMG}})^{1,1} + (2 - a_{\text{AMG}})^{2,1}(a_{\text{AMG}})^{2,2}} \cdot \frac{2(1 + \beta_{\text{ANG}})^{1,1}}{(1 + \beta_{\text{ANG}})^{1,1} + (1 + \beta_{\text{ANG}})^{2,1} + (1 + \beta_{\text{ANG}})^{2,2}} \right) \right) \right) 
\tag{24} \\
\]

Hence, we get \( A_{\text{LD}}^{1} \otimes A_{\text{LD}}^{2} = A_{\text{LD}}^{1} \otimes A_{\text{LD}}^{2}, \lambda_1, \lambda_2 > 0. \) Similarly, we prove that part (6). \( \square \)

### 5. Some LDULFPE Operators

In this section, we combine the PA operator and Einstein operations to the LDUL environment, propose the LDULFPEA operator, LDULFPEWA operator, LDULFPEG operator, and LDULFPEGW operator, and discuss the properties of them.

**Definition 14.** For any LDULNs \( A_{\text{LD}}^{i} = ([s_{A-i}, \alpha_{A-i}], (u_{\text{AMG}}-\gamma, v_{\text{ANG}}-\gamma), (\alpha_{\text{AMG}}-\beta, \beta_{\text{ANG}}-\beta)), i = 1, 2, \ldots, n, \) the LDULFPEA operator is elaborated by

\[ \text{LDULFPEA} (A_{\text{LD}}^{1}, A_{\text{LD}}^{2}, \ldots, A_{\text{LD}}^{n}) = \Phi_{\epsilon=1}^{n} \frac{(1 + T(A_{\text{LD}}^{i})) \ast A_{\text{LD}}^{i}}{\sum_{i=1}^{n} (1 + T(A_{\text{LD}}^{i}))} 
\tag{25} \\
\]

where \( T(A_{\text{LD}}^{i}) = \sum_{j=1}^{n} \sup(A_{\text{LD}}^{j}, A_{\text{LD}}^{i}), \) and \( \sup(A_{\text{LD}}^{i}, A_{\text{LD}}^{j}) \) is the support for \( A_{\text{LD}}^{i} \) from \( A_{\text{LD}}^{j}. \)

**Theorem 3.** For any LDULNs \( A_{\text{LD}}^{i} = ([s_{A-i}, \alpha_{A-i}], (u_{\text{AMG}}-\gamma, v_{\text{ANG}}-\gamma), (\alpha_{\text{AMG}}-\beta, \beta_{\text{ANG}}-\beta)), i = 1, 2, \ldots, n, \) then the result aggregated from Definition 14 is still an LDULFN:
\[
\text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-D}) = \left( \left[ \sum_{r_{j, i}} \left( (A\theta_i(1+iT(A_{LD-j}))) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right] \right),
\]

\[
\left( \frac{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) - \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)}{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) + \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)} \right).
\]

\[
\text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-D}) = \left( \left[ \sum_{r_{j, i}} \left( (A\theta_i(1+iT(A_{LD-j}))) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right] \right),
\]

\[
\left( \frac{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) - \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)}{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) + \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)} \right).\]

(26)

where \( T(A_{LD-i}) = \sum_{j=1}^{n} \sup \{A_{LD-i}, A_{LD-j}\} \), and \( \sup \{A_{LD-i}, A_{LD-j}\} \) is the support for \( A_{LD-i} \) from \( A_{LD-j} \).

Proof: To simplify equation (26), we suppose \( c_i = \left( (1+T(A_{LD-i}))/\sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) (i = 1, 2, \ldots, n) \); then, equation (26) can be elaborated as

\[
\left( \frac{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) - \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)}{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) + \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)} \right).
\]

The equation (26) can be proved by mathematical induction on \( n \) as

(1) When \( n = 1 \), equation (26) is right obviously

(2) Suppose when \( n = k \), equation (26) is right, i.e.,

\[
\left( \frac{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) - \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)}{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) + \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)} \right).
\]

