1. Introduction

Throughout this paper, we adopt the conventional symbols, D = {z : |z| < 1} and B(z, r), to denote the unit disk in the extended complex plane C and the disk with center z and radius r, respectively. Moreover, use S 1 = ∂D to denote the boundary of D.

A complex-valued function f is said to be complex-valued harmonic in D if the real part and the imaginary part of f are real harmonic in D. Notice that every complex-valued harmonic function f can be written as f = h + ˜g, where both g and h are analytic in D. Moreover, a complex-valued harmonic function f is called to be locally univalent if its Jacobian determinant

\[ J_f = |f_z|^2 - |f_{\bar{z}}|^2 = |h'|^2 - |g'|^2 \]  

(1)
do not vanish in D. It follows that if f is locally univalent, then f is either sense-preserving or sense-reversing depending on the conditions J f > 0 and J f < 0 in D, respectively.

Notice that if f is sense-preserving, then ˜f is sense-reversing. Let \( \omega = g'/h' \) be the (second complex) dilatation of \( f = h + ˜g \). It follows from [1] that, if a locally univalent harmonic function \( f = h + ˜g \) is sense-preserving, then its analytic part h is locally univalent and \( \omega = g'/h' \) is analytic with |\( \omega \) < 1. Moreover, a locally univalent harmonic function f is univalent if f is injective.

Recall that the harmonic pre-Schwarzian derivative \( P_H \) of a locally univalent harmonic function f with \( J_f \) is defined by

\[ P_H(f) = \frac{\partial}{\partial z} \log J_f = \frac{h''}{h'} - \frac{\bar{\omega}\omega'}{1-|\omega|^2}, \]  

(2)
and the harmonic Schwarzian derivative \( S_H \) [2-4] is defined as

\[ S_H(f) = \frac{\partial}{\partial z} P_H(f) - \frac{1}{2} P_H^2(f) = S(h) + \frac{\bar{\omega}}{1-|\omega|^2} \left( \frac{h''\omega'}{h'} - \omega'' \right) \]  

\[ - \frac{3}{2} \left( \frac{\bar{\omega}\omega'}{1-|\omega|^2} \right)^2. \]  

(3)
that both the pre-Schwarzian derivative and the Schwarzian derivative are well-defined for the locally univalent harmonic function (sense-preserving or sense-reversing) in $\mathbb{D}$.

Now, we shall introduce some basic concepts concerning the Fuchsian group. Firstly, a Möbius transformation of $\mathbb{D}$ is defined by

$$A(z) = e^{\theta} \frac{z - a}{1 - az}, a \in \mathbb{D}, \theta \in [0, 2\pi).$$

A Fuchsian group is a discrete Möbius group $G$ acting on the unit disk $\mathbb{D}$. For a Fuchsian group $G$, it is cocompact if $\mathbb{D}/G$ is compact and is convex cocompact if $G$ is finitely generated without parabolic elements. Furthermore, a Fuchsian group $G$ is of the first kind if its limit set is $S^1$; otherwise, it is of the second kind. Notice that all cocompact groups are the first kind and convex cocompact groups minus cocompact groups are the second kind.

A finitely generated Fuchsian group $G$ is called to be of divergence type if

$$\sum_{g \in G} (1 - |g(0)|) = \coor \sum_{g \in G} \exp (-\rho(0, g(0))) = \infty$$

and to be of convergence type otherwise, where $\rho(\cdot, \cdot)$ is the hyperbolic distance. We know that all finitely generated Fuchsian groups of the second kind are of convergence type. For more details about Fuchsian groups, see [5].

On the basis of the above definitions, we call a locally univalent harmonic function $f$ compatible with a Fuchsian group $G$ if and only if $f \circ A = f$, for any $A \in G$. Correspondingly, the Schwarzian derivative $S_H(f)$ is called a $G$-compatible Schwarzian derivative if $f$ is a $G$-compatible locally univalent harmonic function. Since

$$S_{H}(f \circ A) = (S_{H}(f) \circ A) \cdot \left( A^{'} \right)^{2},$$

then a $G$-compatible Schwarzian derivative $S_{H}(f)$ should satisfy

$$S_{H}(f) = (S_{H}(f) \circ A) \cdot \left( A^{'} \right)^{2}, A \in G.$$  

A positive measure $\lambda$, defined on a simply connected domain $\Omega$, is called a Carleson measure if there exists a positive constant $C$, independent of $r$, such that for all $0 < r < \text{diameter}(\partial \Omega)$ and $z \in \partial \Omega$,

$$\lambda(\Omega \cap B(z, r)) \leq Cr.$$  

The Carleson norm $\|\lambda\|_\Omega$ of $\lambda$ is defined by

$$\|\lambda\|_\Omega = \sup \left\{ \frac{\lambda(\Omega \cap B(z, r))}{r} : z \in \partial \Omega, 0 < r < \text{diameter}(\Omega) \right\} < \infty.$$  

Denote by $\text{CM}(\Omega)$ the set of all Carleson measures on $\Omega$. Correspondingly, $\text{CM}(\mathbb{D})$ is the set of all Carleson measures on $\mathbb{D}$. For more details, see [6].

