Facile synthesis of $\alpha$-alkoxymethyltriphenylphosphonium iodides: new application of PPh$_3$/I$_2$

Humaira Yasmeen Gondal$^1$*, Zain Maqsood Cheema$^{1,2}$, Javid Hussain Zaidi$^3$, Sammer Yousuf$^4$ and M. Iqbal Choudhary$^4$

Abstract
An efficient one pot method for the synthesis of $\alpha$-alkoxymethylphosphonium iodides is developed by using PPh$_3$/I$_2$ combination at room temperature. Reaction conditions are found general to synthesize wide range of structurally variant alkoxymethylphosphonium iodides in high yield (70–91%). These new functionalized phosphonium salts are further used in stereoselective synthesis of vinyl ethers as well as in carbon homologation of aldehydes.

Keywords: Bis-alkoxymethane, PPh$_3$/I$_2$, Quaternary phosphonium salts, O,P-acetals, Carbon homologation, Alkoxymethylphosphonium iodides

Introduction
Functionalized phosphonium salts are gaining much attention for their diverse applications in organic synthesis [1–5]. $\alpha$-Alkoxymethyl phosphonium salts are largely used for carbon homologation to carbonyl compounds [6–10] and also as significant synthetic intermediates [11–17]. Recently, unique reactivity of this class has been explored in nucleophilic substitution [18–20] and in novel phenyl transfer reactions [21, 22]. Methoxymethyltriphenylphosphonium chloride is commercially available salt from this class, but problem associated with its preparation involve toxic intermediate, higher temperature and long reaction time [9, 11, 23]. In perspective of alternative derivatives; $\alpha$-methoxymethyl triphenylphosphonium iodide was reported by reaction of bis-methoxymethane ($1a$) with TMSI, followed by phosphination of methoxymethyl iodide in benzene (Scheme 1a) [24]. This only available method for iodide analogue also involves sensitive and toxic; reagent, solvent as well as intermediate along with difficult purification of product. In past few years, PPh$_3$/I$_2$ combination has successfully facilitated many functional groups interconversions [25–32]. Therefore, we decided to explore reactivity of PPh$_3$/I$_2$ with bis-alkoxymethanes ($1$) and herein efficient synthesis of a broad range of structurally diverse $\alpha$-alkoxymethyl triphenylphosphonium iodides ($2$) is being reported (Scheme 1b). To best of our knowledge, this is the first report on general one pot synthesis of O,P-acetals, directly from dioxacetals on employing PPh$_3$/I$_2$ combination (Scheme 1b).

Results and discussion
Current study was initiated from the model reaction of bis-butoxy methane ($1a$) with PPh$_3$/I$_2$ combination under different conditions (Table 1). Our preliminary attempt was encouraging, where 27% desired conversion ($2a$) was observed on refluxing equal molar amounts of acetal ($1a$) and PPh$_3$/I$_2$ in toluene for an hour (Table 1, entry 1). To improve the yield, reaction time was increased up to 3 h but only 33% required conversion was observed (Table 1, entry 2). Low yield might be associated with the sublimation of iodine at high temperature therefore, it was considered to decrease the reaction temperature. To our delight, yield was increased to 55% when the same experiment was performed at room temperature (Table 1, entry 3). Increasing the amount of PPh$_3$ to 2 equivalent and reaction time up to 5 h further improved the yield.

However, further attempts with increase in reaction time and replacing toluene with ace -
tonitrile or solvent free conditions, were not effectual (Table 1, entry 5–8).

To explore the substrate scope of this reaction, optimized conditions were employed to structurally different
bis-alkoxy methanes (1a–j, see Additional file 1) [33]. The method was found equally efficient to obtain broad range of alkoxymethylphosphonium iodides (2a–j, Table 2) based on primary, secondary, tertiary and benzylic alkoxy groups. Acetals having simple methoxy, ethoxy, benzoxy and phenylethoxy groups provided desired O,P-acetals 2b–e in 75–87%. Similarly, when acetal of (S)-2-butanol was reacted with PPh3/I2, corresponding salt 2f was obtained in 90% yield with retention in configuration, which was ultimately confirmed by X-ray diffraction analysis (Fig. 1).

Optimized reaction conditions were further extended to cyclic chiral alkoxy groups including fenchyl, menthyl, borneyl, where respective chiral phosphonium salts 2g–i were obtained in good yields (Table 2).

