Abstract. We consider a $q$-Painlevé III equation and a $q$-Painlevé II equation arising from a birational representation of the affine Weyl group of type $(A_2 + A_1)^{(1)}$. We study their hypergeometric solutions on the level of $\tau$ functions.

Key words: $q$-Painlevé system; hypergeometric function; affine Weyl group; $\tau$ function

2010 Mathematics Subject Classification: 33D05; 33D15; 33E17; 39A13

1 Introduction

We consider a $q$-analog of the Painlevé III equation ($q$-$P_{III}$) [8, 12, 13, 32]

\[ g_{n+1} = \frac{q^{2N+1}c^2}{f_n g_n} \left( 1 + a_0 q^n f_n \right), \quad f_{n+1} = \frac{q^{2N+1}c^2}{f_n g_{n+1}} \left( 1 + a_2 a_0 q^{n-m} g_{n+1} \right), \tag{1.1} \]

and that of the Painlevé II equation ($q$-$P_{II}$) [12, 30, 20]

\[ X_{k+1} = \frac{q^{2N+1}c^2}{X_k X_{k-1}} \left( 1 + a_0 q^{k/2} X_k \right), \tag{1.2} \]

for the unknown functions $f_n = f_n(m, N)$, $g_n = g_n(m, N)$, and $X_k = X_k(N)$ and the independent variables $n, k \in \mathbb{Z}$. Here $m, N \in \mathbb{Z}$ and $a_0, a_2, c, q \in \mathbb{C}^\times$ are parameters. These equations arise from a birational representation of the (extended) affine Weyl group of type $(A_2 + A_1)^{(1)}$.

Note that substituting \[ m = 0, \quad a_2 = q^{1/2}, \]

and putting \[ f_k(0, N) = X_{2k}(N), \quad g_k(0, N) = X_{2k-1}(N), \]

in (1.1) yield (1.2). This procedure is called a symmetrization of (1.1), which comes from the terminology used for Quispel–Roberts–Thompson (QRT) mappings [28, 29].

It is well known that the $\tau$ functions play a crucial role in the theory of integrable systems [19], and it is also possible to introduce them in the theory of Painlevé systems [5, 6, 7, 13, 21, 22, 24, 25, 26, 27]. A representation of the affine Weyl groups can be lifted on the level of the $\tau$ functions [10, 11, 33], which gives rise to various bilinear equations of Hirota type satisfied the $\tau$ functions.

The hypergeometric solutions of various Painlevé and discrete Painlevé systems are expressible in the form of ratio of determinants whose entries are given by hypergeometric type functions.
Usually, they are derived by reducing the bilinear equations to the Plücker relations by using the contiguity relations satisfied by the entries of determinants \cite{2,3,4,8,9,13,14,15,16,20,23,31}. This method is elementary, but it encounters technical difficulties for Painlevé systems with large symmetries. In order to overcome this difficulty, Masuda has proposed a method of constructing hypergeometric solutions under a certain boundary condition on the lattice where the $\tau$ functions live (hypergeometric $\tau$ functions), so that they are consistent with the action of the affine Weyl groups. Although this requires somewhat complex calculations, the merit is that it is systematic and that it can be applied to the systems with large symmetries. Masuda has carried out the calculations for the $q$-Painlevé systems with $E^7_1$ and $E^8_1$ symmetries \cite{17,18} and presented explicit determinant formulae for their hypergeometric solutions.

The purpose of this paper is to apply the above method to the $q$-Painlevé systems with the affine Weyl group symmetry of type $(A_2 + A_1)^{(1)}$ and present the explicit formulae of the hypergeometric $\tau$ functions. The hypergeometric $\tau$ functions provide not only determinant formulae but also important information originating from the geometry of lattice of the $\tau$ functions. The result has been already announced in \cite{12} and played an essential role in clarifying the mechanism of reduction from hypergeometric solutions of (1.1) to those of (1.2).

This paper is organized as follows: in Section 2, we first review hypergeometric solutions of $q$-P$_{III}$ and then those of $q$-P$_{II}$. We next introduce a representation of the affine Weyl group of type $(A_2 + A_1)^{(1)}$. In Section 3, we construct the hypergeometric $\tau$ functions of $q$-P$_{III}$ and those of $q$-P$_{II}$. We find that the symmetry of the hypergeometric $\tau$ functions of $q$-P$_{III}$ are connected with Heine’s transform of the basic hypergeometric series $2\varphi_1$.

We use the following conventions of $q$-analysis throughout this paper \cite{1}.

$q$-Shifted factorials:

$$(a; q)_k = \prod_{i=1}^{k} (1 - aq^{i-1}).$$

Basic hypergeometric series:

$$_s\varphi_r \left( \begin{array}{c} a_1, \ldots, a_s \\ b_1, \ldots, b_r \end{array} ; q, z \right) = \sum_{n=0}^{\infty} \frac{(a_1, \ldots, a_s; q)_n}{(b_1, \ldots, b_r; q)_n (q; q)_n} \left[ (-1)^n q^{n(n-1)/2} \right]^{1+r-s} z^n,$$

where

$$(a_1, \ldots, a_s; q)_n = \prod_{i=1}^{s} (a_i; q)_n.$$

Jacobi theta function:

$$\Theta(a; q) = (a; q)_\infty (qa^{-1}; q)_\infty.$$

Elliptic gamma function:

$$\Gamma(a; p, q) = \frac{(pqa^{-1}; p, q)_\infty}{(a; p, q)_\infty},$$

where

$$(a; p, q)_k = \prod_{i,j=0}^{k-1} (1 - p^i q^j a).$$

It holds that

$$\Theta(qa; q) = -a^{-1} \Theta(a; q), \quad \Gamma(qa; q, q) = \Theta(a; q) \Gamma(a; q, q).$$
2 q-P\textsubscript{III} and q-P\textsubscript{II}

2.1 Hypergeometric solutions of q-P\textsubscript{III} and q-P\textsubscript{II}

First, we review the hypergeometric solutions of q-P\textsubscript{III} and q-P\textsubscript{II}. The hypergeometric solutions of q-P\textsubscript{III} have been constructed as follows:

