ABSTRACT

Objective The term health information exchange (HIE) is often used in health informatics, yet uncertainties remain about its precise meaning. This scoping review aimed to capture and analyse existing definitions in order to map variations in the use of this term and the concepts associated with it.

Methods Systematic literature search to identify published definitions of HIE and related terms. Medline, Web of Science, Library Information Science and Technology Abstracts, EMBASE and CINAHL Plus were searched to identify relevant papers, and Google to identify grey literature. Searches were not limited by language or date of publication. Both explicit and equivalent conceptual definitions were included. Included definitions were summarised and thematically analysed in order to identify and map the underpinning constructs.

Results Our searches revealed 603 scientific articles and 5981 website links. From these, a total of 268 unique definitions of HIE were identified and extracted: 103 from scientific databases and 165 from Google. Eleven constructs emerged from the thematic analysis. Contextual factors influenced the emphasis of the definitions and the overall framing of HIE as an organisational entity that facilitates and or as a process of sharing health information between diverse stakeholders.

Conclusions HIE is a complex and evolving construct, for which multiple definitions exist. In order to encourage consensus, the authors propose this broad definition, which encompasses the key attributes of HIE described in the literature: “HIE is the electronic mobilisation of clinical and administrative information within or across organisations in a region or community and, potentially, internationally between various systems according to locally and/or nationally recognised standards while maintaining the authenticity and accuracy of the information being exchanged, enabling stakeholders to make informed decisions to enhance healthcare quality of a patient and population. HIEs are multi-stakeholder organisations that oversee the business, operational and legal issues involved in the exchange of information.”

Keywords: eHealth, health informatics, health information exchange, scoping review
INTRODUCTION

Effectively delivering integrated patient care and business transactions within the healthcare ecosystem requires the exchange of patient-related data between stakeholders within and across organisations, in order to support clinical decision making and organisational functions such as insurer reimbursement. The process of transferring or sharing this information using information and communications technologies is often referred to as electronic health information exchange (HIE). Much of the current narrative around HIE has been centred around the United States (US) policy context, arising from the Health Information Technology for Economic and Clinical Health (HITECH) Act. This aims to improve the efficiency, consistency, safety and equity of healthcare services through better information sharing between relevant stakeholders, contingent upon the ‘meaningful use’ of electronic health records (EHRs), and is backed by a programme of financial incentives and penalties to encourage change. These developments have drawn particular attention to HIE in the US, although the same activities are being undertaken internationally. The screenshot in Figure 1 shows the number of global Google searches, since 2004, for the specific term ‘HIE’ (lower line) and the topic more generally, which is computed from several indicators (upper line).

Much of the web traffic shown in Figure 1 is driven from the US and closely reflects the ‘meaningful use’ agenda, which has important but somewhat different implications for clinicians, healthcare delivery organisations, insurers and healthcare information technology providers. It also reflects the explicit use of the search term ‘HIE’, which is close-coupled with the US policy and business environment.

Although the term HIE is widely used, the way in which it is used varies in significant ways across stakeholders and contexts, including policymakers, academic institutions, professional organisations and funding bodies. Examples of diversity include ‘occupational’ HIE, HIE as a feature of the EHR and HIE as a corporate network of data warehouses serving a health organisation. This raises the potential for ambiguous or inconsistent definitions to hinder meaningful dialogue around health informatics policy, research and practice. For this reason, we decided to undertake a detailed scoping review in order to analyse the ways in which the term is being interpreted in the literature and how these vary across different organisations and contexts. The research therefore set out to answer the question “What is HIE?” with reference to the ways in which it has been defined and the concepts underpinning these definitions. The approach was inspired by earlier scoping reviews of eHealth and aimed to clarify the different uses of the term to in order aid the sharing of information about HIE across stakeholders and inform emerging taxonomies in health informatics.

METHODS

Design

Systematic scoping review of the published and grey literature.

Inclusion criteria

Definitions appearing in print or digital format were searched that explicitly refer to HIE or equivalent terms such as clinical information exchange and healthcare information exchange, as well as related concepts such as electronic data interchange (EDI). ‘Definition’ was taken to include explicit statements of the meaning of the term with reference to key concepts (e.g. ‘HIE is the movement of patient information across nodes of a health system using health information technologies and standards for data exchange’) and conceptual definitions, in the form of functional descriptions of HIE (e.g. ‘organisations exchange health information

Figure 1 Google searches for HIE as a search string and a topic, since 2005.
Source: Google Trends. Computed on 22 March 2015
using middleware systems and interoperability standards such as HL7).

Exclusion criteria
References to HIE not accompanied by either an explicit or an implied definition (as above) were excluded.

Search strategy
Searches were not limited by language. The searches covered the period from 1900 to February 2014.
Web searches: AA and CP first conducted a Google search using the narrative terms shown in Table 1.

Scientific databases
The explicit search terms and structured queries shown in Table 2 were used to interrogate Medline; Web of Science; Library Information Science and Technology Abstracts; EMBASE; and CINAHL Plus. There was no medical subject heading (MeSH) term available for HIE, clinical information exchange or healthcare information exchange and hence the reliance on key words.
Query strings were adapted as necessary for each academic database and for the purposes of Google searching. Titles, abstracts and text of the citations identified in the academic database were independently reviewed by two authors (AA and CP) before articles were retrieved for further analysis. Any disagreements between the investigators were resolved by a third reviewer (AS).
Reference lists of the included articles were also scrutinised for any relevant sources and cited work. Websites included reports, encyclopaedias, dictionaries, blogs, hospitals, vendors, letters, presentations, documents, white papers, articles and references. Duplicate citations and definitions were excluded from the results.