Let $\mathcal{F}$ be the Dirichlet fundamental domain of a Fuchsian group $G$ in $\mathbb{D}$ centered at $z = 0$ and $\mathcal{F}(\infty)$ be the boundary at infinity of $\mathcal{F}$. Hua [7] considered a Beltrami coefficient $\mu$ in $\mathbb{D}$ compatible with a finitely generated Fuchsian group $G$ of the second kind and showed that if $((\mu)(1 - |z|^{2})1 - |z|^{2})dx\,dy$ satisfies the Carleson condition on $\mathcal{F}(\infty)$, then $(\mu)(1 - |z|^{2})1 - |z|^{2})dx\,dy$ is a Carleson measure in $\mathbb{D}$. Naturally, one may ask whether it is right for the Schwarzian derivative $S_{H}(f)$ of a $G$-compatible locally univalent harmonic function or not. For the case of a $G$-compatible univalent harmonic function, the following theorem will give an affirmation of the above problem.

**Theorem 1.** Let $G$ be any finitely generated Fuchsian group of the second kind and $\mathcal{F}$ be the Dirichlet fundamental domain of $G$ centered at $0$. For a $G$-compatible univalent harmonic function $f$, if there exists a constant $C > 0$ such that, for any $\xi \in \mathcal{F}(\infty)$ and any $0 < r < 2$,

$$\int_{B(\xi, r)} |S_{H}(f)|^{2} (1 - |z|^{2})^{3} \chi_{\mathcal{F}} \, dx\,dy \leq Cr,$$

then $|S_{H}(f)|^{2} (1 - |z|^{2})^{3} \, dx\,dy$ is in $\text{CM}(\mathbb{D})$, where $\chi_{\mathcal{F}}$ is the characteristic function of $\mathcal{F}$.

The rest of this paper is organized as follows. In Section 2, we give some related lemmas. In Section 3, we divide two parts to give the proof of Theorem 1.

### 2. Some Lemmas

The following lemma is used several times in this paper, and we shall give a short proof in this section.

**Lemma 2.** Suppose that $f$ is a univalent harmonic function in $\mathbb{D}$. If

$$|S_{H}(f)|^{2} (1 - |z|^{2})^{3} \, dx\,dy \in \text{CM}(\mathbb{D}),$$

then there exists a constant $C > 0$ such that, for any $\xi \in \mathbb{D}$ and $0 < r < 2$,

$$\int_{B(\xi, r) \cap \mathbb{D}} |S_{H}(f)|^{2} (1 - |z|^{2})^{3} \, dx\,dy \leq Cr,$$

where $C$ depends only on the Carleson norm of $|S_{H}(f)|^{2} (1 - |z|^{2})^{3} \, dx\,dy$.

**Proof.** Choose $0 < r < 2$ and fix it. For any $\xi \in \mathbb{D}$, if $\xi \in \partial \mathbb{D}$, it is obviously right. For $\xi \in \mathbb{D}$, if the Euclidean distance $\text{dist}(\xi, \partial \mathbb{D}) \geq 2r$ (this case only happens when $0 < r < 1/2$), then, by
Theorem 5 of [1], we have
\[
\int_{\mathcal{B}(\xi,r)} |S_H(f)|^2 (1 - |z|^2)^3 d\mu \leq \int_{\mathcal{B}(\xi,r)} \frac{C_1}{1 - |z|^2} d\mu
\leq \frac{C_1 \pi r^2}{1 - |1 - r|^2} = \frac{C_1 \pi r^2}{2 - r} \leq C_2 r,
\]
where \( C_1 \) and \( C_2 \) are universal positive constants.

