Abstract

The genus Acrocyrtus is reported from Chinese mainland for the first time, with description of two new species Acrocyrtus zhuiiensis sp. n. and Acrocyrtus finis sp. n. from Zhejiang Province, East China. They can be separated from other species of this genus by colour pattern, unscaled appendages (antennae, legs and ventral tube), interocular chaetae, labial basal chaetae, bothriotrichal complex chaetae on Abd. II–IV, microchaeta a2 on Abd. II, im on Abd. III and C1p on Abd. IV. Illustrations and a table showing main differences with closest Acrocyrtus species are provided.

Keywords

A. zhuiiensis sp. n., A. finis sp. n., chaetotaxy, China
Introduction

Acrocyrtus was established by Yosii 1959 as a subgenus of Lepidocyrtus Bourlet, 1839 for Lepidocyrtus (Acrocyrtus) malayanus Yosii, 1959 having pointed dental tubercle. Yoshii and Suhardjono (1989) raised it to generic level and established three sub-genera (Acrocyrtus, Onerocyrtus, Carocyrtus) based on scales distribution of ventral tube. Christiansen and Bellinger (1991) analyzed the phylogenetic relationships among Hawaiian Lepidocyrtus s. l. species and questioned the reliability of dental tubercle. Later, Soto-Adames (2000) made a phylogenetic analysis of Neotropical members of the genus, disagreeing with the previous conclusion and considering that this character has phylogenetic information useful in defining Yosii’s subgenera; he also suggested that dental tubercle should be used in combination with other characters. Considering the availability of this character in most literature descriptions and how easily it can be observed in practice, we considered that its use at generic level is relevant.

Acrocyrtus is characterized by the presence of conical pointed dental tubercles, rounded and finely striated scales on body and ventral side of furcula, 8+8 ommatidia (G and H smaller), 4-segmented antennae and apical bulb absent on Ant. IV, bidentate mucro with or without accessory spinelet. It is widely distributed in Southeast Asia, such as Singapore, Malay and Indonesia. So far, more than 26 species of the genus Acrocyrtus were described all over the world (Pan et al. 2011). Only one species Acrocyrtus heterolepis Yosii, 1959 was recorded from Hong Kong (Yosii 1966) and Taiwan (Yosii 1982), China. Recently, an unidentified species assigned to “cf. Acrocyrtus” was also recorded from a cave in Huanjiang (Guangxi) by Deharveng et al. (2008). The two new species of Acrocyrtus that are studied here represent the first ones described from mainland of China.

Materials and methods

The specimens were cleared in lactic acid, mounted under a coverslip in Marc André II solution, observed using Leica DM2500 and Nikon 80i microscopes. The photographs were taken with Nikon SM1000 microscope using a mounted Nikon DS-Fi1 camera and enhanced with Photoshop CS2. Length data were measured with NIS-Elements Documentation (Nikon). Dorsal cephalic chaetae were designated after Gisin’s system (1967), interocular chaetae after Mari-Mutt (1979, 1986), labial palp chaetae after Fjellberg (1998), labial chaetae after Gisin (1964), dorsal body chaetae after Szeptycki (1979).

Abbreviations. Th. -thoracic segment; Abd. -abdominal segment; Ant. -antennal segment; ms -specialized S-microchaeta(e); S-chaeta(e) -specialized chaeta(e) (including ms); mac -macrochaeta(e); mic -microchaeta(e).
**Taxonomy**

*Acrocyrtus zhujiensis* sp. n.

urn:lsid:zoobank.org:act:D8F04C9C-6364-44CF-AA8E-B5B86580D831
http://species-id.net/wiki/Acrocyrtus_zhujiensis

Figs 1–27, Table 1

**Holotype.** ♀ on slide, Shaoxin City, Zhuji Country, Dongbaihu, Zhejiang Province, CHINA, 29°34.18’N, 120°24.06’E, 3.X.2009, collection number S4014, collected by Zhi-Xiang Pan & Chen-Chong Si, deposited in Taizhou University.

**Paratypes.** 6 ♀ and 1 ♂ on slide and 10 in alcohol, same data as holotype. 4 paratypes (2 ♀ on slide and 2 in alcohol) deposited in School of Life Sciences, Nanjing University and others in School of Life Sciences, Taizhou University, China.