Data extraction
Data extraction tables were prepared to include details of the definition, author, source, year and country of origin. Duplicates appearing in more than one database were excluded prior to further analysis.

Analysis
As this was a scoping review of definitions, rather than a systematic review of research evidence, analysis did not involve appraisal of study quality. All potentially relevant articles identified by the search were analysed by hand in order to determine whether they contained an explicit definition of the term or an equivalent conceptual definition. Definitions were descriptively

| Search string | Hits | Total results viewed | Unique definitions included |
|---------------|------|----------------------|----------------------------|
| What is health information exchange definition | 33,000,000 | 1000 (100 pages) | 61 |
| HIE definition | 32,200,000 | 1000 (100 pages) | 13 |
| What is HIE? | 38,900,000 | 997 (100 pages) | 35 |
| What is HIE (health exchange) | 2,160,000 | 991 (100 pages) | 42 |
| Clinical information exchange | 20,300,000 | 993 (100 pages) | 10 |
| Health care information exchange | 111,000,000 | 1000 (100 pages) | 13 |

| Database | Search string | Keyword/topic | Hits | Results after duplication removed | Unique definitions included |
|----------|---------------|---------------|------|----------------------------------|-----------------------------|
| Medline  | ‘Health information exchange’ or ‘clinical information exchange’ or ‘health care information exchange’ | Keyword | 400 | 23 | 14 |
| Web of science | ‘Health information exchange’ or ‘clinical information exchange’ or ‘health care information exchange’ | Topic | 408 | 50 | 30 |
| Library information science and technology abstracts | ‘Health information exchange’ or ‘clinical information exchange’ or ‘health care information exchange’ | Keyword | 81 | 70 | 2 |
| EMBASE | ‘Health information exchange’ or ‘clinical information exchange’ or ‘health care information exchange’ | Keyword | 460 | 293 | 69 |
| CINAHL plus | ‘Health information exchange’ or ‘clinical information exchange’ or ‘health care information exchange’ | Keyword | 230 | 167 | 9 |
analysed according to publication date, geographical origin, provenance, and terminology used. AA undertook a high-level pass through the data to create a draft coding framework, which was refined in consultation with CP before beginning the coding process.\textsuperscript{8,12} Definitions were then thematically analysed, with each definition coded according to its various qualitative attributes. The codes were iteratively adapted in order to achieve the best fit with the data, equivalent to qualitative research, where coding proceeds until the point of ‘saturation’ where no new codes were required to describe the data.

RESULTS

The Google search yielded 5981 Web pages referring to the term HIE, whilst the searches of scientific databases revealed 603 articles referring to HIE (see Figure 2). These were analysed in order to determine whether they contained an explicit or conceptual definition.

Table 3 shows the number of definitions (see also Appendix A) extracted from Google and scientific databases. Definitions dated back to the year 1957.\textsuperscript{15} Definitions ranged in length from 1116 to 146 words.\textsuperscript{17} Most of the definitions were from the US. See Table 4 for the number of definitions from various countries and regions. Other terms closely related to HIE found were ‘electronic data interchange’,\textsuperscript{18–20} ‘clinical information exchange’,\textsuperscript{21–26} ‘clinical document exchange’,\textsuperscript{27} ‘clinical HIE’,\textsuperscript{28,29} ‘healthcare information exchange’,\textsuperscript{30–35} ‘medical data exchange’\textsuperscript{36} and ‘information exchange’.\textsuperscript{37}

KEY THEMES IDENTIFIED

The objective of facilitating exchange of health information among different systems or stakeholders was represented in the majority of definitions (See Appendices A and B).

The analysis of the included definitions revealed 11 main conceptual themes. In Table 5, these are arranged according to their frequency in the corpus of included definitions, while

Figure 2 PRISMA diagram of HIE scoping review
Figure 3 represents them in terms of themes and sub-themes (not in the order of frequency). A more detailed breakdown of subthemes and their frequencies may be found in Appendix B. (Many definitions embedded a range of concepts and were thus tagged with more than one code or theme.)

The concepts represented within each higher order theme are described below.

**Usage of data and information**
The theme ‘data and information’ was divided into sub-categories that included ‘healthcare information’, ‘health records’, ‘claims and administrative’ and ‘demographic data.’

**Health care information**
Definitions referring to the types of information that could be shared, accessed or exchanged are given in Box 1.

**Health records**
Healthcare information was categorised into various types of health records as given in Box 2.

**Box 1 Terms used to represent healthcare information**

| Terms                                                                 | References |
|----------------------------------------------------------------------|------------|
| ‘Health information’                                                                                               |
| ‘Clinical information’                                                                                             |
| ‘Clinical data’                                                                                                     |
| ‘Patient data’                                                                                                      |
| ‘Healthcare information’                                                                                             |
| ‘Clinical patient data’                                                                                              |
| ‘Patient clinical data’                                                                                               |
| ‘Patient information’                                                                                                 |
| ‘Medical information’                                                                                                 |
| ‘Health-related information’                                                                                          |
| ‘International Classification of Diseases’                                                                             |
| ‘Surgical procedures’                                                                                                |
| ‘Provider health records’                                                                                             |
| ‘Digital medical records’                                                                                             |
| ‘Electronic medical record’ (EMR)                                                                                      |
| ‘Electronic patient records’                                                                                            |
| ‘Healthcare-related data’                                                                                            |
| ‘Health surveillance data’                                                                                            |
| ‘Electronic health records’                                                                                           |
| ‘Patient clinical records’                                                                                            |

