Abstract

The objective of the present study was to evaluate the effect of active compounds from *Leptadenia reticulate* [W&A] leaf on serum glucose in normal and diabetic rats. Diabetes was induced by Streptozotocin (STZ) and High Fat Diet (HFD) in wistar rats. An isolated fraction of ETLR (100mg/kg) and Metformin (50mg/kg) was administered orally. An isolated fractions showing for higher anti diabetic activity was subjected to column chromatography that led to isolation of a pure compound, which was given trivial name LR-1. The fraction D from ETLR was found to lower the FBG level significantly (*P*<0.05) in diabetic rats. To ensure the compounds responsible for anti-diabetic activities associated with D respectively. Further column chromatographic analysis was carried out with D using various solvent systems and which was given trivial name LR-1. LR-1 was phenolic compound nature (Flavonoids) confirmed by spectral analysis.

Introduction

The chemistry of natural products is an emerging area in drug development activity. The secondary metabolite derived from plant and animal sources are proved to be an effective therapeutic agent in various diseases [1]. Naturally the secondary metabolites of the plant provide defence mechanisms against predators, pathogens, and for self-protection against herbivory and microbes [2]. The scientists are exploiting the natural products of the plant and they are focusing their attention to isolate the secondary metabolites of the plant and animals for treating various ailments [3]. The important plant secondary metabolites are namely alkaloids, glycosides, tannins, lignins, flavanoids, terpenes, volatile oils, fixed oils, steroids so on [4]. The chemistry of natural products helps the scientists to find out the structure of the secondary metabolites by using various separation techniques such as Colum chromatography, thin layer chromatography (TLC) and sophisticated analytical techniques such as UV, IR, NMR and Mass spectroscopy. Currently, at least 119 chemical substances derived from several plant species can be considered as important drugs that are in use in one or more countries [5]. Among these some of the successful drugs are isolated from the natural sources such as antibiotic “penicillin” from *Penicillium notatum*, antimalarial agent “quinine” from *Cinchona succirubra*, narcotic analgesic aspirin precursor “salicin” from white willow bark Salix alba, cardiac glycoside "digoxin" from *digitalis purpurea* and so on [6]. More recently, anticancer agents "vincristine and vinblastine" are isolated from the *Catharanthus roseus*, and these agents are successfully prescribed by the physicians for the treatment of cancer [7]. The interesting results of our preliminary studies with the ethanolic extracts of *Leptadenia reticulata* [W&A] (ETLR) [8] have motivated to isolate anti-diabetic active compounds from the leaves of LR for the management hypoglycaemic and hypolipidemic activities.

Materials and methods

Preparation of different plant extracts

*Leptadenia reticulate* [W&A] leaves were collected from the forest of kalakatu, Tirunelveli District, India. Taxonomic identification was made from botanical survey of medicinal plants, Siddha Unit, Government of India, Palayamkottai authenticated by Chelladurai Botonist. A voucher specimen No (CCRAS-167/2011). Fresh plant leaves were shade dried at room temperature, ground into fine powder and stored in airtight containers. Then extracted (amount 500g) with solvents of increasing polarity such as petroleum ether, ethyl acetate, and ethanol, for 72 hours with each solvent, by continuous hot extraction using the soxhlet apparatus at a temperature of 60°C. The extracts were concentrated under reduced pressure using a rotary evaporator to constant weight. The extracts were collected and preserved in a desiccator until used for further studies.

Fractionation, isolation, purification and characterization of compounds from the ethanol extract

Chromatographic techniques were used for the isolation of compounds from the fractions. The column chromatographic technique most commonly used for the separation of compounds into several fractions according to the affinity or solvating capacity of the compounds to the solvent used. The study involves in fractionation and isolation of compounds from pharmacologically active ethanol extract. The structure of the compound were tried to establish by spectroscopic methods.

Study design

In order to carry out column chromatography, a solvent system was established by developing TLC technique. The silica gel (100-200 mesh size) slurry was made with the solvent system established earlier.