Then, when \( n = k + 1 \), we have

\[
\left( \frac{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) - \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)}{\prod_{i=1}^{n} (1 + u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right) + \prod_{i=1}^{n} (1 - u_{AMG-i}) \left( (1+iT(A_{LD-j})) \sum_{i=1}^{n} (1+T(A_{LD-j}))) \right)} \right).
\]
\[ \text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-k+1}) = \text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-k}) \otimes (c_{k+1} A_{LD-i}) \]

\[ = \text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-k}) \otimes \left( [S_{A-t_1, A-t_2}, S_{A-t_3, A-t_4}] \right), \]

\[ \left( \frac{(1 + u_{AMG-k+1})^{c_{k+1}} - (1 - u_{AMG-k+1})^{c_{k+1}}}{(1 + u_{AMG-k+1})^{c_{k+1}} + (1 - u_{AMG-k+1})^{c_{k+1}}} \cdot 2 \left( v_{\text{ANG}-k+1}^{k+1} \right) \right), \]

\[ \left( \frac{(1 + \alpha_{AMG-k+1})^{c_{k+1}} - (1 - \alpha_{AMG-k+1})^{c_{k+1}}}{(1 + \alpha_{AMG-k+1})^{c_{k+1}} + (1 - \alpha_{AMG-k+1})^{c_{k+1}}} \cdot 2 \left( \beta_{\text{ANG}-k+1}^{K+1} \right) \right) \right). \]

(29)

\[ = \text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-k+1}) = \left( [S_{A^{k+1}, A_{LD-k+1}}, S_{A^{k+1}, A_{LD-k+1}}] \right), \]

\[ \left( \frac{\prod_{i=1}^{k+1} (1 + u_{AMG-i})^{c_{i}} - \prod_{i=1}^{k+1} (1 - u_{AMG-i})^{c_{i}}}{\prod_{i=1}^{k+1} (1 + u_{AMG-i})^{c_{i}} + \prod_{i=1}^{k+1} (1 - u_{AMG-i})^{c_{i}}} \cdot 2 \prod_{i=1}^{k+1} (v_{\text{ANG}-i}^{c_{i}}) \right), \]

\[ \left( \frac{\prod_{i=1}^{k+1} (1 + \alpha_{AMG-i})^{c_{i}} - \prod_{i=1}^{k+1} (1 - \alpha_{AMG-i})^{c_{i}}}{\prod_{i=1}^{k+1} (1 + \alpha_{AMG-i})^{c_{i}} + \prod_{i=1}^{k+1} (1 - \alpha_{AMG-i})^{c_{i}}} \cdot 2 \prod_{i=1}^{k+1} (\beta_{\text{ANG}-i}^{c_{i}}) \right). \]

So, when \( n = k + 1 \), equation (26) is also right. According to steps (1) and (2), we can get that equation (26) is right for \( n \).

**Theorem 4.** For any LDULNs \( A_{LD-j} = A_j, j = 1, 2, \ldots, n \) and \( A = ([s_{A-t_1}, s_{A-t_2}], \ (u_{AMG}, v_{\text{ANG}}), \ \alpha_{AMG}, \ \beta_{\text{ANG}}) \).

\[ \text{LDULFPEA}(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) = \left( \left[ \sum_{i=0}^{n} (1+T(A)) \sum_{i=1}^{n} (1+T(A)) \sum_{i=1}^{n} (1+T(A)) \right], \]

\[ \left( \frac{\prod_{i=1}^{n} (1 + u_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A)) - \prod_{i=1}^{n} (1 - u_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A))}{\prod_{i=1}^{n} (1 + u_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A)) + \prod_{i=1}^{n} (1 - u_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A))}, \]

\[ \cdot 2 \prod_{i=1}^{n} (v_{\text{ANG}}^{(1+T(A))}) \sum_{i=1}^{n} (1 + T(A)) + \prod_{i=1}^{n} (v_{\text{ANG}}^{(1+T(A))}) \sum_{i=1}^{n} (1 + T(A)) \right), \]

\[ \left( \frac{\prod_{i=1}^{n} (1 + \alpha_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A)) - \prod_{i=1}^{n} (1 - \alpha_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A))}{\prod_{i=1}^{n} (1 + \alpha_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A)) + \prod_{i=1}^{n} (1 - \alpha_{AMG})^{(1+T(A))} \sum_{i=1}^{n} (1 + T(A))}, \]

\[ \cdot 2 \prod_{i=1}^{n} (\beta_{\text{ANG}}^{(1+T(A))}) \sum_{i=1}^{n} (1 + T(A)) + \prod_{i=1}^{n} (\beta_{\text{ANG}}^{(1+T(A))}) \sum_{i=1}^{n} (1 + T(A)) \right). \]

(30)
For any LDULNs $A_{LDu} = (\{s_A, \theta_s, s_A\}, (u_{AMG}, v_{AMG}, (\alpha_{AMG}, \beta_{AMG})))$, $i = 1, 2, \ldots, n$, if LDULFPEA operator lies between the max and min operators,

$$\begin{align*}
\min(A_{LDu-1}, A_{LDu-2}, \ldots, A_{LDu-n}) &= \min A, \\
\max(A_{LDu-1}, A_{LDu-2}, \ldots, A_{LDu-n}) &= \max A,
\end{align*}$$