**Proposition 2.1** (\cite{ref}). The hypergeometric solutions of q-P\textsubscript{III}, (2.1), with \( c = 1 \) are given by

\[
\begin{align*}
  f_n &= -a_0 q^n \frac{\psi_{n,m}^{N+1} \psi_{m,n}^{N}}{\psi_{m,n}^{N+1} \psi_{n,m}^{N}}, \\
  g_n &= a_0^{-1} a_2 q^{m+n+1} \frac{\psi_{n,m}^{N+1} \psi_{m,n-1}^{N}}{\psi_{m,n-1}^{N} \psi_{n,m}^{N}},
\end{align*}
\]

where \( \psi_{n,m}^{N} \) \( (N \in \mathbb{Z}_{\geq 0}) \) is an \( N \times N \) determinant defined by

\[
\psi_{n,m}^{N} = \begin{vmatrix}
  F_{n,m} & F_{n+1,m} & \cdots & F_{n+N-1,m} \\
  F_{n-1,m} & F_{n,m} & \cdots & F_{n+N-2,m} \\
  \vdots & \vdots & \ddots & \vdots \\
  F_{n-N+1,m} & F_{n-N+2,m} & \cdots & F_{n,m}
\end{vmatrix}, \quad \psi_{0,0}^{N} = 1,
\]

and \( F_{n,m} \) is an arbitrary solution of the systems

\[
\begin{align*}
  F_{n+1,m} - F_{n,m} &= -a_0 q^{2n} F_{n,m-1}, \\
  F_{n,m+1} - F_{n,m} &= -a_2 q^{2m+2} F_{n-1,m}.
\end{align*}
\]

The general solution of (2.1) and (2.2) is given by

\[
F_{n,m} = \frac{A_{n,m}}{(a_2 q^{-2m+2}; q^2)_{\infty}} \varphi_1 \left( \begin{array}{c} 0 \\ a_2 q^{-2m+2} ; q^2, a_2 q^{-2n+2m} \end{array} \right) + B_{n,m} \frac{\Theta(a_0 q^{2m+2}; q^2)_{\infty} \Theta(a_0 q^{2n}; q^2)_{\infty}}{(a_0 q^{2m+2}; q^2)_{\infty}} \varphi_1 \left( \begin{array}{c} 0 \\ a_2 q^{-2m+2} ; q^2, a_2 q^{-2n+2m} \end{array} \right),
\]

where \( A_{n,m} \) and \( B_{n,m} \) are periodic functions of period one with respect to \( n \) and \( m \), i.e.,

\[
A_{n,m} = A_{n+1,m} = A_{n,m+1}, \quad B_{n,m} = B_{n+1,m} = B_{n,m+1}.
\]

The explicit form of the hypergeometric solutions of q-P\textsubscript{II} are given as follows:

**Proposition 2.2** (\cite{ref}). The hypergeometric solutions of q-P\textsubscript{II}, (2.2), with \( c = 1 \) are given by

\[
X_k = -a_0 q^{k/2+N} \frac{\phi_{k+1}^{N} \phi_{k-N}^{N+1}}{\phi_{k+2N-2}^{N} \phi_{k-N-1}^{N+1}}, \quad \phi_{k-N}^{N+1} = 1,
\]

where \( \phi_{n}^{k} \) \( (N \in \mathbb{Z}_{\geq 0}) \) is an \( N \times N \) determinant defined by

\[
\phi_{k-N}^{N+1} = \begin{vmatrix}
  G_k & G_{k-1} & \cdots & G_{k-N+1} \\
  G_{k+2} & G_{k+1} & \cdots & G_{k-N+3} \\
  \vdots & \vdots & \ddots & \vdots \\
  G_{k+2N-2} & G_{k+2N-3} & \cdots & G_{k+N-1}
\end{vmatrix}, \quad \phi_{0}^{k} = 1,
\]

and \( G_k \) is an arbitrary solution of the system

\[
G_{k+1} - G_k + a_0^{-2} q^{-k} G_{k-1} = 0.
\]
The general solution of (2.6) is given by

\[
G_k = A_k \Theta(i a_0 q^{(2k+1)/4}; q^{1/2}) \varphi_1 \left( \frac{0}{-q^{1/2}; q^{1/2}, -i a_0 q^{(3+2k)/4}} \right) + B_k \Theta(-i a_0 q^{(2k+1)/4}; q^{1/2}) \varphi_1 \left( \frac{0}{-q^{1/2}; q^{1/2}, i a_0 q^{(3+2k)/4}} \right),
\]

where \(A_k\) and \(B_k\) are periodic functions of period one, i.e.,

\[
A_k = A_{k+1}, \quad B_k = B_{k+1}.
\]

### 2.2 Projective reduction from \(q\)-P\(_{\text{III}}\) and \(q\)-P\(_{\text{IV}}\)

We formulate the family of Bäcklund transformations of \(q\)-P\(_{\text{III}}\) and \(q\)-P\(_{\text{IV}}\) as a birational representation of the affine Weyl group of type \((A_2 + A_1)^{(1)}\). Here, \(q\)-P\(_{\text{IV}}\) is a \(q\)-analog of the Painlevé \(IV\) equation discussed in [13]. We refer to [21] for basic ideas of this formulation.

We define the transformations \(s_i\) \((i = 0, 1, 2)\) and \(\pi\) on the variables \(f_j\) \((j = 0, 1, 2)\) and parameters \(a_k\) \((k = 0, 1, 2)\) by

\[
s_i(a_j) = a_j a_i^{-a_{ij}}, \quad s_i(f_j) = f_j \left( \frac{a_i + f_i}{1 + a_i f_i} \right)^{u_{ij}},
\]

\[
\pi(a_i) = a_{i+1}, \quad \pi(f_i) = f_{i+1},
\]

for \(i, j \in \mathbb{Z}/3\mathbb{Z}\). Here the symmetric \(3 \times 3\) matrix

\[
A = (a_{ij})^2_{i,j=0} = \begin{pmatrix} 2 & -1 & -1 \\ -1 & 2 & -1 \\ -1 & -1 & 2 \end{pmatrix},
\]

is the Cartan matrix of type \(A_2^{(1)}\), and the skew-symmetric one

\[
U = (u_{ij})^2_{i,j=0} = \begin{pmatrix} 0 & 1 & -1 \\ -1 & 0 & 1 \\ 1 & -1 & 0 \end{pmatrix},
\]

represents an orientation of the corresponding Dynkin diagram. We also define the transformations \(w_j\) \((j = 0, 1)\) and \(r\) by

\[
w_0(f_i) = \frac{a_i a_{i+1}(a_{i+1} a_i + a_i f_i + f_i)}{f_{i-1}(a_i a_{i+1} + a_i f_i + f_i f_{i+1})}, \quad w_0(a_i) = a_i,
\]

\[
w_1(f_i) = \frac{1 + a_i f_i + a_i a_{i+1} f_i f_{i+1}}{a_i a_{i+1} f_{i+1}(1 + a_i f_{i-1} + a_i a_{i-1} a_i f_{i-1} f_i)}, \quad w_1(a_i) = a_i,
\]

\[
r(f_i) = \frac{1}{f_i}, \quad r(a_i) = a_i,
\]

for \(i \in \mathbb{Z}/3\mathbb{Z}\).