Table 1 Conditions optimization for conversion of dioxacetal to O,P-acetal (2a)

* Best optimized conditions

Here, (+)-menthoxymethyltriphenylphosphonium iodide 2h is worth mentioning as its chloride analogue was prepared by tedious methodology with long reaction time [12]. Interestingly, the reaction was also successful with acetal of t-butanol where corresponding salt 2j was produced in 77% yield (Table 2).

In terms of mechanism, we envision that initially I2 and PPh3 generate phosphonium intermediate (i), which reacts with bis-alkoxy methane 1 to provide oxonium intermediate (ii) (Scheme 2). Another equivalent of PPh3 attack on oxonium intermediate (ii) to transform it into the target O,P-acetal 2 (Scheme 2).

After having a range of alkoxymethylphosphonium iodides in hand, we further explored their applications in organic synthesis. Vinyl ethers also known as enol ethers are considered important synthetic targets for the organic chemists. They itself are part of many natural products and also involve as intermediate in their total synthesis [34–36]. They act as key intermediates in many important organic reactions like Diels–Alder reaction [37], Coupling reaction [38–43], Olefin metathesis [44], Claisen rearrangement [45, 46] and Nazarov cyclization [47, 48]. They are also used in materials sciences due to their polymerization ability through cationic mechanism [49]. Despite extensive applications of enol ethers, still there is lack of general and direct method for their synthesis. Metal-catalyzed couplings are the most common available method [50–54], along with some other indirect methodologies [55–62]. Direct synthesis of enol ethers by a Wittig reaction with alkoxymethylphosphonium salt is though an evident concept but no systematic study is found in literature. Most often commercially available methoxymethylphosphonium chloride is used [63, 64], whereas effect of other alkoxy groups as well as counter anions is still need to explore. For this purpose,

**Fig. 1** ORTEP diagram of (S)-2-sec-butoxymethyltriphenylphosphonium iodide 2f
at first ethoxymethyltriphenylphosphonium iodide 2c was reacted with benzaldehyde and its derivatives in the presence of n-BuLi, which afforded corresponding vinyl ethers 3a–d (Table 3) in good yield (67–71%) and selectivity (69–73% trans).

Providentially, trans isomer 3e′ was obtained almost exclusively (99% selectivity) with (+)-menthoxymethyltriphenylphosphonium iodide 2h. Earlier, Fuwa and Sasaki obtained same isomer 3e′ in 9% yield along with 36% cis isomer 3e through Pd coupling [40].

Further, cost effective n-butoxymethylphosphonium iodide 2a was employed for carbon homologation, where both aliphatic and aromatic aldehydes were successfully converted to higher analogous 4 in good yield (Table 4). Results show that these directly prepared and environmentally benign salts are good alternative to their chloride analogues.

To evaluate catalytic potential of chiral phosphonium salts in asymmetric reduction of acetophenone, initially 10 mol% of 2g with NaBH4 provided (R)-1-phenylethanol with 92% yield and 4% ee (Scheme 3).

Detailed study and further investigation on the application of these structurally unique α-alkoxymethylphosphonium salts in stereoselective synthesis of enol ethers carrying chiral auxillaries as well as in other related fields are currently underway in our laboratory.

**Scheme 2** Plausible mechanism for the preparation of alkoxymethylphosphonium iodides 2

**Conclusion**

In conclusion, a facile general method for the synthesis of α-alkoxymethyl triphenylphosphonium iodides is developed under very mild conditions. This protocol demonstrates PPh3/I2 mediated green route to functionalized phosphonium salts. Major advantage of this methodology is to avoid toxic reagent and intermediate. These easily prepared salts were successfully employed for stereoselective synthesis of enol ethers as well as for carbon homologation in aldehydes. The new methodology will be useful for organic synthetic chemists as well as others working in associated fields.

**Experimental**

All experiments were carried out under inert atmosphere using standard Schlenk technique with oven dried glassware and magnetic stirring. All solvents were freshly dried and distilled before use. All chemicals were purchased from Sigma Aldrich, Alfa Aesar and Merck. IR spectra were measured on a Perkin–Elmer Paragon 1000 (thin film) or on a Perkin–Elmer BXII spectrometer (neat). Bruker Avance NMR spectrometer of 300, 400 and 500 MHz were used for NMR spectral studies. Optical rotation was measured on Polarimeter P-2000. Crystal structure was confirmed by single crystal X-ray diffractometer Bruker Enraf–Nonius Apex smart and Siemens P4. Mass spectra were measured on GC–MS.