(32)

then,

$$\min A \leq LDULFPEA(A_{LDu-1}, A_{LDu-2}, \ldots, A_{LDu-n}) \leq \max A$$

(33)

\[
\begin{align*}
\left(1 - \frac{\max(u_{AMG})}{1 + \max(u_{AMG})}\right) \left(1 + T(A_{LDu})\right) \sum_{i=1}^{n} (1 + T(A_{LDu})) &\leq \left(1 - \frac{\min(u_{AMG})}{1 + \min(u_{AMG})}\right) \left(1 + T(A_{LDu})\right) \sum_{i=1}^{n} (1 + T(A_{LDu})) \\
\prod_{i=1}^{n} \left(1 - \frac{\max(u_{AMG})}{1 + \max(u_{AMG})}\right) \left(1 + T(A_{LDu})\right) \sum_{i=1}^{n} (1 + T(A_{LDu})) &\leq \prod_{i=1}^{n} \left(1 - \frac{\min(u_{AMG})}{1 + \min(u_{AMG})}\right) \left(1 + T(A_{LDu})\right) \sum_{i=1}^{n} (1 + T(A_{LDu})) \\
\left(1 - \frac{\max(u_{AMG})}{1 + \max(u_{AMG})}\right) \sum_{i=1}^{n} (1 + T(A_{LDu})) &\leq \left(1 - \frac{\min(u_{AMG})}{1 + \min(u_{AMG})}\right) \sum_{i=1}^{n} (1 + T(A_{LDu}))
\end{align*}
\]

(34)
i.e.,

\[
1 - \frac{\max(u_{\text{AMG}})}{1 + \max(u_{\text{AMG}})} \leq \prod_{i=1}^{n} \left(1 - \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \leq 1 - \frac{\min(u_{\text{AMG}})}{1 + \min(u_{\text{AMG}})}
\]

\[
\frac{2}{1 + \max(u_{\text{AMG}})} \leq 1 + \prod_{i=1}^{n} \left(1 - \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \leq \frac{2}{1 + \min(u_{\text{AMG}})},
\]

\[
1 + \max(u_{\text{AMG}}) \geq \frac{2}{1 + \prod_{i=1}^{n} \left(1 - \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)}} \geq 1 + \min(u_{\text{AMG}}),
\]

\[
\max(u_{\text{AMG}}) \geq \frac{2}{1 + \prod_{i=1}^{n} \left(1 - \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)}} - 1 \geq \min(u_{\text{AMG}}).
\]

Thus,

\[
\max(u_{\text{AMG}}) \geq \prod_{i=1}^{n} \left(1 + \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} - \prod_{i=1}^{n} \left(1 - \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \geq \min(u_{\text{AMG}}).
\]

Therefore,

\[
\max(u_{\text{AMG}}) \geq \prod_{i=1}^{n} \left(1 + \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} - \prod_{i=1}^{n} \left(1 - \frac{(u_{\text{AMG}-i})}{1 + (u_{\text{AMG}-i})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \geq \min(u_{\text{AMG}}).
\]

Second, let \( f(v_{\text{AMG}-i}) = (2 - v_{\text{AMG}-i})/v_{\text{AMG}-i} \), \( v_{\text{AMG}-i} \in [0,1] \), and we can get \( f(v_{\text{AMG}-i}) = -2(v_{\text{AMG}-i})^2 < 0 \) by taking derivative, so \( f(v_{\text{AMG}-i}) \) is a decreasing function. Suppose \( \min(v_{\text{AMG}}) \leq v_{\text{AMG}-i} \leq \max(v_{\text{AMG}}) \) for all \( i \), we can get \( (2 - \min(v_{\text{AMG}}))/\max(v_{\text{AMG}}) \leq (2 - \min(v_{\text{AMG}}))/\max(v_{\text{AMG}}) \) \( \leq (2 - \min(v_{\text{AMG}}))/\max(v_{\text{AMG}}) \); then, we have

\[
\left(\frac{2 - \min(v_{\text{AMG}})}{\min(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \leq \left(\frac{2 - \max(v_{\text{AMG}})}{\max(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)}
\]

\[
\leq \left(\frac{2 - \max(v_{\text{AMG}})}{\max(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)},
\]

\[
\left(\frac{2 - \min(v_{\text{AMG}})}{\min(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \leq \left(\frac{2 - \max(v_{\text{AMG}})}{\max(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \leq \left(\frac{2 - \max(v_{\text{AMG}})}{\max(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)},
\]