In the case of \( \text{dist}(\xi, \partial \mathbb{D}) < 2r \), we can choose a point \( \eta \in \partial \mathbb{D} \) such that \( \text{dist}(\eta, \xi) < 2r \). Then, we have \( B(\xi, r) \subset B(\eta, 4r) \) and
\[
\int_{\mathcal{B}(\xi,r)} |S_H(f)|^2 (1 - |z|^2)^3 d\mu \leq \int_{\mathcal{B}(\eta,r)\cap \partial \mathbb{D}} |S_H(f)|^2 (1 - |z|^2)^3 d\mu
\leq 4C^* r,
\]
where \( C^* \) is the Carleson norm of the measure \( |S_H(f)|^2 (1 - |z|^2)^3 d\mu \).

Therefore, set \( C = \max \{ C_2, 4C^* \} \) and the proof of this lemma is complete.

By the above lemma, we know that for any simply connected domain \( \mathcal{D} \subset \mathbb{D} \), if \( |S_H(f)|^2 (1 - |z|^2)^3 d\mu \) is a Carleson measure on \( \mathbb{D} \), then it is also a Carleson measure on \( \mathcal{D} \).

Lemma 3. Let \( G \) be a convergence-type Fuchsian group and \( f \) be a \( G \)-compatible univalent harmonic function. If there exists \( 0 < t < 1 \) such that the support set of \( S_H(f) \chi_\mathcal{D} \) is contained in \( B(0, t) \), then \( S_H(f) \chi_\mathcal{D} \) is analytic in \( B(0, t) \), and \( \mu_B^{\mathcal{D}} \) is analytic in \( B(0, t) \), where \( \mathcal{D} \) is the Dirichlet mass at \( z \).

Huo [7] has shown that the sequence \( \{g(0)\}_{g \in G} \) is an interpolating sequence of \( \mathbb{D} \), if it satisfies the following two conditions:
\[
\exists \eta > 0, \rho(z_j, z_k) \geq \eta \quad \text{for } j \neq k,
\]
\[
\sum (1 - |z_j|^2) \delta_z_j \in \text{CM}(\mathbb{D}),
\]
where \( \delta_z \) stands for the Dirac mass at \( z \).

Note that the hyperbolic radius \( r_\rho \) of the Euclidean disk \( B(0, t) \) is \( \ln \left( (1 + t^2) t / (1 - t^2) / (1 - t) \right) \). Therefore, for any \( g \in G \), the disk \( g(B(0, t)) \) is a hyperbolic disk with center \( g(0) \) and hyperbolic radius \( t_\rho \). By [8], we know that \( g(B(0, t)) \) is contained in the Euclidean disk \( B(g(0), R_g) \) and \( R_g \leq C_3 (1 - |g(0)|) \), where \( C_3 \) is a constant depending on \( t \).

Combined with the above discussion, we have
\[
L \leq \sum_{g(0) \in B(\xi,r)} \frac{CnR_g^2}{1 - |1 - R_g|^2} \leq C_4 \sum_{g(0) \in B(\xi,r)} (1 - |g(0)|) \leq C^* r,
\]
where \( C^* \) depends on \( C_3, C_4 \) and the Carleson norm of the measure \( \sum_{g \in G} (1 - |g(0)|) \delta_{g(0)} \).

Lemma 4 [9]. Let \( \Omega \) be a chord-arc domain. Then, the following statements are equivalent:
1. \(d\mu \) is a Carleson measure in \( \Omega \)
2. For \( 0 < p < \infty \), \( f \in H^p(\Omega) \), we have
\[
\int_\Omega |f|^p d\mu \leq C \int_\Omega |f|^p ds,
\]
where \( H^p(\Omega) = \{ f : f \) is analytic in \( \Omega \) and \( \int_\Omega |f|^p ds < \infty \} \) and \( C \) only depends on the Carleson norm of \( d\mu \).

3. Proof of Theorem 1

In order to prove Theorem 1, we divide two parts for the finitely generated Fuchsian group of the second kind \( G \) as follows: the first case is to consider the finitely generated Fuchsian group of the second kind \( G \) without any parabolic element; the second case is to discuss the finitely generated Fuchsian group of the second kind \( G \) with some parabolic elements.

Theorem 5. Let \( G \) be a finitely generated Fuchsian group of the second kind without any parabolic element and \( \mathcal{F} \) be the Dirichlet fundamental domain of \( G \) centered at 0. For a \( G \)-compatible univalent harmonic function \( f \), if there exists a constant \( C > 0 \) such that, for any \( \xi \in \mathcal{F}(\infty) \) and any \( 0 < r < 2 \),
\[
\int_{\mathcal{B}(\xi,r)} |S_H(f)|^2 (1 - |z|^2)^3 \chi_\mathcal{D} d\mu \leq Cr,
\]
then \( |S_H(f)|^2 (1 - |z|^2)^3 d\mu \) is in \( \text{CM}(\mathbb{D}) \), where \( \chi_\mathcal{D} \) is the characteristic function of the Dirichlet fundamental domain \( \mathcal{F} \).

