The potential of hexatungstotellurate(VI) to induce a significant entropic gain during protein crystallization

Christian Molitor, Aleksandar Bijelic and Annette Rompel
S1. Figures

Figure S1 Structures of $[\text{TeW}_6\text{O}_{24}]^{6-}$. TEW is shown in ball and stick (left) and polyhedra (right) representation. Color code: tungsten, cyan; tellurium; brown; oxygen, red.

Figure S2 Graphic representation of the ΔASA calculation results for all three structures of cgAUS1. The crystal contacts (ΔASA) of the respective crystal form were determined by AREAIMOL. The protein structures are shown as green cartoons, whereas the calculated crystal contacts are illustrated as red surfaces.
**Figure S3** Impact of TEW on the crystal packing of cgAUS1. Both TEW anions (GluTEW is the TEW ion which is covalently bound to a glutamic acid) strongly influence the crystal packing of cgAUS1 in CrystTEW, as both mediate new crystal contacts between symmetry related crystallographic dimers.

**Figure S4** Schematic illustration of the water release event upon TEW binding. Before the binding event both, TEW (or the additive in general) and the protein, are hydrated, that is, surrounded by a hydration shell (indicated by water molecules shown as small spheres with the red sphere being the oxygen atom and the white spheres being the hydrogen atoms). Upon TEW-protein binding, the release of water molecules from their hydration shells causes a gain in solvent entropy. The protein (cgAUS1) is shown as a green cartoon, which is surrounded by a grey transparent surface to illustrate the binding site of TEW and the crystal contact. TEW is illustrated in ball and stick representation with the following color code: tellurium, grey; tungsten, black; oxygen, red. The figure is inspired by Figure 3 from (Matsarskaia et al., 2016).
Figure S5 Structure of the Eu containing dipicolinate complexes.
**S2. Tables**

**Table S1**  Crystal contacts of all crystal forms of cgAUS1 calculated by PISA.

| Crystal form | Contact (by chain) | Contact area (PISA) | No. of contact residues (PISA) |
|--------------|--------------------|---------------------|--------------------------------|
| CrystTEW     | A-B<sup>b</sup>    | 726 Å²              | 50                             |
|              | A-A                | 350 Å²              | 33                             |
| Cryst1       | A-B<sup>b</sup>    | 690 Å²              | 44                             |
|              | C-D<sup>b</sup>    | 668 Å²              | 43                             |
|              | B-D                | 570 Å²              | 41                             |
|              | B-B                | 492 Å²              | 31                             |
|              | D-D                | 487 Å²              | 30                             |
|              | A-C                | 419 Å²              | 38                             |
| Cryst2       | C-E<sup>b</sup>    | 701 Å²              | 44                             |
|              | D-F<sup>b</sup>    | 683 Å²              | 46                             |
|              | B-H<sup>b</sup>    | 665 Å²              | 41                             |
|              | A-G<sup>b</sup>    | 629 Å²              | 40                             |
|              | D-H                | 630 Å²              | 51                             |
|              | C-G                | 572 Å²              | 47                             |
|              | E-E                | 490 Å²              | 32                             |
|              | B-B                | 483 Å²              | 30                             |
|              | F-F                | 471 Å²              | 29                             |
|              | A-A                | 466 Å²              | 27                             |

<sup>a</sup>Note that only the largest contacts (> 400 Å²) were considered, however, with exemption of CrystTEW where a smaller contact is shown due to the lack of further large/strong contacts.

<sup>b</sup>This crystal contact represents a crystallographic dimer building up each crystal form.
Table S2  ΔASA values of reference HEWL structures. Representatives chosen from every reported space group.

| Space group   | HEWL PDB 4LZT | HEWL PDB 1B2K | HEWL PDB 1PS5 | HEWL PDB 2FBB | HEWL PDB 1AKI | HEWL PDB 4WM6 | HEWL PDB 5EBH |
|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|
| Additive      | NO₃⁻          | I⁻           | SO₄²⁻         | NO₃⁻          | -             | -             | -             |
| No. of additives within interfaces | 5 of 6 | 9 of 17       | 1 of 2        | 9 of 16       | -             | -             | -             |
| Reference     | [(Walsh et al., 1998)] | [(Vaney et al., 2001)] | [(Majee et al., 2003)] | [(Brinkman n et al., 2006)] | [(Artym iuk et al., 1982)] | [(Yama da et al., 2015)] | [(Zander et al., 2016)] |

Crystal contacts of ASU\(^c\)

\[ ΔASA(ASU) \text{[Å}^2\] = \begin{align*}
\text{Per monomer [Å}^2\] &= \begin{cases}
-3256.7 \\
-2315.3
\end{cases}
\end{align*}

Crystal contacts within ASU\(^d\)

\[ ΔASA(\text{within ASU}) \text{[Å}^2\] = \begin{align*}
\text{Per monomer [Å}^2\] &= \begin{cases}
-831.8 \\
-347.4
\end{cases}
\end{align*}

Additive contribution to ΔASA per molecule [Å}^2\]

\[ ΔASA_{\text{total}} \text{[Å}^2\] = \begin{align*}
\text{Additive contribution to ΔASA per molecule [Å}^2\] &\approx \begin{cases}
-43.4 \\
-95.2
\end{cases}
\end{align*}