\[
2 - \frac{\min(v_{\text{AMG}})}{\min(v_{\text{AMG}})} \leq \prod_{i=1}^{n} \left(\frac{2 - \min(v_{\text{AMG}})}{\min(v_{\text{AMG}})}\right)^{\left(1 + T(A_{\text{LD}})\right)/\sum_{i=1}^{n} \left(1 + T(A_{\text{LD}})\right)} \leq 2 - \frac{\max(v_{\text{AMG}})}{\max(v_{\text{AMG}})}.
\]
\[
\frac{2}{\min(v_{AMG})} \leq \prod_{i=1}^{n} \left( \frac{2 - (v_{AMG})_i}{(v_{AMG})_i} \right)^{1 + (1 + T(A_{LD,i})) \sum_{i=1}^{n} \left( 1 + T(A_{LD,i}) \right)} + 1 \leq \frac{2}{\max(v_{AMG})},
\]

\[
\frac{2}{\max(v_{AMG})} \geq \prod_{i=1}^{n} \left( \frac{2 - (v_{AMG})_i}{(v_{AMG})_i} \right)^{1 + (1 + T(A_{LD,i})) \sum_{i=1}^{n} \left( 1 + T(A_{LD,i}) \right)} + 1 \geq \frac{2}{\min(v_{AMG})},
\]

(38)

\[
\min(v_{AMG}) \geq \frac{2}{\prod_{i=1}^{n} (2 - (v_{AMG})_i) \sum_{i=1}^{n} \left( 1 + T(A_{LD,i}) \right) + \prod_{i=1}^{n} (v_{AMG})_i \sum_{i=1}^{n} (1 + T(A_{LD,i}))} \geq \max(v_{AMG}).
\]

(39)

For \( \alpha \) and \( \beta \) because \( s_{A - \theta_{\min}} \leq s_{A - \theta} \leq s_{A - \theta_{\max}} \),

\[ s_{A - \tau_{\min}} \leq s_{A - \tau} \leq s_{A - \tau_{\max}} \quad \text{for all } i, \]

then

\[
s(A - \theta_{\min}) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq s(A - \theta) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq s(A - \theta_{\max}) \sum_{i=1}^{n} (1 + T(A_{LD,i}))
\]

\[
s(A - \tau_{\min}) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq s(A - \tau) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq s(A - \tau_{\max}) \sum_{i=1}^{n} (1 + T(A_{LD,i}))
\]

\[
\sum_{i=1}^{n} (A - \theta_{\min}) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq \sum_{i=1}^{n} (A - \theta) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq \sum_{i=1}^{n} (A - \theta_{\max}) \sum_{i=1}^{n} (1 + T(A_{LD,i}))
\]

(40)

i.e.,

\[ s_{A - \theta_{\min}} \leq \sum_{i=1}^{n} (A - \theta) (1 + T(A_{LD,i})) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq s_{A - \theta_{\max}}, \]

\[ s_{A - \tau_{\min}} \leq \sum_{i=1}^{n} (A - \tau) (1 + T(A_{LD,i})) \sum_{i=1}^{n} (1 + T(A_{LD,i})) \leq s_{A - \tau_{\max}}. \]

If \[ LDULFPEA(A_{LD,1}, A_{LD,2}, \ldots, A_{LD,n}) = A = ([s_{A - \theta}, s_{A - \tau}], (\mu_{AMG}, \nu_{ANG}, (\alpha_{AMG}, \beta_{ANG}))), \]

we know that

\[ s_{A - \theta_{\min}} \leq s_{A - \theta} \leq s_{A - \theta_{\max}}, \quad s_{A - \tau_{\min}} \leq s_{A - \tau} \leq s_{A - \tau_{\max}}. \]

\[ \min(\mu_{AMG}) \leq \min(\nu_{ANG}) \leq \nu_{ANG} \leq \max(\mu_{AMG}) - \max(\nu_{ANG}), \]

\[ \min(s_{A - \theta_{\min}}) \leq \min(\beta_{ANG}) \leq \beta_{ANG} \leq \max(s_{A - \theta_{\max}}) - \max(\beta_{ANG}). \]

(41)
Therefore,
\[
\min A \leq \text{LDULFPEA}(A_{1D-1}, A_{1D-2}, \ldots, A_{1D-n}) \leq \max A.
\]  
(42)

\[
\text{LDULFPEA}(A_{1D-1}, A_{1D-2}, \ldots, A_{1D-n}) \leq \text{LDULFPEA}(B_{1D-1}, B_{1D-2}, \ldots, B_{1D-n}).
\]  
(43)