**Box 2 Terms used to represent types of health records**

| Terms                                                                 | References |
|----------------------------------------------------------------------|------------|
| ‘Paper records’                                                                                                      |
| ‘Provider health records’                                                                                             |
| ‘State registries’                                                                                                     |
| ‘Digital medical records’                                                                                             |
| ‘EHR’                                                                                                               |
| ‘Care records’                                                                                                       |
| ‘Personal health record’                                                                                            |
| ‘Patient health records’                                                                                            |
| ‘Electronic patient records’                                                                                          |
| ‘Patient clinical records’                                                                                            |

Further, the contents of healthcare information and health records included are given in Box 3.
Defining health information exchange: scoping review of published definitions

Figure 3 HIE themes
Box 3 Terms used to represent ‘contents’ of healthcare information and health records

- ‘Problem lists’, 41, 105 ‘illness’, 96, 185 ‘injuries’, 96
- ‘procedures’, 42, 105, 126, 158, 184 ‘test results’, 98, 96, 105, 185, 213, 214
- ‘radiology reports’, 88, 207, 215, 216 ‘allergies’, 88, 96, 105, 131, 185
- ‘images’ and prescriptions, 41, 184 ‘medicines’, 96, 185
- ‘medications’ lists, 41, 88, 105, 126, 131
- ‘hospitalization summaries’ 88 and ‘discharge summaries’. 94, 105, 195

Claims and administrative data

Other health information involved claims and administrative data (see Box 4).

Box 4 Terms used to represent claims and administrative data

Claims related to ‘health insurance and payments’, 20 ‘claims information’ 217 and ‘health encounter claims’, 79 whereas administrative data were labelled as ‘administerative health data’, 69 administrative data, 168 ‘administrative information’ 117, 198 and ‘orders’ 165

Demographic data

Demographic items such as name, date of birth, address and insurance of the patients were exchanged along with the clinical information. 27, 42, 88, 186, 187

Information transfer as a function

Nearly, all the included definitions referred to health information are being exchanged through electronic processes. Words and expressions used to describe this process or its direction are given in Box 5.

Box 5 Terms used to represent information transfer

- ‘Exchange’, 55–57, 141 ‘access’, 59, 82, 138, 207, 218–220
- ‘movement’, 154, 163, 172, 173, 175–177, 221 ‘sharing’, 2, 59, 99, 200, 222
- ‘multi-directional transfer’, 223 ‘moving’, 127, 224, 225
- ‘bi-directional’, 47, 191, 194 ‘mobilizes’, 226 ‘connectivity’, 54
- ‘data flow’, 122 ‘transferring’, 55, 61 ‘transfer’, 58, 70, 109, 112, 11
- 5, 133, 160, 216 ‘feed data repositories’, 109 ‘transmission’, 7, 6, 80, 186, 188, 189, 217, 227, 228 ‘transport’, 49, 100, 184 ‘moves’, 162
- ‘access to and retrieval’, 87, 110, 111, 115, 121, 130, 160 and ‘link’/’linking’. 191, 229–231

Further, health information was being exchanged and transferred through different mediums and methods such as ‘e-transfer’, 55 ‘application-level communication’, 49 ‘email’ 195, 210 and ‘secure messaging’. 196

Stakeholders involved in HIE

The third theme related to the range of stakeholders engaged in HIE, as shown in Box 6:

Box 6 Terms used to represent different types of stakeholders involved in HIE

- ‘Doctors’, 67, 69, 85, 96, 142, 156, 156, 179, 184, 185, 232–234 or ‘physicians’, 21, 77–79, 123, 144, 162, 235–237
- ‘clinicians’, 1, 56, 87, 97, 109, 131, 135, 161, 213, 218, 238–240

‘nurses’, 85, 166, 184, 234, 241, 242 ‘patients’, 5, 38, 90, 109, 133, 138, 206
- ‘pharmacists’, 86, 166, 184 ‘health educators’, 66
- ‘public health officials’, 133 ‘healthcare professionals’, 29, 33, 36
- ‘medical professionals’, 90 and ‘insurers’, 142
- ‘payers’, 69, 77, 175, 217, 243 ‘policy makers’, 233 ‘social workers’, 66 ‘healthcare providers’, 25, 58, 90, 105, 126, 141, 152, 154, 170, 196, 197, 205, 208, 222, 230, 244 ‘customers’, 44 ‘hospitals’, 19, 23, 99, 101, 120, 123, 222, 245 ‘health plans’, 21, 67, 78, 79, 171 ‘laboratories’, 67, 77, 85, 246 ‘radiology centres’, 88 ‘pharmacies’, 33, 67, 85, 131, 142, 162, 163, 183, 235, 246, 247 ‘hospitals’, 21, 32, 124, 184, 195, 215, 222, 237 ‘organizations’, 134, 22, 3, 226, 248, 249 ‘institutions’, 34, 36, 44, 99, 141, 250–252 ‘emergency departments’, 25, 128, 142, 213 ‘nursing homes’, 101, 123 ‘clinics’ (ambulatory/community), 32, 79, 114, 120, 124, 216 ‘quality assurance groups’, 114 ‘government agencies’, 118, 188–190
- ‘state agencies’, 79 ‘public health agencies’, 84, 101, 174, 175, 237, 243 ‘public health facilities’, 79 ‘public health entities’, 114 ‘health information organizations’, 188–190 ‘insurance companies’, 18, 33 ‘research groups’, 114 ‘public health departments’ 123 and ‘federal reporting entities’. 253

Some descriptions of stakeholders were more general, as shown in Box 7:

Box 7 Other terms for stakeholders

‘Stakeholders’ 52, 60, 74, 81, 106, 117, 126, 127, 181, 254 ‘multi-stakeholders’, 69, 92, 195, 241 ‘public–private stakeholders’, 91 ‘public health stakeholders’, 254 ‘other or third parties’ 17, 143 and “other healthcare providers.” 25, 154

Potential benefits of HIE

Many definitions emphasised the benefits and potential benefits of using HIE, although these were framed in different ways. The dominant benefit was being able to transfer information in a secure way (see Box 8). Other themes related to healthcare quality, timeliness, improved decision making and patient centredness.