**Etymology.** Named after the type locality.

**Description.** Body length up to 0.93 mm.

Colour pattern. Ground colour pale yellow, with a pair of dark patches present on lateral Abd. III. Violet pigment distributed on antennae and gradually darker towards tip. Eye patches dark (Fig. 1). Scales hyaline, oval to circular (Fig. 2), present on head, body tergites, ventral side of furcula; antennae, ventral tube and legs unscaled.

Head. Ommatidia 8+8, G and H smaller than others. Interocular chaetae as p, r, t, q, s, v; chaeta s smooth, chaetae r and v transformed to scales, chaetae p, t and q ciliate (Fig. 5). Antennae 1.5–2.4 times as long as cephalic diagonal. Antennal segmental ratio as I:II:III:IV = 1:1.3–1.4:1.2–1.9:1.9–3.1. Ant. I with 3 dorsal and 3 ventral basal spiny mic (Fig. 6). Ant. II with 4 basal tiny spiny mic, 1 distal rod-like

### Table 1. Main differences between three similar species of *Acrocyrtus.*

| Feature                              | *A. zhujiensis* | *A. finis* | *A. baii* |

?: character not provided in original description
and 12–15 normal S-chaetae (Fig. 7). Ant. III organ with 2 rod-like S-chaetae (Fig. 8). Ant. IV without apical bulb. Anterior part of head with many long, ciliate chaetae but not claviform (Fig. 5). Prelabral and labral chaetae as 4/5, 5, 4, prelabrals ciliate and others smooth, labral intrusion V-shaped, chaetae of c-row thicker than those in other rows; labral margin with 4 conical papillae (Fig. 3). Clypeal chaetae as 3-1-4, without scales between them (Fig. 9). Cervical chaetae as 16 spiny chaetae, lateral two slightly longer than others (Fig. 10). Subapical chaeta of maxillary outer lobe subequal to apical one, 3 smooth sublobal hairs on sublobal plate. Labial palp with 5 papillae

as A–E, respectively with 0, 5, 0, 4, 4 guard chaetae; lateral process (l.p.) of labial palp straight, thick and blunt with tip not reaching apex of papilla E. Chaetotaxy of labial base as $M_1M_2REL_1L_2$, all ciliate, chaeta R shorter than others (Fig. 11). Chaetal row along labial groove with 3 ciliate chaetae, and other postlabial chaetae ciliate (Fig. 12). Mandible with 4+5 (left+right) teeth (Fig. 3).

Leg. Coxae: I, with 7 ciliate mac and 2 pseudopores; II, with 7–8 ciliate mac in the anterior row, 8–11 ciliate mac in the posterior row and 3 pseudopores; III, with 9–11 ciliate mac and 2 pseudopores (Fig. 13). Trochanteral organ with 12–17 smooth spines (1–2 inner) (Fig. 14). Unguis with 4 inner teeth (paired ones at 1/3, middle one at 2/3 and apical one at 3/4 distance from base), 2 lateral teeth (at 1/4 distance from base) and 1 outer tooth (at 1/5 distance from base). Unguiculus slender and truncate with outer edge serrate. Tenent hair clavate, subequal to inner edge of unguis in length, and slightly longer than unguiculus. A distal smooth chaeta on tibiotarsus III subequal to unguiculus in length (Fig. 15).

Ventral tube. Anterior face with 14+14 ciliate chaetae; posterior face without smooth chaeta (Fig. 16); lateral flap with 6–8 smooth and 2–4 ciliate chaetae (Fig. 17).
Figures 26–27. Dorsal chaetotaxy of *A. zhujiensis* sp. n. 26 Abd. IV 27 Abd. V (ps: postero-sublateral S-chaeta).