Proof. Let \( G \) be a finitely generated Fuchsian group of the second kind without any parabolic element and \( \mathcal{F} \) be the Dirichlet domain of \( G \) with center 0. Let \( f \) be a \( G \)-compatible univalent harmonic function. Then, the intersection of the closure of \( \mathcal{F} \) with \( \partial \mathbb{D} \) contains finitely many intervals which are called free edges of \( \mathcal{F} \), denoted by \( I_1, I_2, \cdots, I_n \).
For any $1 \leq i \leq n$, let $q_{i1}, q_{i2}$ be the endpoints of $I_i$. It is known that both $q_{i1}, q_{i2}$ do not belong to the limit set. Both sides of $q_i(j = 1, 2)$ are free sides of Dirichlet fundamental domains with different centers.

By the statement of the theorem, there exists a constant $C > 0$ such that, for $1 \leq i \leq n$, choose a ball $B_i$ such that $B_i \cap \partial D$ contains no limit points of $G$, and $I_i \subset B_i \cap \partial D$. Then, for any point $\xi \in I_i$, $0 < r < 2$, we have

$$\int_{B(\xi,r) \cap D} |S_{H}(f_i)|^2 (1 - |z|^2)^3 \, dx \, dy \leq C r. \quad (20)$$

Furthermore, the set $F = F - \bigcup_{i=1}^{m} (B_i \cap F)$ is compact, where $F$ is the closure of $F$.

By Lemma 2, we know that $|S_{H}(f)|^2 (1 - |z|^2)^3 \, dx \, dy$ is a Carleson measure in $B_i \cap F$.

We shall now divide $f$ into two parts $f_1, f_2$,

$$f_1 = \sum_{g \in G} f_{g}(\xi) \cdot f_2 = \sum_{g \in G} f_{g}(B_i), \quad (21)$$

where $B = \bigcup_{i=1}^{m} (B_i \cap F)$. By Lemma 3, we know that the measure $|S_{H}(f_i)|^2 (1 - |z|^2)^3 \, dx \, dy$ is a Carleson measure on $D$. Next, we only need to show that $|S_{H}(f_i)|^2 (1 - |z|^2)^3 \, dx \, dy$ is also a Carleson measure.

Let $\xi$ be an arbitrary point on $\partial D$ and $0 < r < 2$. In the following proof, we will find a positive constant $C^*$ which does not depend on $\xi$ and $r$ such that

$$\int_{B(\xi,r) \cap D} |S_{H}(f_i)|^2 (1 - |z|^2)^3 \, dx \, dy \leq C^* r. \quad (22)$$

We first consider one special case: there exists $g \in G$ such that $g(B(\xi, r) \cap D) \subset F$. By Lemma 2, we know that $|S_{H}(f_i)|^2 (1 - |z|^2)^3 \, dx \, dy$ is a Carleson measure on the domain $g(B(\xi, r) \cap D)$. Then, we have

$$\int_{g(B(\xi,r) \cap D)} |S_{H}(f_i)(w)|^2 (1 - |w|^2)^3 \, dv \, dw$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |g^{-1}(z)|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |z|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |z|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |z|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$\leq C_3 \int_{\partial g(B(\xi,r) \cap D)} |g'(z)| \, ds \leq \pi C_3 \text{length}(g(B(\xi, r) \cap D)), \quad (23)$$

where the second above equality holds since

$$\frac{|g'(z)|}{1 - |g(z)|^2} \geq \frac{1}{1 - |z|^2} \quad \text{for any } g \in G. \quad (24)$$

Since $g$ is a Möbius transformation $g(B(\xi, r) \cap D)$ is a chord-arc domain, from Lemma 4, we have

$$\int_{g(B(\xi,r) \cap D)} |S_{H}(f_i)(w)|^2 (1 - |w|^2)^3 \, dv \, dw \leq C_4 \int_{g(B(\xi,r) \cap D)} |(g^{-1})'|^2(z) \, dx \, dy$$

where $C_3$ depends only on the the Carleson norm. Hence, we have

$$\int_{B(\xi,r) \cap D} |S_{H}(f_i)(w)|^2 (1 - |w|^2)^3 \, dv \, dw \leq 2\pi C_3 r. \quad (25)$$

For any $1 \leq i \leq n$, since $B_i \cap \partial D$ contains no limit points of $G$ and there are finitely many $g_1, \ldots, g_m$ belonging to $G$ such that

$$(B_i \cap D) \subset \bigcup_{1}^{m} g_j(\partial F), \quad (27)$$

then we can get that the measure $|S_{H}(f_i(z))|^2 (1 - |z|^2)^3 \, dx \, dy$ is a Carleson measure on $B_i \cap D$.