5977A, MAT312-EI, JEOL-600H-2, and JEOL MS-600H-1. Reactions were monitored by TLC plates from Merck (silica gel 60 F₃₅⁴, aluminum oxide 60 F₃₅⁴). TLCs were visualized by UV fluorescence and phosphomolybdic acid spraying reagent.

General procedure for synthesis of α-alkoxymethyltriphenylphosphonium iodides (2a–j)

In a seal tube triphenylphosphine (20 mmol) and iodine (1.1 equiv) were taken in toluene (4 mL) and mixture was allowed to stir for 5 min. Solution of bis-alkoxymethane (1, 10 mmol in 1 mL toluene) was added to the reaction mixture and allowed to stir for 5 h at room temperature (28 °C). After completion of reaction, solvent was removed under reduced pressure and residue was washed with hexane to obtain required salt.

Butoxymethyltriphenylphosphonium iodide (2a)

Lemon yellow thick oil, yield = 80%, IR: ν (cm⁻¹) = 689, 730, 1115, 1302, 2835. ¹H-NMR (300 MHz, MeOD): δ ppm. 7.93–7.91 (3H, m, CH aromatic), 7.90–7.89 (3H, m, CH aromatic), 7.88–7.79 (2H, m, CH aromatic), 7.78–7.76 (3H, m, CH aromatic), 7.76–7.75 (3H, m, CH aromatic), 7.74–7.72 (1H, m, CH aromatic), 5.40 (2H, d, J = 4.8, CH₂), 3.71 (2H, t, J = 6.4, CH₂), 1.56–1.51 (2H, m, CH₂), 1.28–1.22 (2H, m, CH₂), 0.84 (3H, t, J = 7.6, CH₃). ¹³C-NMR (75 MHz, MeOD): δ ppm. 136.62, 136.60 (2 carbons), 135.25, 135.15, 133.74 (3 carbons), 133.08,

HRMS calculated for C10H11OCl: 182.0493; found 182.0491.

**General method for synthesis of vinyl ethers 3a–e**

In a two neck round bottom flask n-BuLi (1.5 eq) was added to stirred solution of phosphonium iodide 2 (1 eq) in THF at −78 °C and mixture was allowed to stir under argon. After 20 min solution of aldehyde (1 eq) in THF was added drop wise at the same temperature and reaction mixture was allowed to stir for further 4 h allowing the temperature to come to room temperature slowly. Reaction was monitored on TLC, after completion reaction was quenched with methanol and solvent was evaporated under reduced pressure. Products were purified on silica gel column by combinations of ethyl acetate and pet ether as eluent.

$^1$H NMR (400 MHz, CDCl$_3$) $\delta$ ppm 7.31–7.21 (4H, m), 7.01 (0.73H, d, $J = 12.8$), 6.51 (0.29H, d, $J = 7.1$), 5.83 (0.70H, d, $J = 12.8$), 5.69 (0.31H, d, $J = 7.3$), 4.12 (1.42H, q, $J = 7.2$), 3.93 (0.63H, q, $J = 7.5$), 1.45–1.37 (6H, m); HRMS GC/MS calculated for C$_{10}$H$_{11}$OBr: 225.9998; found 225.9988.

1-[(1E & Z)-2-ethoxyethenyl]-4-methoxybenzene (3d–d') [42, 62]

(Mixture of cis and trans isomers) $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ ppm 7.57–7.15 (4H, m), 6.79 (0.63H, d, $J = 13.0$), 6.13 (0.37H, d, $J = 8.0$), 6.10 (0.64H, d, $J = 12.9$), 5.65 (0.38H, d, $J = 7.8$), 3.89 (4H, q, $J = 7.5$), 1.43 (6H, m). HRMS GC/MS calculated for C$_{11}$H$_{14}$O$_2$: 178.0988; found 178.0991.