**Proposition 2.3** ([13]). The group of birational transformations  \(\langle s_0, s_1, s_2, \pi, w_0, w_1, r \rangle\) forms the affine Weyl group of type \((A_2 + A_1)^{(1)}\), denoted by \(\tilde{W}((A_2 + A_1)^{(1)})\). Namely, the transformations satisfy the fundamental relations

\[
s_i^2 = (s_i s_{i+1})^3 = \pi^3 = 1, \quad \pi s_i = s_{i+1} \pi \quad (i \in \mathbb{Z}/3\mathbb{Z}),
\]

\[
w_0^2 = w_1^2 = r^2 = 1, \quad rw_0 = w_1 r,
\]

and the action of \(\tilde{W}(A_2^{(1)}) = \langle s_0, s_1, s_2, \pi \rangle\) and that of \(\tilde{W}(A_1^{(1)}) = \langle w_0, w_1, r \rangle\) commute with each other.
In general, for a function $F = F(a_i, f_j)$, we let an element $w \in \tilde{W}((A_2 + A_1)^{(1)})$ act as $w.F(a_i, f_j) = F(a_i, w, f_j, w)$, that is, $w$ acts on the arguments from the right. Note that $a_0a_1a_2 = q$ and $f_0f_1f_2 = qc^2$ are invariant under the action of $\tilde{W}((A_2 + A_1)^{(1)})$ and $\tilde{W}(A_2^{(1)})$, respectively. We define the translations $T_i$ ($i = 1, 2, 3, 4$) by

$$T_1 = \pi s_2s_1, \quad T_2 = s_1\pi s_2, \quad T_3 = s_2s_1\pi, \quad T_4 = rw_0,$$

(2.8)

whose action on parameters $a_i$ ($i = 0, 1, 2$) and $c$ is given by

$$T_1: (a_0, a_1, a_2, c) \mapsto (qa_0, qa^{-1}a_1, a_2, c),$$

$$T_2: (a_0, a_1, a_2, c) \mapsto (a_0, qa_1, qa^{-1}a_2, c),$$

$$T_3: (a_0, a_1, a_2, c) \mapsto (a_0, a_1, qa_2, c),$$

$$T_4: (a_0, a_1, a_2, c) \mapsto (a_0, a_1, a_2, qc).$$

Note that $T_i$ ($i = 1, 2, 3, 4$) commute with each other and $T_1T_2T_3 = 1$. The action of $T_1$ on the $f$-variables can be expressed as

$$T_1(f_1) = \frac{qc^2}{f_1f_0} + a_0f_0, \quad T_1(f_0) = \frac{qc^2}{f_0f_1} + a_2a_0T_1(f_1)$$

(2.9)

Or, applying $T_1T_2^mT_4^N$ ($n, m, N \in \mathbb{Z}$) on (2.3) and putting

$$f_{i,N}^{n,m} = T_1T_2^mT_4^N(f_i) \quad (i = 0, 1, 2),$$

we obtain

$$f_{1,N}^{n+1,m} = f_1^{n+1,m} = \frac{q^{2N+1}c^2}{f_1^{n+1,m}} + a_0q^n + f_0^{n+1,m}, \quad f_{0,N}^{n+1,m} = \frac{q^{2N+1}c^2}{f_0^{n+1,m}} + a_2a_0q^{n-m}f_1^{n+1,m}$$

which is equivalent to $q$-$\text{P}_{III}$. Then $T_1$ and $T_i$ ($i = 2, 4$) are regarded as the time evolution and Bäcklund transformations of $q$-$\text{P}_{III}$, respectively. We here note that we also obtain $q$-$\text{P}_{IV}$ by identifying $T_4$ as a time evolution [13].

In order to formulate the symmetrization to $q$-$\text{P}_{II}$, it is crucial to introduce the transformation $R_1$ defined by

$$R_1 = \pi^2s_1,$$

(2.10)

which satisfies

$$R_1^2 = T_1.$$

Considering the projection of the action of $R_1$ on the line $a_2 = q^{1/2}$, we have

$$R_1: (a_0, a_1, c) \mapsto (q^{1/2}a_0, q^{-1/2}a_1, c),$$

$$R_1(f_0) = \frac{qc^2}{f_0f_1} + a_0f_0, \quad R_1(f_1) = f_0.$$

(2.11)

Applying $R_1T_4^N$ on (2.11) and putting

$$f_{i,N}^k = R_1T_4^N(f_i) \quad (i = 0, 1, 2),$$

we have

$$f_{0,N}^{k+1} = \frac{q^{2N+1}c^2}{f_0^{k+1}} + a_0q^{k/2} + f_0^{k+1},$$

$$f_{1,N}^{k+1} = \frac{q^{2N+1}c^2}{f_1^{k+1}} + a_0q^{k/2} + f_1^{k+1},$$

$$f_{2,N}^{k+1} = f_2^{k+1},$$

$$f_{3,N}^{k+1} = f_3^{k+1},$$

$$f_{4,N}^{k+1} = f_4^{k+1}.$$
which is equivalent to $q$-$P_{II}$. Then $R_1$ and $T_4$ are regarded as the time evolution and a Bäcklund transformation of $q$-$P_{II}$, respectively.

In general, we can derive various discrete Painlevé systems from elements of infinite order of affine Weyl groups that are not necessarily translations by taking a projection on a certain subspace of the parameter space. We call such a procedure a projective reduction [12]. The symmetrization is a kind of the projective reduction.

### 2.3 Birational representation of $\tilde{W}((A_2 + A_1)^{(1)})$ on the $\tau$ function

We introduce the new variables $\tau_i$ and $\varpi_i$ ($i \in \mathbb{Z}/3\mathbb{Z}$) by letting

$$f_i = q^{1/3}c^{2/3} \frac{\varpi_i+1\tau_i-1}{\tau_i+1\varpi_i-1},$$

and lift a representation to the affine Weyl group on their level:

**Proposition 2.4 (33).** We define the action of $s_i$ ($i = 0, 1, 2$), $\pi$, $w_j$ ($j = 0, 1$), and $r$ on $\tau_k$ and $\varpi_k$ ($k = 0, 1, 2$) by the following formulae:

\[
s_i(\tau_i) = \frac{u_i\tau_{i+1}\varpi_{i+1} + \varpi_i + 1\tau_{i+1} - 1}{u_i\varpi_{i+1}}, \quad s_i(\varpi_i) = \frac{v_i\varpi_{i+1} + 1\tau_{i+1} - 1}{v_i\varpi_{i+1}}, \quad \pi(\tau_i) = \tau_{i+1}, \quad \pi(\varpi_i) = \varpi_{i+1},
\]

\[
w_0(\tau_i) = a_{i+1}^{1/3}(\tau_i\varpi_{i+1} + \tau_{i+1}\tau_i + 1 - 1\tau_{i+1}\varpi_{i+1} - 1), \quad w_0(\varpi_i) = \tau_i,
\]

\[
w_1(\tau_i) = a_{i+1}^{1/3}(\tau_i\varpi_{i+1} + \tau_{i+1}\tau_i + 1 - 1\tau_{i+1}\varpi_{i+1} - 1), \quad w_1(\varpi_i) = \tau_i,
\]

\[r(\tau_i) = \tau_i, \quad r(\varpi_i) = \varpi_i,
\]

with

$$u_i = q^{-1/3}c^{-2/3}a_i, \quad v_i = q^{1/3}c^{2/3}a_i,$$

where $i, j \in \mathbb{Z}/3\mathbb{Z}$. Then, $(s_0, s_1, s_2, \pi, w_0, w_1, r)$ forms the affine Weyl group $\tilde{W}((A_2 + A_1)^{(1)})$.