**Proof.** Since \( s_{A-\theta} + s_{A-\tau} \leq s_{B-\theta} + s_{B-\tau} \), \( u_{\text{AMG}} \leq u_{\text{BMG}} \), \( v_{\text{ANG}} \leq v_{\text{BNG}} \), \( \alpha_{\text{AMG}} \leq \alpha_{\text{BMG}} \), and \( \beta_{\text{AMG}} \leq \beta_{\text{BMG}} \) for all \( i \), we can get

\[
\sum_{i=1}^{n} \left( \frac{1 + T(A_{1D-i})}{1 + T(A_{1D-i})} \right) \left( s_{A-\theta} + s_{A-\tau} \right) \leq \sum_{i=1}^{n} \left( \frac{1 + T(A_{1D-i})}{1 + T(A_{1D-i})} \right) \left( s_{B-\theta} + s_{B-\tau} \right).
\]  
(44)

Since \((1 - u_{\text{BMG}})/1 + u_{\text{BMG}} \leq (1 - u_{\text{AMG}})/1 + u_{\text{AMG}}\), \( i = 1, 2, \ldots, n \) then

\[
\prod_{i=1}^{n} \left( \frac{1 - (u_{\text{BMG}})}{1 + (u_{\text{BMG}})} \right) \frac{1 + T(B_{1D-i})}{1 + T(B_{1D-i})} \sum_{i=1}^{n} (1 + T(B_{1D-i})) \leq \prod_{i=1}^{n} \left( \frac{(1 - (u_{\text{AMG}})}{1 + (u_{\text{AMG}})} \right) \sum_{i=1}^{n} (1 + T(A_{1D-i}))
\]  
(45)

So, we have

\[
\prod_{i=1}^{n} \left( \frac{1 + (u_{\text{AMG}})}{1 + (u_{\text{BMG}})} \right) \left( 1 + T(A_{1D-i}) \right) \sum_{i=1}^{n} (1 + T(A_{1D-i})) \leq \prod_{i=1}^{n} \left( \frac{1 + (u_{\text{AMG}})}{1 + (u_{\text{BMG}})} \right) \left( 1 + T(A_{1D-i}) \right) \sum_{i=1}^{n} (1 + T(A_{1D-i}))
\]  
(46)
For $\alpha_{\text{AMG}-i}, \alpha_{\text{BMG}-i}$ we can get

\[
\left(1 - \frac{2 - \nu_{\text{BMG}-i}}{\nu_{\text{BMG}-i}}\right)^{(1+T(A_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(A_{\text{LD}-i})\right) - \sum_{i=1}^{n} \left(1 - \frac{2 - \nu_{\text{AMG}-i}}{\nu_{\text{AMG}-i}}\right)^{(1+T(A_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(A_{\text{LD}-i})\right)
\]

Since $(2 - \nu_{\text{BMG}-i})/\nu_{\text{BMG}-i} \geq (2 - \nu_{\text{AMG}-i})/\nu_{\text{AMG}-i}$, $i = 1, 2, \ldots, n$, then

\[
\left(1 - \frac{2 - \nu_{\text{BMG}-i}}{\nu_{\text{BMG}-i}}\right)^{(1+T(A_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(A_{\text{LD}-i})\right) \geq \left(1 - \frac{2 - \nu_{\text{AMG}-i}}{\nu_{\text{AMG}-i}}\right)^{(1+T(A_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(A_{\text{LD}-i})\right)
\]

\[
\prod_{i=1}^{n} \left(2 - \frac{\nu_{\text{AMG}-i}}{\nu_{\text{BMG}-i}}\right)^{(1+T(B_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(B_{\text{LD}-i})\right) \geq \prod_{i=1}^{n} \left(2 - \frac{\nu_{\text{AMG}-i}}{\nu_{\text{BMG}-i}}\right)^{(1+T(B_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(B_{\text{LD}-i})\right)
\]

\[
\prod_{i=1}^{n} \left(2 - \frac{\nu_{\text{AMG}-i}}{\nu_{\text{BMG}-i}}\right)^{(1+T(B_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(B_{\text{LD}-i})\right) \geq \prod_{i=1}^{n} \left(2 - \frac{\nu_{\text{AMG}-i}}{\nu_{\text{BMG}-i}}\right)^{(1+T(B_{\text{LD}}))} \sum_{i=1}^{n} \left(1 + T(B_{\text{LD}-i})\right)
\]
For $\beta_{\text{ANG}^i \cdot \beta_{\text{BNG}^i}}$ we can get