(E)-2-[(2-isopropyl-5-methylcyclohexyl)oxy]vinyl]benzene (3e') [40]

Colorless oil; yield = 43%. $^1$H NMR (CDCl$_3$, 400 MHz): $\delta$ ppm 7.28–7.22 (4H, m), 7.15–7.11 (1H, m), 6.92 (1H, d, $J = 12.6$), 5.93 (1H, d, $J = 12.6$), 3.62 (1H, td, $J = 4.3$), 2.21–2.10 (2H, m), 1.72–1.71 (1H, m), 1.58–1.52 (1H, m), 1.49–1.39 (2H, m), 1.11–1.01 (2H, m), 0.95 (3H, d, $J = 6.16$), 0.94 (3H, d, $J = 6.6$), 0.82 (3H, d, $J = 6.9$), $^{13}$C NMR (CDCl$_3$, 100 MHz): $\delta$ ppm 147.5, 136.7, 128.6 (2C), 125.4 (2C), 124.9, 107.0, 81.6, 47.8, 41.4, 34.3, 31.5, 25.8, 23.4, 22.1, 20.7, 16.4. HRMS GC/MS calculated for C$_{18}$H$_{20}$O: 258.1984, found; 258.1987.

General method for carbon homologation in aldehydes

In a two neck round bottom flask containing phosphonium iodide 2a (1 eq) in dry THF (5 mL), n-BuLi (1.5 eq) was added dropwise at $-78$ °C and mixture was allowed to stir for 30 min. Solution of aldehyde (1 eq) in THF was added dropwise to the phosphine reaction mixture and further allowed to stir for 5 h. After acidic hydrolysis, crude product was extracted with EtOAc (10 mL × 2). Combined extract was dried over Na$_2$SO$_4$ concentrated and purified on preparative TLC (silica gel) to obtain higher analogue of aldehydes (see Additional file 1).

General procedure for asymmetric reduction reaction

In a two-neck round bottom flask, acetophenone (1.5 mmol), NaBH$_4$ (2.25 mmol) along with iodide salt 2g (10 mol%) was taken in methanol (5 mL). Reaction mixture was stirred for 2 h at room temperature. The reaction progress was monitored by TLC and after completion, the mixture was quenched with water and extracted EtOAc (2 × 3 mL). Combined organic layer was dried over MgSO$_4$ and the solvent was evaporated under reduced pressure to afford the corresponding (R)-1-phenylethanol (92% yield, 4% ee). Enantiomeric excess (ee) was calculated on HPLC using chiral cellulose OD-H column, hexane/i-PrOH, 95:5, flow rate 1 mL/min (see Additional file 1).

Additional file

Additional file 1. General method for synthesis of bis-alkoxy methanes.

Additional file 2. Carbon Homologation in aldehydes.

Additional file 3. Asymmetric reduction of acetophenone.

Additional file 4. Crystallography data for(3)-sec-Butoxymethyltriphenylphosphonium iodide.

Additional file 5. Specimen NMR Spectra of alkoxymethyltriphenylphosphonium iodides.

Additional file 6. Specimen NMR Spectrum of vinyl ether.

Authors’ contributions

HYG designed and supervised the project and wrote the paper. ZMC performed experiments and assist in manuscript preparation. JHZ guided in data interpretation and reaction mechanism. SY solved X-ray structure. MIC provided instrumental facilities. All authors read and approved the final manuscript.

Author details

1 Department of Chemistry, University of Sargodha, Sargodha 40100, Pakistan.
2 Department of Chemistry, University of Sheffield, Sheffield, UK. 3 Department of Chemistry, Quaid-I-Azam University, Islamabad 45320, Pakistan. 4 H.E.J Research Institute of Chemistry, ICCBS, University of Karachi, Karachi 75270, Pakistan.

Acknowledgements

Authors are obliged to Pakistan Science Foundation (PSF) Islamabad for support of this research project (P-US/Chem-427). We are also grateful to HEJ Research Institute of Chemistry, ICCBS Karachi for providing analytical facilities.

Availability of data

CCDC. 1537362 contains the supplementary crystallographic data for this paper. These data can be obtained free of charge via http://www.ccdc.cam.ac.uk/conts/retrieving.html (or from the Cambridge Crystallographic Data Centre, 12, Union Road, Cambridge CB2 1EZ, UK; fax: +44 1223 336033; or deposit@ccdc.cam.ac.uk). General procedure and spectral data of substrates bis-alkoxy methanes (1) and specimen NMR spectra of α-alkoxymethyl phosphonium iodides (2) and vinyl ethers (3) are given in Additional file 1.