Key words: blood glucose, *Leptadenia reticulata* [W&A], flavonoids

Received: February 23, 2015; Accepted: March 12, 2015; Published: March 15, 2015
The slurry was poured time to time into the column very carefully and the silica gel was allowed to settle down to from a uniform packing. Then the stop-cock of the column was opened and the excess of solvent over the column head was allowed to run. The dry crude ethanol extract (10g) was mixed with small amount of silica gel in a mortar to get a free flowing powder. The powdered sample was then applied carefully on the top of the prepared column and successfully eluted with solvent/solvent system using various solvent systems such as benzene, benzene: chloroform, chloroform: methanol, methanol: ethanol and ethanol alone to separate the eluate. The eluate with same R\text{f} value are pooled together and evaporated to dryness. When the mixture of solvent system used, the ratio of mixtures are prepared as 90:10, 80:20, 70:30, 60:40, 50:50, 40:60, 30:70, 20:80 and 10:90. Elutes were collected in a number of conical flasks marked from fractions 1-100. Elutes were spotted successfully on TLC plate and the flasks having similar spots number of conical flasks marked from fractions 1-100. Elutes were collected in a solvent system using various solvent systems such as benzene, benzene: chloroform, chloroform: methanol, F 109–135 using methanol alone, F 136–174 using methanol: ethanol finally ethanol alone is used the eluate F 175–200. The volume of each eluate is 50 ml. The eluates with same R\text{f} value were pooled together and evaporated to dryness. The pooled fraction of DVLR such as F 1–24, F 25–54, F 55–81, F 82–108, F 109–135, F 136–174 and F 175–200 are named as A, B, C, D, E, F and G respectively. The pooled eluates of A, B, C, D, E, F, G were tested in fasting blood glucose level in streptozotocin induced diabetic rats.

Effect of ETLR on FBG and lipid profile in diabetic rats

Various isolated fractions of ETLR (100mg/kg) were evaluated for their anti-diabetic effect in fed with high energy diet of 20% sucrose and 10% lard. The STZ was freshly dissolved in citrate buffer (0.01mol/L, pH 4.5) and kept on ice prior to use. One week later STZ inductions of diabetes in wistar rats, the fasting blood glucose levels were measured [9]. The hyperglycemic rats (blood glucose >240mg/dl) were divided into 10 groups (each with 3 rats). Distilled water, metformin and various isolated fractions of ETLR (100mg/kg) daily administered orally to normal control, diabetic control and the treatment groups respectively for 3 weeks.

Purification of pooled column fraction of ETLR by column chromatography

From the study it was observed that the fraction "D" showed significant (P<0.05) decrease in blood glucose but the other fractions did not show significant effect of blood glucose when compared with normal control. The results of the effect of various isolated fractions of ETLR (100mg/kg) on the blood glucose level in STZ induced diabetic rats are shown in Table 1.

Characterization of compounds using various analytical techniques

IR Studies with LR – 1: The IR spectra exhibit characteristic absorption band at 1617.31cm\(^{-1}\) which shows that the compound possesses -OH bending and a C=O stretching is present at 1669.53cm\(^{-1}\).

Table 1. Effect of Various Isolated Fractions of ETLR (100 mg/kg) on the Blood Glucose Level in STZ Induced Diabetic Rats.

| Treatment        | Fasting blood glucose (mg/dl) |
|------------------|-------------------------------|
|                  | 0 day | 7th day | 14th day | 21st day |
| Normal control   | 78.4 ± 3.7 | 77.9 ± 4.2 | 78.5 ± 2.7 | 76.6 ± 3.6 |
| Diabetic control | 67.3 ± 5.8 | 261.8 ± 5.3 | 259.3 ± 4.8 | 251.4 ± 2.8 |
| Fraction – A     | 72.3 ± 2.7 | 263.4 ± 4.6 | 214.8 ± 2.6 | 189.4 ± 4.6 |
| Fraction – B     | 78.8 ± 5.4 | 258.3 ± 2.8 | 226.6 ± 4.9 | 172.3 ± 5.7 |
| Fraction – C     | 79.9 ± 8.5 | 261.8 ± 1.9 | 219.5 ± 3.7 | 165.4 ± 3.2 |
| Fraction – D     | 83.4 ± 6.8 | 249.9 ± 7.4 | 162.7 ± 5.3 | 91.4 ± 7.4* |
| Fraction – E     | 74.5 ± 5.1 | 252.2 ± 3.5 | 198.4 ± 1.9 | 146.8 ± 2.6 |
| Fraction – F     | 76.7 ± 4.7 | 245.6 ± 5.7 | 187.5 ± 6.5 | 156.7 ± 6.1 |
| Fraction – G     | 75.3 ± 3.6 | 259.4 ± 6.2 | 191.1 ± 3.9 | 140.5 ± 5.3 |
| Metformin        | 80.3 ± 3.4 | 251.4 ± 5.5 | 142.3 ± 3.1 | 87.4 ± 6.1* |