Now, we consider the general case. Let $G^*$ be the set of all the elements $g$ in $G$ such that $g(B) \cap B(\xi, r) \neq \emptyset$. When $g \in G^*$, there are at most three possibilities as follows:

(a) There exists $1 \leq i \leq n$, $g(B_i) \cap B(\xi, r) \neq \emptyset$ and $g(I_i) \subset B(\xi, r) \cap \partial D$

(b) There exists $1 \leq i \leq n$, $g(B_i) \cap B(\xi, r) \neq \emptyset$ and $g(I_i) \subset B(\xi, r) \cap \partial D$

(c) There exists $1 \leq i \leq n$, $g(B_i) \cap B(\xi, r) \neq \emptyset$ and $g(I_i) \cap B(\xi, r) \cap \partial D \neq \emptyset$.

In Case (a), we have

$$\int_{g(B(\xi,r) \cap D)} |S_{H}(f_i)(w)|^2 (1 - |w|^2)^3 \, dv \, dw$$

$$\leq \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i)(w)|^2 (1 - |w|^2)^3 \, dv \, dw$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |g^{-1}(z)|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |z|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |z|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$= \int_{g(B(\xi,r) \cap D)} |S_{H}(f_i \circ g(z))(w)|^2 (1 - |z|^2)^3 \, (|g^{-1})'|^2(z))^2 \, dx \, dy$$

$$\leq C_3 \int_{\partial g(B(\xi,r) \cap D)} |g'(z)| \, ds \leq \pi C_3 \text{length}(g(B(\xi, r) \cap D)), \quad (28)$$

where the second above inequality holds by Lemma 4 and $C_3$ only depends on the Carleson norm of $|S_{H}(f_i(z))|^2 (1 - |z|^2)^3 \, dx \, dy$ on $B_i \cap D$.
For Case (b), we have
\[
\iint_{g(B\cap \Omega)\cap B(\xi, r)} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv
\leq \iint_{g(B\cap \Omega)\cap B(\xi, r)} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv
\leq \pi C_3 \text{length}(B(\xi, r) \cap \partial D).
\]

For Case (c), notice that \( g(B, \cap D) \cap B(\xi, r) \) is a triangle with three circle arcs and the angle corresponding to the side \( g(B, \cap \partial D) \cap B(\xi, r) \) is bigger than some constant. Thus, we have
\[
\text{length}(\partial (g(B, \cap D) \cap B(\xi, r))) \leq C_3 \text{length}(g(B, \cap \partial D) \cap B(\xi, r)),
\]
where \( C_3 \) depends on the Carleson norm of \( |S_H(f_2)|^2 \) \( (1 - |z|^2)^2 dx dy \) on \( B, \cap D \) and the angle between \( \partial B_1 \) and \( \partial D \).

Similar to Case (a), we have
\[
\iint_{g(B(\cap \Omega)\cap B(\xi, r))} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv
\leq \pi C_3 \text{length}(g(B, \cap \partial D) \cap B(\xi, r)).
\]

For any \( 1 \leq i \leq n \), the arc \( B_i \cap \partial D \) does not contain the limit points of \( G \). Therefore, for any \( g_1, g_2 \in G \), if \( g_1(B) \cap B(\xi, r) \neq \emptyset \) and \( g_2(B) \cap B(\xi, r) \neq \emptyset \), then the images of \( B_i \cap \partial D \) under \( g_1, g_2 \) do not overlap. Thus, we have
\[
\iint_{B(\xi, r)\cap \partial D} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv
\leq \pi C_3 \sum_{g \in G} \text{length}(g(B) \cap B(\xi, r) \cap \partial D)
\leq \pi C_3 \text{length}(B(\xi, r) \cap \partial D) \leq 2\pi r^2 C^* r,
\]
where \( C^* \) equals to the maximum value of the constants, appearing in the proof of this theorem, and \( B = \bigcup_{i=1}^n (B_i \cap \Omega) \).