* The values in parentheses represent area differences without taking into account the additives by deleting them from the pdb file in order to analyse their impact on the crystal contacts.  
  \(^b\) ASU contains only one monomer.  
  \(^c\) Crystal contacts of ASU (ΔASA(ASU)) describes the contacts obtained by equation (1), that is, contacts between monomers originating from different ASUs (see Figure 1A).  
  \(^d\) Crystal contacts within ASU (ΔASA(\text{within ASU})) describes the contacts obtained by equation (2), that is, contacts between NCS mates (only necessary for ASUs containing more than one monomer) (Figure 1B).  
  \(^e\) ΔASA_{\text{total}} = ΔASA(ASU) + ΔASA(\text{within ASU}) as described in equation (3).  
  \(^f\) This value was obtained by simply subtracting the ΔASA_{\text{total}} per monomer value for the system ignoring the additive (value in parentheses) from that including the additive.

Please note that Table S2 is just a selection of the examined HEWL structures. Only one structure per space group is provided in order to show ΔASA values for all reported space groups. Commonly applied additives in HEWL structures are mostly different anions (e.g. NO₃⁻, I⁻, Br⁻, SCN⁻, Cl⁻, etc.), however, they do not significantly contribute to ΔASA and were therefore omitted.
### Table S3  Impact of different Eu(dpa)₃ complexes on ΔASA of HEWL due to crystal packing

| Space group | HEWL PDB 2PC2 | HEWL PDB 4BAD | HEWL PDB 4BAF | HEWL PDB 4BAP |
|-------------|---------------|---------------|---------------|---------------|
| Additive    | Eu(dpa)₃ complex 3<sup>a</sup> | Eu(dpa)₃ Complex 7<sup>c</sup> | Eu(dpa)₃ Complex 8<sup>c</sup> | Eu(dpa)₃ complex 9<sup>c</sup> |
| No. of additives within interfaces | 4 of 5 | 1 of 1 | 1 of 1 | 1 of 1 |
| Reference | [(Talon et al., 2012)] | [(Talon et al., 2012)] | [(Talon et al., 2012)] | [(Talon et al., 2012)] |

#### Crystal contacts of ASU<sup>d</sup>

| ASU<sup>d</sup> | ΔASA(ASU) [Å<sup>2</sup>] | Per monomer [Å<sup>2</sup>] |
|-----------------|--------------------------|-----------------------------|
| ΔASA(ASU) [Å<sup>2</sup>] | (-202.3)<sup>a</sup> | (-2361.4)<sup>a</sup> | (-2179.5)<sup>a</sup> | (-2301.2)<sup>a</sup> |
| Per monomer [Å<sup>2</sup>] | (-202.3)<sup>a</sup> | (-2361.4)<sup>a</sup> | (-2179.5)<sup>a</sup> | (-2301.2)<sup>a</sup> |

#### Crystal contacts within ASU<sup>d</sup>

| ΔASA(within ASU) [Å<sup>2</sup>] | Per monomer [Å<sup>2</sup>] |
|---------------------------------|-----------------------------|
| ΔASA(within ASU) [Å<sup>2</sup>] | <sup>b</sup> | <sup>b</sup> | <sup>b</sup> | <sup>b</sup> |
| Per monomer [Å<sup>2</sup>] | <sup>b</sup> | <sup>b</sup> | <sup>b</sup> | <sup>b</sup> |

#### ΔASA<sub>total</sub><sup>f</sup>

| ΔASA<sub>total</sub> [Å<sup>2</sup>] | Per monomer [Å<sup>2</sup>] |
|-----------------------------------|-----------------------------|
| ΔASA<sub>total</sub> [Å<sup>2</sup>] | (-202.3)<sup>a</sup> | (-2361.4)<sup>a</sup> | (-2179.5)<sup>a</sup> | (-2301.2)<sup>a</sup> |
| Per monomer [Å<sup>2</sup>] | (-202.3)<sup>a</sup> | (-2361.4)<sup>a</sup> | (-2179.5)<sup>a</sup> | (-2301.2)<sup>a</sup> |

**Additive contribution to ΔASA per molecule [Å<sup>2</sup>]**

| Additive contribution to ΔASA per molecule [Å<sup>2</sup>] | -533.5 | -712.7 | -811.6 | -968.7 |

---

<sup>a</sup> The values in parentheses represent area differences without taking into account the additives by deleting them from the pdb file in order to analyse their impact on the crystal contacts.  
<sup>b</sup> ASU contains only one monomer.  
<sup>c</sup> For structure see Figure S3.  
<sup>d</sup> Crystal contacts of ASU (=ΔASA(ASU)) describes the contacts obtained by equation (1), that is, contacts between monomers originating from different ASUs (see Figure 1A).  
<sup>e</sup> Crystal contacts within ASU (= ΔASA(within ASU)) describes the contacts obtained by equation (2), that is, contacts between NCS mates (only necessary for ASUs containing more than one monomer) (Figure 1B).  
<sup>f</sup> ΔASA<sub>total</sub> = ΔASA(ASU) + ΔASA(within ASU) as described in equation (3).  
<sup>g</sup> This value was obtained by simply subtracting the ΔASA<sub>total</sub> per monomer value for the system ignoring the additive (value in parentheses) from that including the additive.  

Please note that during the investigation of HEWL structures also other additives were found and analysed, however, they did not significantly contribute to ΔASA and were therefore omitted.