Box 8 Terms used to represent potential benefits of HIE

Information security, 25, 30, 43, 60, 70, 89, 95, 98, 100, 127, 153, 157, 164, 173, 182, 191, 198, 227, 234, 238, 245, 255 ‘coded’, 41, 195 improved capacity for informed ‘decisions’, 17, 27, 38, 47, 65, 69, 83, 109, 116, 152, 229, 245, 257, 255 ‘effective’, 21, 71, 103, 115, 121, 129, 160, 234, 252 ‘efficient’, 33, 84, 95, 121, 148, 160, 233–235 ‘safer’, 37, 71, 87, 110, 111, 121, 233 ‘coordinated’, 81, 234 ‘equitable’, 37, 71, 110, 111, 115, 121, 129, 130 ‘timelier’, 103, 121 ‘patient-centred healthcare’, 37, 71, 84, 110, 111, 115, 121, 129, 130 ‘real-time’ information transfer’, 27, 99, 139, 164, 198, 246 enhance ‘quality of healthcare’, 53, 59, 106, 132, 141, 213, 235 reduce costs, 2, 146, 177, 216, 250, 258 deliver ‘accurate’, 97, 107, 213, 247 ‘seamless’, 47, 99, 140, 255 ‘empowerment’ 83 and ‘complete’, 27, 97, 118, 144, 150, 161, 212, 222, 240, 259

Technology required for HIE

Almost all of the definitions referred to ‘electronic’ or ‘digital’ data exchange. Most referred to the information infrastructure, systems or technology platforms used to host, transfer...
or exchange these data. Other related terms included those in Box 9.

**Box 9 Terms used to represent information technology**

- ‘Technology platform’,43,47,165,225,260
- ‘network infrastructure’,42,102,109,126,131,219,227,249,260–269
- ‘health information technology’,154,172,189
- ‘computer-based systems’,226
- ‘technology model’126
- ‘information technology’
- ‘HIE systems’,271,272
- ‘document exchange system’,26,27,253
- ‘use of ‘online metadata registry’,242
- ‘powerful technology’,273
- ‘Web-based delivery systems’,215
- ‘technical infrastructure’,133,267
- ‘information infrastructure’,274
- ‘electronic networks’,106
- ‘electronic system’,152
- ‘portal’,41
- ‘computer network’,187
- ‘interoperable technologies’,275
- ‘central information systems’,159
- ‘collection of activities and technologies’,104,276
- ‘component of innovative’,277
- ‘friendly user interfaces’,278
- ‘secured website’,116,170
- ‘communication based on Web services’,51
- ‘health care technology’,96
- ‘health information systems’,265
- ‘mobile computing technology’,119
- ‘hubs’,136
- ‘open source’231
- ‘data formats’.249

**Focus/context of use**

Different definitions also considered HIE with reference to its different contexts of use (see Box 10).

**Box 10 Examples of HIE in different contexts of use/focus**

- For instance, ‘nursing interventions’,279
- ‘registered nurses’ working in home healthcare improving the quality of care through HIE
- ‘contributing to ‘emergency departments’24,119,124,142,161,213,239
- and focusing on preventive and outcome-based medicines.158
- ‘HIE was also used for occupational health,15 mental health,280
- HIV/86,230 cancer care31 and cardiac surgery.119
- It is also referred as a ‘set of activities’ to transfer information from one place to another,201,281
- as a component of eHealth,43,246
- as a method of utilising EHR81,144,169,204,209
- or electronic patient record212 and as an important requirement of Stage 1 ‘meaningful use’ for hospitals.75,105,203,209,282

HIE was seen as an entity, organisation as well as a process as described below.

**HIE as an entity or organisation**

In many definitions, HIE was labelled as an ‘entity’60,70,73,74,77,83,143,227,283 that was established to exchange health information in a secure manner. It has also been prefixed as ‘legal entity’60 and ‘person or governmental entity’.227

In some definitions, HIEs were conceived as ‘organisations’186,284 or sets of organisational ‘services’ and infrastructures to support or streamline the exchange of health information.72,149,165,197,206,285,75,263,267,130

**Box 11 Examples of HIE used as an entity or organisation**

- Here HIE was used as a ‘noun’, to describe an entity responsible for the exchange of health information.186,217,284
- The term HIE was synonymously interchanged with local health information organisations,181
- regional health information organisations (RHIOs)23,45,50,63,72,102,181,207,286 and sub-network organisations.181
- HIEs were occasionally recognised as multi-stakeholder organisations responsible for managing business and legal matters involved in the exchange of information.59
- Moreover, HIEs were even regarded as the foundational part of accountable care organisations (ACOs)113
- because they allowed EMRs to exchange information between various types of medical records. The other way around, HIEs were important for organisations that are transitioning into ACOs.84

**HIE as a process**

Here HIE was considered as the procedure involved in transferring electronic or digital health data in a protected environment among multi-stakeholders.68,81,145,178,180,200,223,224,235,261,283,284

Moreover, it was the process of utilising technology and systems to capture, store, share and retrieve the data electronically.35,48

In a few definitions, HIE was also reflected as a ‘verb’, an action, a process responsible for transmitting health information17,186,217,284 and collaboration among providers.21,32,94,117,171

**Data standards**

Incompatibility between systems and software has presented a barrier to HIE, and for this reason, the importance of interoperability standards is emphasised in the majority of definitions.