We define the $\tau$ function $\tau_{n,m}^{n,m} (n, m, N \in \mathbb{Z})$ by

$$\tau_{n,m}^{n,m} = T_1^nT_2^mT_4^N(\tau_1).$$

We note that

$$\tau_0 = \tau_{0,0}^{-1,0}, \quad \tau_1 = \tau_{0,0}^{0,1}, \quad \tau_2 = \tau_{0,0}^{0,1}, \quad \varpi_0 = \tau_1^{-1,0}, \quad \varpi_1 = \tau_1^{0,0}, \quad \varpi_2 = \tau_1^{0,1} \quad (2.12)$$

and

\[
f_{0,N}^{n,m} = q^{(2N+1)/3}c^{2/3} T_{n,m,n+1}^{n,m+1} T_{n,m,n+1}^{n,m+1}, \quad f_{1,N}^{n,m} = q^{(2N+1)/3}c^{2/3} T_{n,m,n+1}^{n,m+1} T_{n,m,n+1}^{n,m+1},
\]

\[
f_{2,N}^{n,m} = q^{(2N+1)/3}c^{2/3} T_{n,m,n,m}^{n,m} T_{n,m,n,m}^{n,m}, \quad f_{2,N}^{n,m} = q^{(2N+1)/3}c^{2/3} T_{n,m,n,m}^{n,m} T_{n,m,n,m}^{n,m}.
\]
Let us consider the τ functions for \( q \)-P\(_{II} \). We set
\[
\tau_N^k = R_1^k T_4^N(\tau_1).
\]

Note that
\[
\tau_0 = \tau_0^{-2}, \quad \tau_1 = \tau_0^0, \quad \tau_2 = \tau_0^{-1}, \quad \overline{\tau}_0 = \tau_1^{-2}, \quad \overline{\tau}_1 = \tau_1^0, \quad \overline{\tau}_2 = \tau_1^{-1},
\]
and
\[
f_{0,N}^k = q^{(2N+1)/3} c^{2/3} \frac{\tau_N^{k+1} \tau_N^{k-1}}{\tau_N^{k+1} \tau_N^{k-1}}.
\]

In general, it follows that
\[
\tau_{n,0}^N = \tau_{n,1}^N, \quad \tau_{n,1}^N = \tau_{n,2}^{2n-1}.
\]

For convenience, we introduce \( \alpha_i, \gamma, \) and \( Q \) by
\[
\alpha_i^6 = a_i, \quad \gamma^6 = c, \quad Q^6 = q.
\]

## 3 Hypergeometric τ functions of the \( q \)-Painlevé systems of type \((A_2 + A_1)^{(1)}\)

In this section, we construct the hypergeometric τ functions of \( q \)-P\(_{III} \) and \( q \)-P\(_{II} \). We define the hypergeometric τ functions of \( q \)-P\(_{III} \) by \( \tau_{n,m}^N \) consistent with the action of \( \langle T_1, T_2, T_3, T_4 \rangle \). We also define the hypergeometric τ functions of \( q \)-P\(_{II} \) by \( \tau_N^k \) consistent with the action of \( \langle R_1, T_4 \rangle \). Here, we mean \( \tau(\alpha) \) consistent with a action of transformation \( r \) as
\[
r.\tau(\alpha) = \tau(\alpha.r).
\]

We then regard \( \tau_{n,m}^N \) as function in \( \alpha_0 \) and \( \alpha_2 \), i.e.,
\[
\tau_{n,m}^N = \tau_{0,0}^N (Q^m \alpha_0, Q^{-m} \alpha_2).
\]

We also regard \( \tau_N^k \) as function in \( \alpha_0 \), i.e.,
\[
\tau_N^k = \tau_0^N (Q^{k/2} \alpha_0).
\]

### 3.1 Hypergeometric τ functions of \( q \)-P\(_{III} \)

We construct the hypergeometric τ functions of \( q \)-P\(_{III} \). By the action of the affine Weyl group, \( \tau_{n,m}^N \) is determined as a rational function in \( \tau_0^{n,m} \) and \( \tau_1^{n,m} \) (or \( \tau_1 \) and \( \overline{\tau}_1 \)). Thus, our purpose is determining \( \tau_0^{n,m} \) and \( \tau_1^{n,m} \) consistent with the action of \( \langle T_1, T_2, T_3, T_4 \rangle \) and constructing \( \tau_{n,m}^N \) under the condition
\[
\gamma = 1,
\]
and the boundary condition
\[
\tau_{n,m}^N = 0 \quad (N < 0).
\]

First we consider the condition for \( \tau_0^{n,m} \) which follows from the boundary condition \[12\]. We use the bilinear equations obtained in \[12\]:
Proposition 3.1. The following bilinear equations hold:

\[ \tau_{n+1}^{n,m} = Q^{n+1} \alpha_1 \alpha_2 \tau_n = 0 \]

(3.3)

\[ \tau_{n+1}^{n,m} + Q^{n+1} \alpha_0 \alpha_2 \tau_n = 0 \]

(3.4)

\[ \tau_{n+1}^{n,m} + Q^{n+1} \alpha_0 \alpha_2 \tau_n = 0 \]

(3.5)

Proof. By putting \( N = 0 \) in (3.3)–(3.5), we get

\[ Q^{n+1} \alpha_1 \alpha_2 \tau_n = 0 \]

(3.6)

\[ Q^{n+1} \alpha_0 \alpha_2 \tau_n = 0 \]

(3.7)

\[ Q^{n+1} \alpha_0 \alpha_2 \tau_n = 0 \]

(3.8)

We set

\[ \tau_0^{n,m} = \Gamma(Q^{n+1} \alpha_0 \alpha_2 Q, Q) \]

From (3.6)–(3.8), the following equations hold:

\[ (A_0^{n,m})^2 = A_0^{n+1,m+1} A_0^{n-1,m-1} \]

(3.9)

\[ (A_0^{n,m})^2 = A_0^{n+1,m+1} A_0^{n-1,m-1} \]

(3.10)

\[ (A_0^{n,m})^2 = A_0^{n+1,m+1} A_0^{n-1,m-1} \]

(3.11)

\[ (A_0^{n,m})^2 = A_0^{n+1,m+1} A_0^{n-1,m-1} \]