Furcula. Manubrial plaque with 2–3 inner, 4–6 outer ciliate chaetae and 2 pseudo-pores. Dental tubercles conically pointed (Figs 4, 18). Ventral terminal manubrium with 2+2 ciliate chaetae (Fig. 19). Distal smooth part of dentes 2.1–2.5 times as long as mucro. Mucro bidentate, mucronal basal spine reaching subapical tooth with an accessory spinelet (Fig. 20).
Chaetotaxy. Dorsal cephalic mac as $R_0 \cdot R_1 \cdot R_2 \cdot STP_0$; $R_3$ absent. Body mac as 00/0100+3, S-chaetae as 21/11253, ms as 10/10100. Th. II slightly protruded over head, with 1–2 rows of ciliate “collar” mac, 2 antero-lateral S-chaetae (ms external to another S-chaeta), 6 ($p_1$–$p_6$) smooth mic and 5 anterior unclear homology smooth mic (Fig. 21). Th. III with 1 S-chaeta external to $m_7$; 15 ($a_1$–$a_6$, $m_2$, $m_4$–$m_6$ and $p_1$–$p_6$) smooth mic and 3 ($a_7$, $m_7$ and $m_7e$) ciliate mac and a lateral unclear homology ciliate chaeta (Fig. 22). Abd. I with 1 ms, 12 ($a_1$–$a_3$, $a_5$–$a_6$, $m_2$–$m_3$, $m_4$–$m_6$, $p_4$–$p_7$, $p_5p$ and $el$) smooth mic, 1 ciliate and slightly modified mic (mi), 2 ($Lm$ and $Li$) ciliate, modified and fan-shaped mic, 2 ($m_3$ and $m_5$) ciliate mac; chaetae $a_2p$ and $ml$ absent (Fig. 24). Abd. III with 1 central S-chaeta (as) and 1 lateral ms, 5 ($mi$, $ml$, $a_2$, $im$, $em$ and $am_6$; $ml$ sometimes present on one side) ciliate and slightly modified mic, 4 ($Li$, $Lm$, $Li$ and $a_6$) strongly modified and fan-shaped mic, 8 ($a_3$, $a_7$, $m_3$, $m_7$, $p_3$–$p_5$ and $p_7$) smooth and subequal mic, 3 ($pm_6$, $m_7a$ and $p_6$) ciliate mac (Fig. 25). Abd. IV with 1 anterior (as) and 1 posterior (ps) short S-chaetae and 3 median elongate S-chaetae, 22 ($A_2$–$A_6$, $B_2$–$B_3$, $Be_2$, $C_1$–$C_4$, $T_1$, $T_3$, $T_5$–$T_6$, $Te_3$, $D_2$–$D_3$, $D_1p$, $E_1$ and $Fe_1$) smooth mic, 2 ($C_{1p}$ and $T_7$) ciliate mic, 6 ($m$, $a$, $s$, $D_1$, $pi$ and $pe$) ciliate, strongly modified and fan-shaped mic, 13 ($B_4$–$B_6$, $De_1$, $De_3$, $D_3p$, $E_2$–$E_4$, $F_2$–$F_3$, $F_3p_2$, $Fe_4$ and $Fe_6$) ciliate mac, 4 ($E_4p$, $E_4p_2$, $F_2p$ and $F_3p_2$) mic (Fig. 26). Abd. V with 3 S-chaetae (Fig. 27).

Ecology. In the leaf litter of Cunninghamia lanceolata, Cinamomum camphora along a lake.

Remarks. This new species is characterized by colour pattern, clavate tenent hair, unscaled appendages (antennae, legs and ventral tube), 4 conical labral papillae, ventral tube with ciliate chaetae present on lateral flap and without smooth chaeta on posterior side, and ciliate mic $a_2$ on Abd. II.

It is similar to Vietnamese Acrocyrtus baii Nguyen, 2005 in clavate tenent hair, claw, unscaled appendages (antennae and ventral tube). However, it can be easily distinguished from it by pigment absent on Th. II–III and Abd. II (versus present), ciliate labial chaetae $EL_1L_2$ (versus smooth), $M_1$ subequal to $M_2$ on labial base (versus $M_1$ smaller than $M_2$), absence of smooth chaetae on posterior face of ventral tube (versus 1+1 smooth chaetae) and unscaled legs (versus scaled).

Acrocyrtus finis sp. n. urn:lsid:zoobank.org:act:0E689089-71E5-4FD4-AD50-3A2B23CE5595 http://species-id.net/wiki/Acrocyrtus_finis Figs 28–37, Table 1

Holotype. 1 ♀ on slide, Taizhou City, Dalei Mountain, Zhejiang Province, CHINA, 29°02.25’N, 120°53.03’E, 25.X.2009, collection number S4023, collected by Zhi-Xiang Pan, deposited in Taizhou University.
Figures 28–30. *A. finis* sp. n. 28 colour pattern, lateral view 29 body scale 30 labium and labrum (30A labral intrusion 30B labial papillae D, E and l.p. 30C labial base).