Keywords and phrases related to this are given in Box 12.

**Box 12 Terms used to represent the use of data standards**

- ‘Standards’,180,201
- ‘nationally recognized standards’,100,121,13
- ‘nationally recognized vocabularies’,195
- ‘policies and standards’,133
- ‘standardise’,149,152,208,254
- ‘standardized content’,49
- ‘standard procedures’,129
- ‘ nationwide standards’,283
- ‘national standards’,153,188–190
- ‘standards-based infrastructure’,30
- ‘cross-enterprise document sharing (XDS)’,186
- ‘Health Insurance Portability and Accountability Act (HIPAA) standards’.89

**Connectivity between different ‘locations’**

Definitions falling within this theme emphasised the exchange of information among facilities or organisations located in different areas (see Box 13).
Public health outcomes

The uses of HIE in population health were stressed in a number of definitions, Relevant concepts covered the uses of HIE for supporting public and community health practices, population health monitoring and research (see Box 14).

Box 14 Terms used to represent public health functions of HIE

Concepts included connecting ‘public health departments’ supporting ‘public health practices’, undertaking ‘public health activities’, linking ‘public health surveillance data’, ‘public health reporting’, evaluation and planning of ‘public health services’, ‘public health event-monitoring capability’, analysing the ‘health of the population’, ‘countrywide population health’, ‘statistics for public health’, assisting ‘public well-being’, protecting ‘public interest’, ‘public health organizations’, promote ‘population health’, health data on a ‘population level’, ‘track population health’, refine ‘US health care system’, HIE for a ‘16-county region’ and ‘community betterment’.

Business solutions/objectives of HIE

A number of definitions conceived of HIE as either a commercial solution facilitating information exchange or in terms of its business objectives. It was suggested that HIE will come up with their viable business plans when stimulus funding from the government will end.

Box 15 Examples of HIE as business solutions/objectives

- One vendor represented itself as a national HIE ‘company’, while other definitions emphasised issues like scalability and efficiency.
- Siemens offered a four-dimensional HIE ‘solution’, organised according to ‘economics’, ‘care’, ‘service’ and ‘technology’.

---

Transactions between providers or between services or suppliers often involve secure data exchange. This may be conceived in terms of ‘data supplier and data receiver’ but also ‘competitors’ and ‘customers’. HIE has been spoken about in terms of exchanging health information across traditional business boundaries and also characterized as ‘large multi-billion dollar efforts’.

HIE has also been characterised as an infrastructure that includes business models, technology model and the legal model to facilitate the exchange of information among various organisations.

The ‘primary business focus’ of networks involved in building HIEs was to create value for the provider community by forming ‘productive efficiencies’.

One of the authors termed HIE as entities built on ‘bilateral legal agreements’ between proprietary information systems to be able to share different kinds of data. HIE is seen as an administrative as well as a clinical tool, and as a tool for exchanging insurance information.

---

DISCUSSION

The analysis has revealed considerable variability among existing definitions of HIE and insights into the range of concepts that are embedded within these definitions.

Many definitions included not only the exchange of patient information but also other types of information such as demographics, claims and administrative data. Definitions also described health information sharing and connectivity at the level of organisations, states or regions and nations, possibly reflecting the different ways in which care is organised in different national contexts.

While the US government has provided incentives for the adoption of HIE, securing long-term funding is a major challenge for sustainability. Implementing HIE represents an investment and not simply a cost and this is accompanied by a realisation that policy makers must find approaches to assure that all stakeholders who benefit from HIE pay to support it and specifically that efforts should be made to engage private payers.

A wide variety of stakeholders are engaged in HIE, not only including healthcare professionals and patients but also policy makers, researchers, and insurance companies.
for example. Although infrastructural, economic, technical and cultural barriers have impeded the participation of some stakeholder groups in HIE efforts, it remains the core of the vision for a connected, coordinated and learning health system.294

Not surprisingly, the majority of definitions highlighted the importance of secure information exchange and many pointed to the requirement for common data standards necessary for the quality of data content, clinical documentation, data mapping and, most importantly, interoperability between disparate systems.201 Common standards will also ensure data protection, confidentiality, interoperability and privacy.29,129,189,228

The value of HIE for supporting public health is referred to in many of the definitions, with the ability to meaningfully move clinical data across disparate systems being seen as vital for effective health surveillance and management of care delivered outside health facilities.295

### Strengths and limitations

This review aimed to identify, classify and map definitions of HIE and was not intended as an in-depth analysis of the challenges and opportunities presented by HIE, although such issues were inevitably reflected in many of the definitions. The search terms used to identify definitions of HIE were limited to those that we considered most relevant and it is possible that extending them to include other pertinent concepts in health informatics might have revealed further descriptions of HIE and HIE-like concepts. However, we have followed previous authors in prioritising the search for explicit definitions, as a means of generating insights into how the concepts has evolved and how it is being discussed.8,12 Using both research databases and a general web search engine gave us greater scope to reach both academic and non-academic literature. Internet searches were restricted to Google and while it is possible that additional definitions may have been found using other search engines, the very large number of hits produced by our queries suggests that it was an effective means of identifying the majority of relevant content in the online grey literature.

The included definitions reflect the dominance of the US literature pertaining to HIE and, to some extent, the language used to describe information sharing concepts in that national context. We acknowledge this limitation, interpreting it as a consequence of the major investment in HIE in the US over recent years, with its inevitable knock-on effects on the volume of literature emerging from that part of the world. As the term gains wider international currency and other countries prioritise investments in HIE, this national balance may change. Nevertheless, a post-hoc analysis excluding the US definitions revealed similar themes as found across our entire corpus of 268 definitions, which encompasses research pre-HIPPA, suggesting that that the concept and function of HIE is similar in different parts of the world and has consistencies over time (Table 6).