(3.12)

We next determine \( \tau_0^{n,m} \) and \( \tau_i^{n,m} \). From (2.8) and Proposition 2.4, we see that the action of \( T_1, T_2, \) and \( T_3 \) are given by

\[ T_1(\tau_{n-1}) = \tau_i, \]

(3.13)

\[ T_1(\tau_{n+1}) = \tau_i \]

(3.14)

\[ T_1(\tau_i) = \frac{1}{\alpha_i^{i+1}} \frac{\tau_i^2}{\tau_i} + \frac{\alpha_i^{i+1}}{\alpha_i} \tau_i \]

(3.15)

\[ T_1(\tau_i) = \frac{1}{\alpha_i^{i+1}} \frac{\tau_i^2}{\tau_i} + \frac{\alpha_i^{i+1}}{\alpha_i} \tau_i \]

(3.16)

\[ T_1(\tau_i) = \frac{1}{\alpha_i^{i+1}} \frac{\tau_i^2}{\tau_i} + \frac{\alpha_i^{i+1}}{\alpha_i} \tau_i \]

(3.17)

\[ T_1(\tau_i) = \frac{1}{\alpha_i^{i+1}} \frac{\tau_i^2}{\tau_i} + \frac{\alpha_i^{i+1}}{\alpha_i} \tau_i \]

(3.18)

where \( i = 1, 2, 3 \).

Lemma 3.1. If \( \tau_i \) and \( \tau_i \) are consistent with (3.13)–(3.16), then they are also consistent with (3.17) and (3.18).

Proof. Applying \( T_{n-1} \) on (3.16) and using (3.13) and (3.14), we have

\[ T_i(\tau_{n-1}) = Q^{n+1} \alpha_1 \alpha_2 \tau_{n-1} \]

(3.19)

By using (3.15) and (3.16) for (3.19), we get (3.17). Similarly, applying \( T_{n-1} \) on (3.15) and using (3.13) and (3.14), we have

\[ T_i(\tau_{n+1}) = Q^{n+1} \alpha_1 \alpha_2 \tau_{n+1} \]

(3.20)

By using (3.15) and (3.16) for (3.20), we get (3.18).
From (2.12), we rewrite (3.15) and (3.16) as follows:

\[
\begin{align*}
\tau_{0,0}^{-1,0} - Q^{-1} & \alpha_1 \tau_0^{-1,0} - 1,1,1,0 + Q^{-2} \alpha_1 \tau_0^{-1,1,0} = 0, \\
\tau_{0,1}^{-0,0} - Q^{-1} & \alpha_2 \tau_0^{-1,0} - 1,1,1,0 + Q^{-2} \alpha_2 \tau_0^{-1,1,0} = 0, \\
\tau_{0,1}^{-0,1} - Q^{-1} & \alpha_0 \tau_0^{-0,0} - 1,1,1,0 + Q^{-2} \alpha_0 \tau_0^{-0,1,1} = 0, \\
\tau_{0,1}^{-1,0} - Q & \alpha_2 \tau_0^{-0,0} - 1,1,1,0 - Q^2 \alpha_2 \tau_0^{-0,1,1} = 0, \\
\tau_{0,1}^{-1,1} - Q & \alpha_2 \tau_0^{-0,1,0} - 1,1,1,0 - Q^2 \alpha_2 \tau_0^{-0,1,0} = 0.
\end{align*}
\]

We set

\[
\tau_{1}^{n,m} = -Q^{2n+2m} \alpha_0^2 \alpha_2^2 - 2 \Theta(-Q^{-6n} \alpha_0^{-6}; Q^6) \Theta(-Q^{6m} \alpha_2^{-6}; Q^6) \tau_0^{n,m} F_{n,m-1}.
\]

Here, \( F_{n,m} \) is equivalent to (2.3) because we obtain (2.1) and (2.2) from (3.21)–(3.26) and (3.21)–(3.23), respectively. If we assume \( A_0^{n,m} \) is an arbitrary constant, it does not contradict (3.10)–(3.11). Therefore, we may set \( A_0^{n,m} = 1 \).

Finally we construct \( \tau_{n,m}^{n,m} \).

**Theorem 3.1.** Under the assumption (3.1) and (3.2), the hypergeometric \( \tau \) functions of \( q \)-Painlevé systems of Type \( (A_2 + A_1)^{(1)} \) are given as the follows:

\[
\tau_{n,m}^{n,m} = (-1)^{N(N+1)/2} Q^{-2(2n-m)N^2 + 6nN} \alpha_0^{-4N^2 + 6N \alpha_2^{-2N^2}} \times \left( \frac{\Theta(-Q^{-6n} \alpha_0^{-6}; Q^6) \Theta(-Q^{6m} \alpha_2^{-6}; Q^6)}{\Theta(-Q^{-6(n-m)} \alpha_0^{-6} \alpha_2^{-6}; Q^6)} \right)^N \times \Gamma(Q^{2n-m+1} \alpha_2^2; Q, Q) \Gamma(Q^{-n+2m-1} \alpha_1^2 \alpha_0; Q, Q)
\]

\[
\times \Gamma(Q^{-n-m} \alpha_2^2 \alpha_1; Q, Q) \psi_{n,m}^{n,m},
\]

where

\[
\psi_{n,m} = \begin{bmatrix}
F_{n,m} & F_{n+1,m} & \cdots & F_{n+N-1,m} \\
F_{n-1,m} & F_{n,m} & \cdots & F_{n+N-2,m} \\
\vdots & \vdots & \ddots & \vdots \\
F_{n-N+1,m} & F_{n-N+2,m} & \cdots & F_{n,m}
\end{bmatrix}, \quad \psi_{0,0}^{n,m} = 1, \quad \psi_{-N}^{n,m} = 0 \quad (N > 0),
\]

and

\[
F_{n,m} = \frac{A_{n,m}}{(a_2^{-2} q^{2m+2}; q^2)_\infty} \varphi_1 \left( \begin{array}{c}
0 \\
a_2^{-2} q^{-2m}; q^2 \\
a_2^{-2} a_0^{-2} q^{2n-2m+2}
\end{array} \right) + B_{n,m} \frac{\Theta(a_2^{-2} q^{2m-2}; q^2)_\infty}{(a_2^{-2} q^{2m-2}; q^2)_\infty} \Theta(a_2^{-2} q^{2m+2}; q^2) \varphi_1 \left( \begin{array}{c}
0 \\
a_2^{-2} q^{2m+4}; q^2 \\
a_2^{-2} a_0^{-2} q^{2n+2}
\end{array} \right).
\]

Here, \( A_{n,m} \) and \( B_{n,m} \) are periodic functions of period one with respect to \( n \) and \( m \).