\[
2 \prod_{i=1}^{n} (\beta_{\text{AMG}^i})^{(1+T(A_{i,D}))} \frac{\sum_{i=1}^{n} (1 + T(A_{i,D}))}{\prod_{i=1}^{n} (2 - (\beta_{\text{AMG}^i}))^{(1+T(A_{i,D}))}} + \prod_{i=1}^{n} (\beta_{\text{AMG}^i})^{(1+T(A_{i,D}))} \frac{\sum_{i=1}^{n} (1 + T(A_{i,D}))}{\prod_{i=1}^{n} (2 - (\beta_{\text{AMG}^i}))^{(1+T(A_{i,D}))}} \leq \frac{2 \prod_{i=1}^{n} (\beta_{\text{BNG}^i})^{(1+T(B_{i,D}))} \frac{\sum_{i=1}^{n} (1 + T(B_{i,D}))}{\prod_{i=1}^{n} (2 - (\beta_{\text{BNG}^i}))^{(1+T(B_{i,D}))}} + \prod_{i=1}^{n} (\beta_{\text{BNG}^i})^{(1+T(B_{i,D}))} \frac{\sum_{i=1}^{n} (1 + T(B_{i,D}))}{\prod_{i=1}^{n} (2 - (\beta_{\text{BNG}^i}))^{(1+T(B_{i,D}))}}.
\]

(50)

Thus, we got that

\[
\text{LDULFPEA}(A_{i,D-1}, A_{i,D-2}, \ldots, A_{i,D-n}) \leq \text{LDULFPEA}(A_{i,D-1}, A_{i,D-2}, \ldots, A_{i,D-n}).
\]

(51)

**Definition 15.** For any LDULNs $A_{i,D-i} = ([s_{A_{i,D-i}}, s_{A_{i,D-i}}], (u_{AMG}^i, v_{ANG}^i), (a_{AMG}^i, \beta_{ANG}^i)), i = 1, 2, \ldots, n$, the LDULFPEWA operator is elaborated by

\[
\text{LDULFPEWA}(A_{i,D-1}, A_{i,D-2}, \ldots, A_{i,D-n}) = \Phi_{i}^{n}(w_i (1 + T(A_{i,D-i})) * A_{i,D-i}) = \Phi_{i}^{n}\left(\frac{w_i (1 + T(A_{i,D-i})) * A_{i,D-i}}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}\right),
\]

where $T(A_{i,D-i}) = \sum_{j=1}^{n} \sup(A_{i,D-j'}, A_{i,D-j})$ is the support for $A_{i,D-i}$ from $A_{i,D-j}$, and $\omega = (w_1, w_2, \ldots, w_n)^T$ is the weighting vector of the $(A_{i,D-1}, A_{i,D-2}, A_{i,D-n})$, such that $w_i \in [0,1], \sum_{i=1}^{n} w_i = 1$.

\[
\text{LDULFPEWA}(A_{i,D-1}, A_{i,D-2}, \ldots, A_{i,D-n}) = \Phi_{i}^{n}\left(\frac{w_i (1 + T(A_{i,D-i})) * A_{i,D-i}}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}\right).
\]

(52)

**Theorem 7.** For any LDULFNs $A_{i,D-i} = ([s_{A_{i,D-i}}, s_{A_{i,D-i}}], (u_{AMG}^i, v_{ANG}^i), (a_{AMG}^i, \beta_{ANG}^i)), i = 1, 2, \ldots, n$, the result aggregated from Definition 15 is still an LDULFN:

\[
\left(\begin{array}{c}
\prod_{i=1}^{n} (1 + u_{AMG}^i) \prod_{i=1}^{n} (1 + T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} - \prod_{i=1}^{n} (1 - u_{AMG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} \\
\prod_{i=1}^{n} (1 + u_{AMG}^i) \prod_{i=1}^{n} (1 + T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} + \prod_{i=1}^{n} (1 - u_{AMG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} \\
\prod_{i=1}^{n} (1 + \alpha_{AMG}^i) \prod_{i=1}^{n} (1 + T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} - \prod_{i=1}^{n} (1 - \alpha_{AMG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} \\
\prod_{i=1}^{n} (1 + \alpha_{AMG}^i) \prod_{i=1}^{n} (1 + T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} + \prod_{i=1}^{n} (1 - \alpha_{AMG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} \\
\prod_{i=1}^{n} (1 - \beta_{ANG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} - \prod_{i=1}^{n} (1 + \beta_{ANG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} \\
\prod_{i=1}^{n} (1 - \beta_{ANG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))} + \prod_{i=1}^{n} (1 + \beta_{ANG}^i) \prod_{i=1}^{n} (1 - T(A_{i,D-i})) \frac{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}{\sum_{i=1}^{n} w_i (1 + T(A_{i,D-i}))}
\end{array}\right).
\]

(53)
where \( T(A_{LD-1}) = \sum_{j=1}^{n} \sup_{\theta \in [A_{LD-1}, A_{LD-j}]} \) sup \((A_{LD-1}, A_{LD-j})\), sup \((A_{LD-1}, A_{LD-j})\) is the support for \( A_{LD-i} \) from \( A_{LD-j} \) and \( w = (w_1, w_2, \ldots, w_n) \) is the weighting vector of the \((A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n})\), such that \( w_i \in [0, 1] \), \( \sum_{i=1}^{n} w_i = 1 \).