### Implications for research, practice and policy

The definitions of HIE appearing in the literature vary on a number of philosophical and conceptual attributes, and many are context specific. The ways in which different authors choose to describe concepts is inevitably influenced by their backgrounds and vested interests and it is therefore not surprising to observe the differences in emphasis. However, we were struck by the clear alignment of the HIE concept with specific technologies or business opportunities in some definitions, where HIE is used describe a service, an organisation or a technology, rather than a process or concept. Such a language was often used by businesses promoting their products or in the context of state information systems, where ‘the exchange’ is pictured as an operational entity. This creates important obstacles to communication about HIE, particularly for policymakers involved in making decisions about strategy and procurements.

We have not found a single definition that encompasses all of the key attributes of HIE identified by our thematic analysis. The one suggested by Finn69 is one of the most comprehensive and differentiates ‘HIE’ as a concept related to the processes of data transfer and sharing, and ‘HIEs’ as entities responsible for overseeing effective HIE, while also recognising the benefits, scope and stakeholders involved.69 The broad concept of HIE also describes a set of enabling technologies that support these processes, including data standards and public health objectives. The use of HIE as a noun describing organisational entities concerned with mediation and governance of information transfers is largely, although not exclusively, a US phenomenon and also qualitatively different from process-oriented definitions. It has therefore been placed in separate sentence. Based on our review, we proposed the following integrated definition of HIE shown in Box 17, which is a heavily adapted version of the one proposed by Finn.69

| Themes Frequency of occurrence in % |
|-------------------------------------|
| Usage of ‘data and information’      | 90%        |
| ‘Information transfer as a function’ | 90%        |
| ‘Stakeholders’ involved in HIE      | 71.4%      |
| Technology’ required for HIE        | 57%        |
| ‘Potential benefits’ of HIE         | 47.6%      |
| ‘Data standards’                    | 28.5%      |
| Connectivity between different ‘locations’ | 23.8% |
| ‘Focus’/ ‘context of use’           | 23.8%      |
| ‘Business’ objectives of HIE         | 9.5%       |
| ‘Public health’ outcomes             | 4.7%       |
Health information exchange (HIE) is the electronic mobilisation of clinical and administrative information within or across organisations in a region or community and, potentially, internationally between various systems according to locally and/or nationally recognised standards while maintaining the authenticity and accuracy of the information being exchanged, enabling stakeholders to make informed decisions to enhance healthcare quality of a patient and population. HIEs are multi-stakeholder organisations that oversee the business, operational and legal issues involved in the exchange of information.

While this definition may not be ideally suited to all contexts (such as HIE for specific diseases and/or community HIE), we believe it provides a good overall fit with the themes identified in the heterogeneous corpus of definitions revealed by our review and therefore propose it for possible wider adoption (see Figure 4).

CONCLUSIONS
This review has shed light on the different facets of HIE. In the spirit of promoting further scholarly discussion and debate, we have proposed a definition that encompasses the key underpinning constructs. We recommend that future authors consider the findings of this review before developing new definitions of HIE, in order to avoid adding further heterogeneity. We also hope the review has value for policymakers involved in planning, procurement and evaluation of HIE.

Funding
We would like to thank Higher Education Commission Pakistan and The University of Edinburgh for providing funds for this review.

Acknowledgement
We wish to record our appreciation to Professor Brian McKinstry and the anonymous reviewers for their comments on an earlier draft of this manuscript.