**Proof.** We set

\[
\tau_{n,m}^{n,m} = (-1)^{N(N+1)/2} Q^{-2(2n-m)N^2 + 6nN} \alpha_0^{-4N^2 + 6N \alpha_2^{-2N^2}} \times \left( \frac{\Theta(-Q^{-6n} \alpha_0^{-6}; Q^6) \Theta(-Q^{6m} \alpha_2^{-6}; Q^6)}{\Theta(-Q^{-6(n-m)} \alpha_0^{-6} \alpha_2^{-6}; Q^6)} \right)^N \times \Gamma(Q^{2n-m+1} \alpha_2^2; Q, Q) \Gamma(Q^{-n+2m-1} \alpha_1^2 \alpha_0; Q, Q)
\]

\[
\times \Gamma(Q^{-n-m} \alpha_2^2 \alpha_1; Q, Q) \psi_{n,m}^{n,m},
\]
\[ \times \Gamma(Q^{2n-m+1} \alpha_0^2 \alpha_2; Q, Q) \Gamma(Q^{-n+2m-1} \alpha_1^2 \alpha_0; Q, Q) \Gamma(Q^{-n-m} \alpha_2^2 \alpha_1; Q, Q) \psi_{n,m}^{n,m-1}. \]

From (3.2), (3.9), and (3.27), we find
\[ \psi_{n,m}^{n,m} = 0 \quad (N < 0), \quad \psi_{0,m}^{n,m} = 1, \quad \psi_{1}^{n,m} = F_{n,m}. \]

Furthermore, it is easily verified that \( \psi_{n,m}^{n,m} \) satisfy
\[ \psi_{N+1}^{n,m} \psi_{N-1}^{n,m} - \left( \psi_{N}^{n,m} \right)^2 + \psi_{N+1}^{n,m} \psi_{N-1}^{n,m} = 0, \quad (3.30) \]
from (3.5). In general, (3.30) admits a solution expressed in terms of the Toeplitz type determinant
\[ \psi_{n,m}^{n,m} = \text{det} \left( c_{n-i+j,m} \right)_{i,j=1,...,N} \quad (N > 0), \]
under the boundary conditions
\[ \psi_{n,m}^{n,m} = 0 \quad (N < 0), \quad \psi_{0,m}^{n,m} = 1, \quad \psi_{1}^{n,m} = c_{n,m}, \]
where \( c_{n,m} \) is an arbitrary function. Therefore we have completed the proof. \[ \blacksquare \]

3.2 Hypergeometric \( \tau \) functions of \( q \)-P\( \Pi \)

In this section, we construct the hypergeometric \( \tau \) functions of \( q \)-P\( \Pi \) by two methods.

3.2.1 Hypergeometric \( \tau \) functions of \( q \)-P\( \Pi \) (I)

We construct the hypergeometric \( \tau \) functions of \( q \)-P\( \Pi \) by using those of \( q \)-P\( \Pi \). We here note that \( \tau_{n,m}^{n,m} \) consistent with the action of \( \langle s_2, T_1, T_2, T_3, T_4 \rangle \) is also consistent with the action of \( R_1 \) because
\[ R_1 = s_2 T_2^{-1}. \]

Therefore, we construct \( \tau_{n,m}^{n,m} \) consistent with the action of \( \langle s_2, T_1, T_2, T_3, T_4 \rangle \). The action of \( s_2 \) on \( \tau_{n,m}^{n,m} \) is
\[ s_2(\tau_{n,m}^{n,m}) = \tau_{n-m,-m}^{n,m}. \quad (3.31) \]

We consider only \( \tau_{0,m}^{n,m} \) and \( \tau_{1}^{n,m} \) because \( \tau_{n,m}^{n,m} \) is determined as a rational function in \( \tau_{0,m}^{n,m} \) and \( \tau_{1}^{n,m} \). It easily verified that \( \tau_{0,m}^{n,m} \), (3.28) (or (3.9)), is consistent with the action of \( s_2 \). When \( N = 1 \), we rewrite (3.31) as
\[ s_2(F_{n,m-1}) = \alpha_2^{-12} Q^{-12 m} \Theta(\alpha_0^{-12} Q^{12 m-12 n}; Q^{12}) \Theta(\alpha_0^{-12} Q^{-12} Q^{-12 n-12 n+12}; Q^{12}) F_{n-m,-m-1}, \quad (3.32) \]
from (3.28). Moreover, by using (3.29), (3.32) can be rewritten as
\[ s_2(A_{n,m}) - B_{n,m} = \frac{\Theta(\alpha_0^{-12} Q^{12 n-12 m}; Q^{12})}{(\alpha_2^{-12} Q^{-12 m}; Q^{12})_{\infty}} 1 \psi_1^{0} \left( \frac{0}{\alpha_2^{-12} Q^{-12 m+12}; Q^{12}, \alpha_0^{-12} Q^{12 n-12 m+12}} \right) \]
\[ = \frac{(A_{n,m} - s_2(B_{n,m})) \Theta(\alpha_0^{-12} Q^{12 n-12 m}; Q^{12})}{(\alpha_2^{-12} Q^{-12 m}; Q^{12})_{\infty} \Theta(\alpha_0^{-12} \alpha_2^{-12} Q^{12 n}, Q^{12})} 1 \psi_1^{0} \left( \frac{0}{\alpha_2^{-12} Q^{12 m+12}; Q^{12}, \alpha_0^{-12} \alpha_2^{-12} Q^{12 n+12}} \right), \]
which implies that \( \tau_{1}^{n,m} \) is also consistent with the action of \( s_2 \) when
\[ s_2(A_{n,m}) = B_{n,m}. \quad (3.33) \]
Lemma 3.2. Under the assumption (3.33), the hypergeometric $\tau$ functions (3.28) are consistent with the action of $(s_2, T_1, T_2, T_3, T_4)$.

Therefore we easily obtain the following theorem:

Theorem 3.2. Setting

\[ R_1(A_{n,m}) = B_{n,m}, \quad \alpha_2 = Q^{1/2}, \]  

and putting

\[ \tau_{N}^{2n} = \tau_{N}^{n,0}, \quad \tau_{N}^{2n-1} = \tau_{N}^{n,1}, \]

we obtain the hypergeometric $\tau$ functions of $q$-P$_{II}$. Here $\tau_{N}^{n,m}$ is given by (3.28).

In general, the entries of determinants of the hypergeometric $\tau$ functions of Painlevé systems are expressed by two-parameter family of the functions satisfying the contiguity relations. However the hypergeometric $\tau$ functions of $q$-P$_{II}$ in Theorem 3.2 have only one parameter because of the condition (3.34). In the next section, we construct the hypergeometric $\tau$ functions of $q$-P$_{II}$ which admits two parameters.