Proof. Trivial.

Theorem 8. For any LDULNs \( A_{LD-j} = A, j = 1, 2, \ldots, n \) and \( A = ([s_\alpha, s_{A-\tau}], (u_{AMG}, v_{ANG}), (\alpha_{AMG}, \beta_{ANG})) \), then
\[
LDULFPEWA(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) = A. \tag{54}
\]

Proof. Trivial.

Theorem 9. For any LDULNs \( A_{LD-i} = ([s_\alpha, s_{A-\tau}], (u_{AMG}, v_{ANG}), (\alpha_{AMG}, \beta_{ANG})), i = 1, 2, \ldots, n \), if LDULFPEWA operator lies between the max and min operators,
\[
\begin{align*}
\min(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) &\leq A, \\
\max(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) &\geq A;
\end{align*} \tag{55}
\]

LDULFPEA \((A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) = \left( \left[ \prod_{j=1}^{n} A_{LD-j}^{c_i} \right] \prod_{j=1}^{n} (1 + \frac{\theta_{AMG}^{c_i}}{1 - \theta_{AMG}^{c_i}}) \prod_{j=1}^{n} (1 + \frac{\theta_{ANG}^{c_i}}{1 - \theta_{ANG}^{c_i}}) \right) \prod_{j=1}^{n} (1 - \theta_{ANG}^{c_i}) \prod_{j=1}^{n} \left( 1 - \theta_{AMG}^{c_i} \right), \tag{58}
\]

where \( c_i = (1 + T(A_{LD-i}))/\sum_{j=1}^{n} (1 + T(A_{LD-j}))(i = 1, 2, \ldots, n) \), \( \sup_{A_{LD-j}} = T(A_{LD-i}) = \sum_{j=1}^{n} \sup_{A_{LD-j}}(A_{LD-1}, A_{LD-j}) \) and \( \sup_{A_{LD-j}}(A_{LD-1}, A_{LD-j}) \) is the support for \( A_{LD-i} \) from \( A_{LD-j} \).

Proof. Trivial.

Theorem 11. For any LDULNs \( A_{LD-i} = ([s_\alpha, s_{A-\tau}], (u_{AMG}, v_{ANG}), (\alpha_{AMG}, \beta_{ANG})), \) then
\[
LDULFPEG(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) = A. \tag{59}
\]

Proof. Trivial.

Theorem 12. For any LDULNs \( A_{LD-i} = ([s_\alpha, s_{A-\tau}], (u_{AMG}, v_{ANG}), (\alpha_{AMG}, \beta_{ANG})), i = 1, 2, \ldots, n \), if LDULFPEG operator lies between the max and min operators,
\[
LDULFPEG(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) \leq LDULFPEG(B_{LD-1}, B_{LD-2}, \ldots, B_{LD-n}). \tag{62}
\]

then,
\[
\min A \leq LDULFPEWA(A_{LD-1}, A_{LD-2}, \ldots, A_{LD-n}) \leq \max A. \tag{56}
\]

Proof. Trivial.

Table 3: Score values of the aggregated operators.

| Scores | LDULPEA operator | LDULPEWA operator | LDULPEG operator | LDULPEWG operator |
|--------|------------------|-------------------|-----------------|-------------------|
| $A_1$  | 0.4209           | 0.9842            | 0.6698          | 0.5401            |
| $A_2$  | 0.9216           | 1.0905            | 0.7651          | 0.6298            |
| $A_3$  | 0.7201           | 0.8779            | 0.5746          | 0.4953            |
| $A_4$  | 1.1231           | 1.3032            | 0.9554          | 0.8091            |

Table 4: Ranking values of the information in Table 3.

| Method | Score values        | Ranking values |
|--------|---------------------|----------------|
| LDULPEA operator | Cannot be calculated | $A_4 > A_3 > A_1 > A_2$ |
| LDULPEWG operator | Cannot be calculated | $A_4 > A_3 > A_1 > A_2$ |
| LDULPEA operator | Cannot be calculated | $A_4 > A_3 > A_1 > A_2$ |
| LDULPEG operator | Cannot be calculated | $A_4 > A_3 > A_1 > A_2$ |

Table 5: Comparative analysis of the elaborated operators and existing operators.