### Appendix A: Extracted Definitions

| S.No. | Author | Source | Year of Publication | Country | Definition |
|-------|--------|--------|---------------------|---------|------------|
| 1.    | 1st PC (178) | Web page: 1st Providers Choice, Solution Provider | Unknown | US | Health Information Exchange (HIE) refers to the process of reliable and interoperable electronic health-related information sharing conducted in a manner that protects the confidentiality, privacy, and security of the information. |
| 2.    | 4Med (188) | Web page: Educational Resource for Healthcare Information Technology | Unknown | US | Health Information Exchange (HIE) represents the transmission of healthcare-related data among facilities, health information organizations (HIO) and government agencies according to national standards. HIE is an integral component of the health information technology (HIT) infrastructure under development in the United States and the associated National Health Information Network (NHIN). |
| 3.    | Abhyankar et al (215) | Scientific | 2010 | US | Some regional health information exchanges (HIEs) provide web-based delivery systems that accept lab results messages from many sources (e.g. hospital laboratory, stand-alone radiology services) and deliver them in a uniform format to physician offices. |
| 4.    | Accenx (165) | Web page: Healthcare information technology & IT strategy news | 2009 | US | The Accenx Exchange is a health information exchange (HIE) services platform that brings the medical records in any given community much closer together by actually extending the reach out to the physician practices, hospitals and other healthcare organizations. It allows public or private HIEs to immediately establish a technology and service platform for sharing clinical results, orders and other patient information among providers using virtually any EMR system - or no EMR at all. |
| 5.    | Adler-Milstein et al (122) | Scientific | 2011 | US | Central goal of the legislation was to promote broad-based electronic HIE, in which key clinical data flow among providers and between providers and other stakeholders, such as public health departments. |
| 6.    | Adler-Milstein et al (54) | Scientific | 2011 | US | Health information exchange enables patients’ health information to follow them between delivery settings in order to support care coordination and avoid duplication of services. There is broad consensus that such connectivity is critical to improving care and reducing healthcare costs. |
| 7.    | Adler-Milstein and Jha (123) | Scientific | 2012 | US | Health information exchange (HIE) is the act of sharing clinical data among health care practitioners and practice settings (physicians, hospitals, nursing homes, etc) who are not part of the same organizational entity. |
| S.No. | Author | Source | Year of Publication | Country | Definition |
|-------|--------|--------|---------------------|---------|------------|
| 8.    | Adler-Milstein et al (55) | Scientific | 2013 | US | Health information exchange (HIE) refers to the process of electronically transferring, or aggregating and enabling access to, patient health information and data across provider organizations. Exchange may take place between different types of entities, for example, e-transfer of patient data between ambulatory care providers or e-transfer of data at the regional level. |
| 9.    | AeHN (16) | Web page: Alaska eHealth Network | Unknown | US | Health information exchange (HIE) is the electronic sharing of health-related information. |
| 10.   | Afzal (71) | Conference: Maryland’s Health Information Exchange. SOA in Healthcare Conference. The Role of Health Information Exchange in Driving Toward Interoperability | 2011 | US | Health Information Exchange, or HIE, allows clinical information to move electronically among disparate health information systems. The goal of HIE is to deliver the right health information to the right place at the right time—providing safer, more timely, efficient, effective, equitable, patient-centered care. |
| 11.   | AHA (245) | Report: Health Information Exchange Projects What Hospitals and Health Systems Need to Know by American Health Association | Unknown | US | Health information exchange enables hospitals to bring better information to the point-of-care and enhances opportunities for clinical decision support. |
| 12.   | AHIMA (176) | Web Page: American Health Information Management Association | Unknown | US | An HIE is the electronic movement of health-related information among organizations according to nationally recognized standards. HIE is also sometimes referred to as a health information network (HIN). |
| 13.   | Alert (51) | Web page: Alert HIE, Provider | Portugal (Head Office) | | ALERT® HIE is an integration infrastructure that provides the ability to access patient clinical records from different healthcare facilities located in different geographical areas. |
| 14.   | Altman et al (99) | Scientific | 2012 | US | HIE enables digital, clinical information sharing among disparate institutions, which allows for a more seamless transition of care between providers. With HIE, patients can have their existing clinical information viewed by providers across different healthcare organisations, keeping all of their providers informed. Using HIE, community clinicians can also follow their patients' |

|-------|--------|--------|---------------------|---------|------------|
| 15.   | AMA    | Web page: American Medical Association | Unknown | US | Health Information Exchanges (HIEs) are entities that bring together health care stakeholders within a defined geographic area and govern the electronic sharing of health information among them for the purpose of improving health and care in that community. The fundamental concept behind creating HIEs is that the ability to exchange health information electronically is critical to the efforts to improve the US health care system. |
| 16.   | Amatayakul | Web page: Healthcare Financial Management business journal | 2008 | US | HIE organizations go by different names-local health information organizations (LHIO), regional health information organizations (RHIO), sub-network organizations (SNO)--they serve the same purpose: to oversee and govern the exchange of health-related information among disparate stakeholders for the purpose of improving health and health care. |
| 17.   | Ancker et al  | Scientific | 2012 | US | Health information exchange (HIE), the exchange of electronic patient data among healthcare providers and institutions, is being promoted by national policy because of its potential to improve healthcare quality and efficiency, engage consumers, and promote population health. |
| 18.   | Arkansas OHIT (SHARE) | Web page: Arkansas Office of Health Information Technology | Unknown | US | The Arkansas State Health Alliance for Records Exchange (SHARE) is a statewide health information exchange (HIE) that solves this problem. SHARE allows primary health care providers, related health services professionals, and public health authorities to access and exchange with each other real-time, electronic patient information that is secure and protected by current federal and state privacy and security laws. Through its implementation and use, SHARE will reduce medical errors and duplicate testing, promote improved management of chronic diseases, and improve patient care coordination among unaffiliated health care providers. |
| 19.   | Aspelin | Web page / Post: Mark Aspelin, Health IT Manager / Writer | Unknown | US | Health Information Exchange (HIE) is a term that is used to describe the sharing of health information electronically among two or more entities. The term is also used to describe an organization that provides services that enable the electronic sharing of health information. The concept of a health information exchange is a critical element of Meaningful Use, and the future of healthcare reform at the local, regional, and national level. |
| 20.   | Axolotl Corp. | Web page: Axolotol Corporation provider for browsing based-products | 2009 | US | NeHII is a statewide Health Information Exchange designed to share clinical and administrative data among providers in Nebraska and neighboring states. NeHII’s purpose is to achieve health care transformation through community betterment collaboration while protecting the security and privacy of medical information. |

| 29.  | Bugge et al (38) | Scientific | 2006               | UK      | Information exchange between patients and health professionals is fundamental to achieving patient participation in decision-making and shared decision-making is said to require the exchange of “all information relevant to decision-making”. |
| 30.  | Byers (15) | Scientific | 1957               | US      | The Occupational Health Information Exchange will serve as a central agency for the collection, collation, and dissemination of all types of information pertinent to occupational health problems. |
| 31.  | Cannoy (35) | PhD Thesis: The Implications of HIE on Healthcare Consumers: The Case of Consumer Empowerment, Business Education Department, North Carolina A&T State University | 2008 | US | The capability to use technology to electronically exchange medical records is called Healthcare Information Exchange (HIE). HIE is the process of utilizing information systems and technology for electronic storage, retrieval, and sharing of healthcare information among participants in the healthcare system so that information is accessible at the point of care. |
| 32.  | Care Accord (184) | Web page: Oregon HIE | Unknown | US | Health information exchange (HIE) allows doctors, nurses, pharmacists and other health care providers to securely share a patient’s medical information electronically — reducing the need for patients to transport or relay their medical history, lab results, images or prescriptions between health professionals. Instead, this information is shared between health care professionals before the patient arrives for an appointment or goes to the pharmacy. HIE can also reduce orders for duplicate procedures or tests because information is available where and when it is needed, as well as enabling smoother transitions of care because providers, hospitals and long term care facilities can more easily share information. |
| 33.  | Carter (286) | Scientific | 2006               | US      | There are a multitude of terms currently used to describe a networked community of healthcare entities using interoperable electronic health record systems to exchange health information. These include regional health information organization (RHIO), health information exchange (HIE), the nationwide health information network, and at one time, community health... |