**Paratypes.** 11 ♀ on slide and 15 in alcohol, same data as holotype. 4 paratypes (2 ♀ on slide and 2 in alcohol) deposited in School of Life Sciences, Nanjing University and others in School of Life Sciences, Taizhou University, China.

**Etymology.** Named after the type locality, which is the border (latin word “finis”) of the three adjacent cities.

**Description.** Body length up to 1.2 mm.

Colour pattern. Ground colour from yellow to slightly brown, a pair of dark lateral patches of Abd. III and a pair of dark postero-lateral patches of Abd. IV, slightly violet pigment distributed on antennae and gradually darker towards tip, eye patches dark (Fig. 28). Scales hyaline, oval to circular (Fig. 29), present on head, body tergites and ventral side of furcula, and absent on antennae, legs and ventral tube.

Head. Ommatidia 8+8, G and H smaller than others, interocular chaetae as p, r, t, q, s, v; chaeta s smooth, chaetae p, t, q ciliate, chaetae r and v transformed to scales. Antennae 1.4–2.0 times as long as cephalic diagonal. Antennal segmental ratio as I:II:III:IV = 1:1.3–1.9:1.5–2.5:2.5–5.0. Ant. I with 3 dorsal and 3 ventral basal
First record of Acrocyrtus Yosii, 1959 (Collemobla, Entomobryidae) from Chinese mainland

Figures 31–33. Dorsal chaetotaxy of *A. finis* sp. n. 31 Th. II 32 Th. III 33 Abd. I.

spiny chaetae. Ant. II with 4 basal tiny spines, 11–14 short and 1 distal rod-like S-chaetae. Ant. III organ with 2 rod-like S-chaetae. Ant. IV without apical bulb. Anterior part of head with many ciliate and long, but not claviform chaetae. Cervical with 16
spiny chaetae, all subequal in length. Prelabral and labral chaetae as 4/5, 5, 4, prelabrals ciliate and others smooth, chaetae of c-row thicker than other row chaetae; labral intrusion V-shape; labral margin with 4 papillae. Clypeus without scales. Subapical chaeta of the maxillary outer lobe subequal to apical chaeta, 3 smooth sublobal hairs on sublobular plate. Labial palp with five papillae as A–E, respectively with 0, 5, 0, 4, 4 guard chaetae; lateral process of labial palp straight, thick with tip not reaching apex of papilla E. Chaetotaxy of labial base as M,M,REL,, all ciliate, chaeta shorter than others. Chaetal row along labial groove with 3 ciliate chaetae, and other postlabial chaetae ciliate. Mandible with 4+5 (left+right) teeth (Fig. 30).

Leg. Coxae: I, with 5–7 ciliate mac and 2 pseudopores; II, with 6–7 ciliate mac in the anterior row, 7–9 ciliate mac in the posterior row and 3 pseudopores; III, with 6–7+3 ciliate mac and 2 pseudopores. Trochanteral organ with 10–14 smooth spiny chaetae. Unguis with 1 outer (at 1/5 distance from base), 2 lateral (at 1/4 distance from
First record of Acrocyrtus Yosii, 1959 (Collemobla, Entomobryidae) from Chinese mainland

Figures 36–37. Dorsal chaetotaxy of *A. finis* sp. n. 36 Abd. IV 37 Abd. V.
base) and 4 inner teeth (paired ones at 1/3, middle one at 2/3 and apical one at 3/4 distance from base to apical inner unguis), all tiny. Unguiculus slender and truncate with outer edge slightly serrate. Tenent hair clavate, subequal to inner margin of unguis, and slightly longer than unguiculus. Supraempodial chaeta subequal to unguiculus.

Ventral tube. Anterior face with 9–15 larger ciliate chaetae; posterior face without smooth chaetae; lateral flap with 6–7 smooth and 2–3 ciliate chaetae.

Furcula. Manubrial plaque with 2–3 inner, 4–6 outer ciliate chaetae and 2 pseudopores, ventral manubrium with 2+2 ciliate terminal chaetae. Dental tubercles conically pointed. Distal smooth part of dentes 1.5–2.0 times as long as mucro. Mucro bidentate, mucronal basal spine reaching subapical tooth with two accessory spinelets.