3.2.2 Hypergeometric $\tau$ functions of $q$-P$_{II}$ (II)

We construct the hypergeometric $\tau$ functions of $q$-P$_{II}$ whose ratios correspond to the hypergeometric solutions of $q$-P$_{II}$ in Proposition 2.2. By the action of the affine Weyl group, $\tau_{N}^{k}$ is determined as a rational function of $\tau_{0}^{k}$ and $\tau_{1}^{k}$ (or $\tau_{i}$ and $\tau_{i}$). Thus, our purpose is determining $\tau_{0}^{k}$ and $\tau_{1}^{k}$ consistent with the action of $\langle R_{1}, T_{4} \rangle$ and constructing $\tau_{N}^{k}$ under the conditions

\[ \alpha_2 = Q^{1/2}, \quad \gamma = 1, \]  

and the boundary condition

\[ \tau_{N}^{k} = 0 \quad (N < 0). \]  

First we consider the condition for $\tau_{0}^{k}$ which follows from the boundary condition (3.36). We use the bilinear equation obtained in [12]:

Proposition 3.2. The following bilinear equation holds:

\[ \tau_{N+1}^{k} \tau_{N-1}^{k+1} - Q^{(k-4N+1)/2} \gamma^{-2} \alpha_{0}^{k+2} \tau_{N}^{k} \tau_{N}^{k-1} - Q^{-k+4N-1} \gamma^{4} \alpha_{0}^{-2} \tau_{N}^{k+1} \tau_{N}^{k} = 0. \]  

By putting $N = 0$ in (3.37), we get

\[ Q^{(k+1)/2} \alpha_{0}^{3} \tau_{0}^{k+2} \tau_{0}^{k-1} + \tau_{0}^{k+1} \tau_{0}^{k} = 0. \]  

We set

\[ \tau_{0}^{k} = \Gamma(Q^{(2k+3)/2} \alpha_{0}^{2}; Q, Q) \Gamma(Q^{-k/2} \alpha_{0}^{-1}; Q, Q) \Gamma(Q^{(-k+3)/2} \alpha_{0}^{-1}; Q, Q) A_{1}^{k}. \]  

From (3.38), $A_{1}^{k}$ satisfies

\[ A_{1}^{k+2} A_{1}^{k-1} = A_{1}^{k+1} A_{1}^{k}. \]  

\[ (3.40) \]
We next determine \( \tau_k^0 \) and \( \tau_k^1 \). From (2.10) and Proposition 2.4, we see that the action of \( R_1 \) on \( \tau_k^0 \) and \( \tau_k^1 \) is given by

\[
\begin{align*}
R_1(\tau_0) &= \tau_2, \quad \text{(3.41)} \\
R_1(\tau_1) &= \frac{Q^{-2} \alpha_0^6 \tau_1 \tau_2 + \tau_1 \tau_2}{Q^{-1} \alpha_0^3 \tau_0}, \quad \text{(3.42)} \\
R_1(\tau_2) &= \tau_1, \quad \text{(3.43)} \\
R_1(\tau_0) &= \tau_2, \quad \text{(3.44)} \\
R_1(\tau_1) &= \frac{Q^2 \alpha_0^6 \tau_1 \tau_2 + \tau_1 \tau_2}{Q \alpha_0^3 \tau_0}, \quad \text{(3.45)} \\
R_1(\tau_2) &= \tau_1. \quad \text{(3.46)}
\end{align*}
\]

From (2.13), we rewrite (3.42) and (3.45) as

\[
\begin{align*}
Q \alpha_0^{-2} \tau_1^{-1} \tau_0 - Q^2 \alpha_0^{-6} \tau_1 \tau_0^{-1} - \tau_0 \tau_1^{-1} &= 0, \quad \text{(3.47)} \\
Q^{-1} \alpha_0^{-3} \tau_0^{-1} \tau_1 - Q^{-2} \alpha_0^{-6} \tau_0 \tau_1^{-1} - \tau_0 \tau_1^{-1} &= 0, \quad \text{(3.48)}
\end{align*}
\]

respectively. Setting

\[
\tau_k^1 = \frac{\tau_k^0}{\Theta(Q^{3k+1} \alpha_0^0; Q^3)} G_k, \quad \text{(3.49)}
\]

then the systems (3.47) and (3.48) reduce to (2.6). Therefore, \( G_k \) is equivalent to (2.7). If we assume \( A_1^k \) is an arbitrary constant, it does not contradict (3.40)–(3.46). Therefore, we may put \( A_1^k = 1 \).

Finally we present an explicit formula for \( \tau_k^N \).

**Theorem 3.3.** Under the assumption (3.35) and (3.36), the hypergeometric \( \tau \) functions of \( q \)-P\( \text{II} \) are given as the follows:

\[
\tau_k^N = (-1)^{N(N-1)/2} Q^{N(N-1)(k+N)} \alpha_0^{2N(N-1)} \Gamma(Q^{(2k+3)/2} \alpha_0^2; Q, Q) \Gamma(Q^{-k/2} \alpha_0^{-1}; Q, Q) \frac{\Theta(Q^{3k+1} \alpha_0^0; Q^3)^N}{\Theta(Q^{3k+1} \alpha_0^0; Q^3)^N} \phi_k^N,
\]

where

\[
\phi_k^N = \left| \begin{array}{cccc}
G_k & G_{k-1} & \cdots & G_{k-N+1} \\
G_{k+2} & G_{k+1} & \cdots & G_{k-N+3} \\
\vdots & \vdots & \ddots & \vdots \\
G_{k+2N-2} & G_{k+2N-3} & \cdots & G_{k+N-1}
\end{array} \right|, \quad \phi_0^k = 1, \quad \phi_{-N}^k = 0 \quad (N > 0),
\]

and

\[
G_k = A_k \Theta(i \alpha_0 q^{2k+1}/4; q^{1/2}) \, \phi_1 \left( \begin{array}{c} 0 \\
-1/2; q^{1/2}, -i \alpha_0 q^{(3+2k)/4}
\end{array} \right) \\
+ B_k \Theta(-i \alpha_0 q^{(2k+1)/4}; q^{1/2}) \, \phi_1 \left( \begin{array}{c} 0 \\
-1/2; q^{1/2}, i \alpha_0 q^{(3+2k)/4}
\end{array} \right).
\]