| 5.    | Ethyl acetate (100)                  | F 21 – F 26 | 300                        | Methanol: Ethyl acetate: Acetic acid (10: 20: 70) |                     |
| 6.    | Methanol: Ethyl acetate (10: 90)     | F 27 – F 33 | 300                        | Methanol: Ethyl acetate: Acetic acid (10: 20: 70) |                     |
| 7.    | Methanol: Ethyl acetate (20: 80)     | F 34 – F 35 | 300                        | Methanol: Ethyl acetate: Acetic acid (10: 20: 70) |                     |
| 8.    | Methanol: Ethyl acetate (50: 50)     | F 36 – F 37 | 300                        | Methanol: Ethyl acetate: Acetic acid (10: 20: 70) |                     |
| 9.    | Methanol alone                        | F 38 – F 40 | 100                        | Methanol: Ethyl acetate: Acetic acid (10: 20: 70) | Amorphous powder with decomposition point * |

* is the compound from the fractions of (F36 – 37) named as LR – 1

Figure 1. IR Spectrum of the Compound LR-1 from ETLR

The IR spectra exhibit characteristic absorption band at 3227.84 cm\(^{-1}\) which shows that the aromatic –CH stretching and 3420.22 cm\(^{-1}\) which shows that –OH stretching. The spectrum of the compound is given in Figure 1.

\(^{13}\)C-NMR Studies with LR–1: From the spectra it was observed that the \(^{13}\)C-NMR showed 22 signals. It revealed that the chemical shift was observed at δ93.91 ppm, δ98.80 ppm (Aliphatic C=C), δ115.38–δ164.18 ppm (Aromatic carbon) δ206.96 ppm (–C=O) and δ144.58–δ164.18 ppm (Aromatic ipso carbon). The spectrum of the compound is given in Figure 2.

\(^{1}H\)-NMR Studies with LR–1: From the spectra, it was observed that –OH at δ6.94, δ6.97, δ1.00, δ1.03 ppm. Aromatic –CH observed that δ6.96 – δ7.78 ppm. The spectrum of the compound is given in Figure 3.

Mass spectrum studies with LR–1: From the mass spectrum of LR–1, it was observed that a molecular ion signal m/z=201.18. The observed fragmentation pattern shows the similarity of a compound having an aromatic origin. The spectrum of the compound is given in Figure 4.

Discussion

Now a day, the interest in the study of natural product is growing rapidly, especially as a part of drug discovery programs. In our previous studies proved that the anti-diabetic activities are associated with the active constituents of ETLR [8]. In continuation to the previous study, we have shown interest to isolate the pure constituents responsible for the above mentioned pharmacological action. An attempt was made to isolate the purified compounds responsible for anti-diabetic activity using column chromatography technique with ETLR. The fraction “D” from ETLR showed strong anti-diabetic activity on a par with the standard drug metformin. To ensure the compounds responsible for anti-diabetic activities associated with “D” respectively, in addition a column chromatographic analysis was carried out with “D” using various solvent systems. We isolated one compound named as LR-1 from the column which were amorphous powders with decomposition point; however LR-1 was phenolic compound nature (Flavonoids) confirmed by spectral analysis. At present, the exact Mechanism of action of the isolated fraction of LR-1 is not yet known and will be the subject of further studies.