Chaetotaxy. Dorsal cephalic mac as $R_0R_1R_2TS$, $P_0$ sometimes absent. Body mac as 00/0100+3, S-chaetae as 21/11253, ms as 10/10100. Th. II slightly protruded over head, with 2 antero-lateral S-chaetae (ms postero-external to another one), 6 (p1–6) smooth and subequal mic and 5 anterior smooth mic of unclear homology (Fig. 31). Th. III with 1 S-chaeta external to m7, 15 (a1–4, a6, m2, m4–6 and p1–6) smooth mic, 3 (a7, m7 and m7e) mac and one other mac of unclear homology (Fig. 32). Abd. I with 1 ms external to a6, 12 (a1–3, a5–6, m2–6 and p5–6) smooth mic and 2 lateral ciliate mac of unclear homology (Fig. 33). Abd. II with 1 central S-chaeta (as), 1 (mi) ciliate and blunt mic, 14 (a2–3, a6–7, m3e, m4, m6–7, p4–5, p5p, p6–7 and el) smooth and subequal mic, 2 (Lm and Li) ciliate and slightly expanded mic, 2 (m3 and m5) ciliate mac with tip expanded, chaetae a2p and ml absent (Fig. 34). Abd. III with 1 central S-chaeta (as) and 1 lateral ms, 5 (a2, mi, ml, em and am6) ciliate mic with tip expanded, 4 (Li, Lm, Li and a6) ciliate modified and fan-shaped mic, 9 (im, a3, a7, m3, m7, p3–5 and p7) smooth mic, 3 (pm6, m7a and p6) ciliate mac (Fig. 35). Abd. IV with 1 anterior (as) and 1 posterior (ps) short S-chaetae and 3 elongate median S-chaetae, 22 (A2–6, B2, B3, Be2, C1–4, C1p, T1, T3, T5–6, D1p, D2–3 and Fe1) smooth mic, 15 (B4–6, T7, D3p, De1, De3, E1–4, F1–3, Fe4 and Fe6) ciliate and mac, 5 (Te3, E4p, E4p2, F3p and F3p2) as mic, 4 (m, a, s and D1) ciliate and strongly fan-shaped mic, 2 (pi and pe) ciliate mic with tip expanded (Fig. 36). Abd. V with 3 S-chaetae (Fig. 37). Abd. IV:Abd. III = 2.6–4.1:1.

Ecology. In leaf litter of Pinus masoniana, Schima superba and Cinamomum camphora, in bryophyta and on farmland.

Remarks. The new species is easily distinguished from other Acrocyrtus by 4 abdominal lateral patches, morphology of interocular chaetae v, r and s, cephalic mac as $R_0R_1R_2ST$, 4 papillae and thicken c-row chaetae on labrum, smooth mic a2, im and C1p on Abd. II, Abd. III and Abd. IV, respectively, unscaled appendages (antennae, ventral tube and legs).

The species is most similar to Acrocyrtus zhujiensis sp. n. in cephalic chaetotaxy, labral papillae, claw, furcula, macrochaetotaxy and S-chaetotaxy. However, the two species are different in colour pattern, morphology of chaetae a2, m3 and m5 on Abd. II, a2 and im on Abd. III, C1p on Abd. IV. Main differences between two new species are listed in Table 1.
Discussion

Dental tubercles are pointed in *Acrocyrtus* and rounded in *Ascocyrtus*. However, it is sometimes uneasy to recognize the shape of dental tubercles. Their shape maybe wrongly observed in different visual angles, pointed in lateral view but “rounded” in facial view. They need to be observed under various angles. Another interesting point is that some species of Yoshii (1982, 1989) with colour patterns similar to our species (pigment on Abd. III) were assigned to *Ascocyrtus* rather than *Acrocyrtus*. Our new species would be placed in *Ascocyrtus* due to habitus compared with those Southeast Asia taxa (Deharveng, personal communication). Actually, more Chinese species with similar patterns in our collection have pointed and relatively long dental tubercles. Since the works of Yoshii, no significant advance has been made for the classification of *Lepidocyrtus s. l*. Molecular tools are expected to help discriminate Lepidocyrtinae genera in the future.

Acknowledgements

The present study was supported by the National Natural Sciences Foundation of China (31101622) and the Knowledge Innovation Program of the Chinese Academy of Sciences (No. KSCX2-EW-J-28). Thanks should be given to Louis Deharveng (Muséum National d’Histoire Naturelle, Paris, France) and two anonymous referees for their useful suggestions.