Here, \( A_k \) and \( B_k \) are periodic functions of period one.
\textbf{Proof.} We set
\[
\tau^k_N = (-1)^{N(N-1)/2}Q^{N(N-1)(k+N)}a_0 2^{N(N-1)} \\
\times \frac{\Gamma(Q^{2k+3)/2}a_0^2; Q, Q) \Gamma(Q^{-k/2}a_0^{-1}; Q, Q) \Gamma(Q^{-(k+3)/2}a_0^{-1}; Q, Q)}{\Theta(Q^{3k+1}a_0^{2}; Q^3)^N} \phi^k_N.
\]
From (3.36), (3.39), and (3.49), we find that
\[
\phi^k_N = 0 \quad (N < 0), \quad \phi^0_1 = 1, \quad \phi^k_1 = G_k.
\]
From (3.37), \( \phi^k_N \) satisfies
\[
\phi^k_{N+1} \phi^k_{N-1} + \phi^k_N \phi^k_{N+1} = 0,
\]
which is a variant of the discrete Toda equation. Under the conditions
\[
\phi^k_N = 0 \quad (N < 0), \quad \phi^0_0 = 1, \quad \phi^k_0 = c_k,
\]
where \( c_k \) is an arbitrary function. Equation (3.50) admits a solution expressed by
\[
\phi^k_N = \det (c_{k+2i-j-1})_{i,j=1,...,N} \quad (N > 0).
\]
This complete the proof. \[\blacksquare\]

\section{3.3 Relation between the hypergeometric \( \tau \) functions of \( q \)-P\( _{III} \) and Heine’s transform}

Masuda showed that the consistency of a certain reflection transformation to the hypergeometric \( \tau \) functions of type \( E_8^{(1)} \) correspond to Bailey’s four term transformation formula. It is also shown that the consistency of a certain reflection transformation to the hypergeometric \( \tau \) functions of type \( E_7^{(1)} \) correspond to limiting case of Bailey’s \( \varphi_9 \) transformation formula. We here show that the consistency of \( s_0 \) to the hypergeometric \( \tau \) functions of \( q \)-P\( _{III} \) give rise to a transformation of \( \varphi_1 \) which is obtained by Heine’s transform for \( \varphi_1 \).

The action of \( s_0 \) on \( \tau^{n,m}_N \) is
\[
s_0(\tau^{n,m}_N) = \tau^{-n,m-n}_N.
\]
We consider only \( \tau^{n,m}_0 \) and \( \tau^{n,m}_1 \) because \( \tau^{n,m}_N \) is determined as a rational function in \( \tau^{n,m}_0 \) and \( \tau^{n,m}_1 \). It easily verified that \( \tau^{n,m}_0, \quad \text{(3.28)} \) (or (3.39)), is consistent with the action of \( s_0 \). When \( N = 1, \quad \text{(3.51)} \) implies
\[
s_0(F_{n,m-1}) = \frac{\Theta(a_2^{-12}Q^{-12n+12m}; Q^{12})}{\Theta(a_0^{-12}a_2^{-12}Q^{12}; Q^{12})} F_{-n,m-n-1},
\]
from (3.28). Moreover, by using (3.29), (3.52) can be rewritten as
\[
s_0(A_{n,m}) \varphi_1 \left( \begin{array}{cc} 0 & a_0^{-12}a_2^{-12}Q^{-12m+12} \\ a_0^{-12}a_2^{-12}Q^{-12m+12} & a_2^{-12}Q^{12n-12m+12} \end{array} \right) \\
- A_{n,m} \left( \begin{array}{cc} a_0^{-12}a_2^{-12}Q^{12n-12m+12} & a_2^{-12}Q^{12n-12m+12} \\ a_0^{-12}a_2^{-12}Q^{-12m+12} & a_2^{-12}Q^{12n-12m+12} \end{array} \right)_\infty \varphi_1 \left( \begin{array}{cc} 0 & a_2^{-12}Q^{12n-12m+12} \\ a_2^{-12}Q^{12n-12m+12} & a_2^{-12}Q^{12n-12m+12} \end{array} \right)_\infty \\
- B_{n,m}a_0^{-12}Q^{-12n} \left( a_0^{-12}a_2^{-12}Q^{12n} \right) \left( a_2^{-12}Q^{12n} \right)_\infty
\]
\[ \times {}_{1}\phi_{1}\left(\frac{0}{\alpha_0^{12}\alpha_2^{12}Q^{12n-12m+12}; Q^{12}}, \alpha_0^{12}\alpha_2^{12}Q^{12n-12m+12}\right) \]

\[ + s_0(B_{n,m}) \frac{(\alpha_0^{12}\alpha_2^{12}Q^{12m}; Q^{12})_\infty \Theta(\alpha_2^{12}Q^{12n-12m}; Q^{12})}{(\alpha_0^{12}\alpha_2^{12}Q^{12m}; Q^{12})_\infty \Theta(\alpha_0^{12}\alpha_2^{12}Q^{12n}; Q^{12})} \times {}_{1}\phi_{1}\left(\frac{0}{\alpha_0^{12}\alpha_2^{12}Q^{12m+12}; Q^{12}}, \alpha_0^{12}\alpha_2^{12}Q^{12m+12}\right) = 0. \] (3.53)

In particular, setting

\[ s_0(A_{n,m}) = A_{n,m}, \quad B_{n,m} = 0, \]

in (3.53), we obtain

\[ {}_{1}\phi_{1}\left(\frac{0}{\alpha_0^{12}\alpha_2^{12}Q^{12n-12m+12}; Q^{12}}, \alpha_2^{12}Q^{12n-12m+12}\right) = \frac{(\alpha_2^{12}Q^{12n-12m+12}; Q^{12})_\infty}{(\alpha_0^{12}\alpha_2^{12}Q^{12m+12}; Q^{12})_\infty} {}_{1}\phi_{1}\left(\frac{0}{\alpha_0^{12}\alpha_2^{12}Q^{12m+12}; Q^{12}}, \alpha_0^{12}\alpha_2^{12}Q^{12m+12}\right). \] (3.54)

Equation (3.54) corresponds to a specialization of Heine’s transform. Actually, by putting

\[ a = b^{-1}c, \quad d = b^{-1}z, \]

in Heine’s transform \([33]\),

\[ {}_{2}\phi_{1}\left(\frac{a, b}{c, d}; q, d\right) = \frac{(a, bd; q)_\infty}{(c, d; q)_\infty} {}_{2}\phi_{1}\left(\frac{a^{-1}c, d}{bd}; q, a\right), \]

we obtain

\[ {}_{2}\phi_{1}\left(\frac{b^{-1}c, b}{c, b^{-1}z}; q, b^{-1}z\right) = \frac{(b^{-1}c, z; q)_\infty}{(c, b^{-1}z; q)_\infty} {}_{2}\phi_{1}\left(\frac{b, b^{-1}z}{z}; q, b^{-1}c\right). \] (3.55)

Taking the limit \( b \to \infty \) in (3.55) leads to

\[ {}_{1}\phi_{1}\left(\frac{0}{c, z}; q, z\right) = \frac{(z; q)_\infty}{(c; q)_\infty} {}_{1}\phi_{1}\left(\frac{0}{z}; q, c\right), \]

which is equivalent to (3.54).

Acknowledgements

The author would like to express sincere thanks to Professor T. Masuda for fruitful discussions and valuable suggestions. I acknowledge continuous encouragement by Professors K. Kajiwara and T. Tsuda. This work has been partially supported by the JSPS Research Fellowship.