The proof of this theorem is complete.

**Theorem 6.** Let \( G \) be a finitely generated Fuchsian group of the second kind with some parabolic elements and \( \mathcal{F} \) be the Dirichlet fundamental domain of \( G \) centered at \( 0 \). For a \( G \)-compatible univalent harmonic function \( f \), if there exists a constant \( C > 0 \) such that, for any \( \xi \in \mathcal{F}(\infty) \) and any \( 0 < r < 2 \),
\[
\iint_{B(\xi, r)} |S_H(f)|^2 (1 - |z|^2)^3 \chi_\mathcal{F} dxdy \leq Cr,
\]
then \( |S_H(f)|^2 (1 - |z|^2)^3 \chi_\mathcal{F} dxdy \) is in \( CM(D) \), where \( \chi_\mathcal{F} \) is the characteristic function of the Dirichlet fundamental domain \( \mathcal{F} \).

**Proof.** Let \( G \) be a finitely generated Fuchsian group of second kind with some parabolic elements. Without loss of generality, suppose that the generator of \( G \) contains only one parabolic element \( \gamma \) and \( \xi \in \mathcal{F}(\infty) \) is one fixed point of \( \gamma \).

Similar to the proof of Theorem 5, we divide \( f \) into two parts \( f_1, f_2 \) as follows:
\[
f_1 = \sum_{g \in G} f_{g|\mathcal{F}}(f), f_2 = \sum_{g \in G} f_{g|\mathcal{F}}(f).
\]

where \( \mathcal{F} = \mathcal{F} - (B \cap \mathcal{F}) \) and \( B \) is a sufficiently small disk with center \( \xi \) and radius \( r_0 \) such that \( \partial B \) intersects with the sides of \( \mathcal{F} \) having \( \xi \) as a common vertex. Let \( \gamma_0 \) be the arc of \( \partial B \) between the sides of \( \mathcal{F} \) which have \( \xi \) as a common vertex.

By Theorem 5, we know that \( |S_H(f_1(z))|^2 (1 - |z|^2)^3 dx dy \) for any \( \gamma \in CM(D) \). Then, we only need to show that \( |S_H(f_2(z))|^2 (1 - |z|^2)^3 dx dy \) is a Carleson measure in \( D \).

For any \( g \in G \), we have
\[
\iint_{B(\xi, r)\cap \partial D} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv
\leq \iint_{B(\xi, r)\cap \partial D} \frac{C_1}{|1 - |w|/z|^2} dudv = \iint_{B(\xi, r)\cap \partial D} \frac{C_1}{|1 - |w|/z|^2} dxdy
\leq C_2 (1 - |\gamma_0(z_0)|^2) \iint_{B(\xi, r)\cap \partial D} \frac{1}{(1 - |z|^2)^3} dxdy \leq C(1 - |\gamma_0(z_0)|^2),
\]
where \( z_0 \) is any point in \( \gamma_0 \). The first above inequality holds by Theorem 5 of [1], and the second and final above equalities hold by
\[
\frac{|\gamma'(z)|}{1 - |\gamma(z)|^2} = \frac{1}{1 - |z|^2}
\]
for any \( g \in G \). (36)

In the second above inequality, the hyperbolic length of \( \gamma_0 \) is finite, where \( C_2 \) depends on \( z_0 \) and the hyperbolic length of \( \gamma_0 \). In the final inequality, the finiteness of the hyperbolic area of \( B \cap \mathcal{F} \) is given by Theorem 1.2 in [7].

Let \( \eta \) be any point in \( \mathcal{D} \) and \( 0 < r < 1 \). By the proof of Lemma 2.2 in [7], we know that the sequence \( \{g(z_0)\} \) of \( G \) is an interpolating sequence. Therefore, we obtain that
\[
\sum_{g \in G} (1 - |g(z_0)|^2) \delta_{g(z_0)} \in CM(D),
\]
where \( \delta_z \) stands for the Dirac mass at \( z \). Thus, the images of \( B \cap \mathcal{F} \) under \( g \), contained in the disk \( B(\eta, r) \), satisfy
\[
\iint_{B(\eta, r)\cap \partial D} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv
\leq \sum_{g \in G} \iint_{B(\eta, r)\cap \partial D} |S_H(f_2(w))|^2 (1 - |w|^2)^3 dudv \leq Cr.
\]

Thus, the proof of the theorem is complete.
Proof of Theorem 1. Combining Theorem 5 and Theorem 6, the proof of Theorem 1 is complete.