| Method | Score values | Ranking values |
|--------|--------------|----------------|
| Riaz and Hashmi [39] | Cannot be calculated | Cannot be calculated |
| Riaz and Hashmi [40] | Cannot be calculated | Cannot be calculated |
| Wang et al. [42] | Cannot be calculated | Cannot be calculated |
| LDULPEA operator | 0.9842, 1.0905, 0.8779, 1.3032 | $A_4 > A_3 > A_1 > A_2$ |
| LDULPEWG operator | 0.5401, 0.6298, 0.4953, 0.8091 | $A_4 > A_3 > A_1 > A_2$ |
| LDULPEA operator | 0.8209, 0.9216, 0.7201, 1.1231 | $A_4 > A_3 > A_1 > A_2$ |
| LDULPEG operator | 0.6698, 0.7651, 0.5746, 0.9554 | $A_4 > A_3 > A_1 > A_2$ |

Illustrated Example. An example of technology commercialization is adapted from [30] where the selection of the most favorable software enterprise among a list of enterprises is carried out. Let us consider four software enterprises denoted by $A_{1,1} \leq G_4$, and the attributes are denoted by $G_1, G_2, G_3$, where $G_1$ represents the advancement of the technology, $G_2$ represents the market potential, $G_3$ represents the human resources and financial development, and $G_4$ represents the creating of employment and development of technology. The weight vector chosen in this case is $\omega = (0.4, 0.3, 0.2, 0.1)^T$. The selection of the weight vector is up to the decision-makers, and the information about the alternatives in terms of LDULNs is given in Table 1.

6.3. Comparative Analysis. Based on the investigated LDULPEA, LDULPEWA, LDULPEG, and LDULPEWG operators, we determined the reliability and consistency of the developed operators with the help of comparative analysis by using the information of Table 1 shown in 6.2. The information related to existing theories is as follows: Riaz and Hashmi [39] elaborated the aggregation operators for LDFS and their applications, Riaz and Hashmi [40] proposed some operators based on linear Diophantine sets, and Wang et al. [42] proposed interaction Hamacher operators for Pythagorean fuzzy sets. The reasonable analysis of the investigated operators and remaining operators are discussed in Table 5 by using the information of Table 1, by using the values of parameters $f = \theta = 1, r = 3$. 

Step 1: in this step, the information given in Table 1 is aggregated using LDULPEA, LDULPEWA, LDULPEG, and LDULPEWG operators. The results of the aggregation are given in Table 2.

Step 2: in this step, the aggregated information obtained in Table 3 is targeted, and their scores are computed using Definition 3.

Step 3: based on the scores obtained in Table 4, the alternatives are ranked, and the ranking results are given in Table 5.

As shown above, we obtained the same ranking results, which are discussed in the form of Table 4. The best option is $A_4$. The results portrayed in Table 3 are further described geometrically in Figure 2.
The results portrayed in Table 5 are further described geometrically in Figure 3.

As shown above, we chose the linear Diophantine uncertain linguistic types of information, so the operators investigated by Riaz and Hashmi [39] are not able to resolve it. However, if we decide the exiting types of information, then the investigated sort of information can cope with it. Therefore, the investigated operators based on LDULSs are more powerful to determine the rationality and consistency of the developed operators.

7. Conclusion

LDULS is a modified variety of the fuzzy set (FS) to manage problematic and inconsistent information in actual life troubles. LDULS covers the grade of truth, grade of falsity, and their reference parameters with ULT with $0 \leq \alpha_{\text{AMG}} u_{\text{AMG}}(x) + \beta_{\text{ANG}} v_{\text{AMG}}(x) \leq 1$, where $0 \leq \alpha_{\text{AMG}} + \beta_{\text{ANG}} \leq 1$. In this manuscript, the principle of LDULS and their useful laws are elaborated. Additionally, PEAO is a conventional sort of AO utilized in innovative decision-making troubles,
which is effective to aggregate the family of numerical elements. To determine the interrelationship between any numbers of arguments, we elaborate on the LDULPEA, LDULPEWA, LDULPEG, and LDULPEWG operators and discussed their useful results. Conclusively, a decision-making methodology is utilized for the MADM dilemma with elaborated information. A sensible illustration is specified to demonstrate the accessibility and rewards of the intended technique by comparison with certain prevailing techniques. The intended AOs are additional comprehensive than the prevailing ones to exploit the ambiguous and inaccurate knowledge. Numerous remaining operators are chosen as individual incidents of the suggested one. Ultimately, the supremacy and advantages of the elaborated operators are also discussed with the help of geometrical form to show the validity and consistency of explored operators.

In further research, considering the superiority of new LDULsSs, we can extend them to some other spherical fuzzy sets [43], spherical linear Diophantine fuzzy sets [44], complex spherical fuzzy sets [45], aggregation operators [42], such as power mean aggregation operators, Bonferroni mean operators, Heronian mean operators, different methods [46–50], and so on [51].