|------|---------|--------|---------------------|---------|------------|
| 47.  | Daurio et al | Scientific | 2009 | US | A solution for Health Information Exchange (HIE) provides not only a solution to enable the many and diverse CSC applications for the eHealth agenda but also an agnostic design that will allow our partners and competitors to leverage this platform. The term HIE is also used to describe formal organizations that provide the infrastructure for electronic exchange. Health information exchanges or regional health information organizations (HIEs or RHIOs) have emerged as vehicles to facilitate the flow of clinical information between providers in the community; they are building on the foundation laid by the pioneers in the field, the Indiana Health Information Exchange, the Inland Northwest Health System, HealthBridge and a few others. The primary business focus of these networks has sought to create value for the provider community by creating productive efficiencies and therefore have achieved a modest but sustainable business model. Health Information Exchange (HIE) is a term used to describe the sharing of health information electronically among two or more entities. These entities are mostly organizations, which provide health services to their clients (the patients) and also enable the sharing of electronic health information. The exchange of medical data takes place primarily between different medical departments within the same health organization. This happens most of the time through an Electronic Health Records (EHR) system within the organization, but also across the organizational borders on the regional level (through Regional Health Information Systems, RHIS) or across the country (National EHR). An interoperable system of HIE—that is, one in which various parties can share and exchange data among them. HIEs would provide a unified view of a patient across health care providers and would serve as data collection points for clinical and resource utilization data. Collaborative relationships among primary care and specialty providers and their patients and families can be enhanced through electronic HIE. |

| 55.  | eHealth Initiative (280) | Report: Health Information Exchange: From Start Up to Sustainability by Foundation for eHealth Initiative | 2007               | US     | “Health information exchange” describes a commonly understood activity: the sharing of patient care data between non-aligned health care organizations for the purposes of enhancing quality and efficiency. |
| 56.  | eHealth Initiative (61) | 2011 Report on Health Information Exchange: The Changing Landscape    | 2011               | US     | The act of transferring health information electronically between two or more entities.                                                                                                                     |
| 57.  | eHealth Privacy 360 (67) | Web page: California Government                                       | 2011               | US     | The electronic exchange of health information allows your health care information to be shared between health care providers. This exchange is done through the EHR system. Your health information may be exchanged between doctors, laboratories, hospitals, pharmacies, and other providers you have visited. Health information from your health plan may also be exchanged and used for your care. |
| 58.  | Emdeon (235)   | Web page: Vendor / Solution Provider                                   | Unknown            | US     | Emdeon connects physicians, hospitals, pharmacies and labs to securely exchange information when it can save the most money and provide the most benefit - right at the point-of-care. Emdeon, currently performing more than 6.4 billion health information exchanges per year, makes the process of sharing information easy, efficient and affordable. |
| 59.  | Excelicare (41) | Web page: Axsys Health, Excelicare Solution Provider                  | Unknown            | UK     | Excelicare™ Clinical Portal allows users to explore information relevant to the care of every patient, regardless of where it was first recorded. As a caregiver, the portal offers you a composite view of patient information, in a clinically relevant format, with hyperlinks that let you drill to underlying details. Laboratory results and outstanding orders, recent medications and prescriptions, x-ray images and reports from radiology, coded problem list, clinical notes from any specialty – all these are presented in an easy-to-access, relevant way. But it doesn’t have to stop there. Referral and discharge letters, GP notes, appointments, assessments, clinical alters, and information from community health can be included. |

| 104   | HIMSS HIE Committee (17) | Report: HIE Implications in Meaningful Use Stage 1 Requirements, by HIMSS | 2010 | US | In its most conservative definition, HIE (the verb) is the activity of secure health data exchange between two authorized and consenting trading partners. Data exchange occurs between any two trading parties—a data supplier and a data receiver. It can also be facilitated by one, two or more third parties who operate between the data supplier and the data receiver. To add complexity, a third party could also be storing data from and on behalf of the data supplier and be transmitting data on behalf of the data supplier (in such case, the third party would be considered to be the data supplier). Further, a third party could be receiving data on behalf of a data receiver. While this may be complex, HIE activity can enhance virtually any clinical function by virtue of providing a broader set of data upon which clinical decisions can be based. |
| 105   | HINAz (236) | Web page: Health Information Network of Arizona | Unknown | US | A Health Information Exchange, such as HINAz, is a secure network that takes health care information from multiple health care organizations and sources and provides it to a patient's physician at the point of care when it is needed. |
| 106   | HINAz (179) | Web page: Health Information Network of Arizona | Unknown | US | A Health Information Exchange provides a network and universal format that connects hospitals, doctors and other providers. When needed, HIEs allow electronic health records, containing health-related information about a patient, to be securely shared among health care organizations. |
| 107   | Hincapie et al (103) | Scientific | 2011 | US | Health information exchange (HIE) is a potential solution to providing timely and effective clinical information at the point of care. |
| 108   | HIS (144) | Web page: Indian Health Service for American Indians and Alaska Natives | Unknown | US | The goal of a Health Information Exchange (HIE) is to drive towards efficient exchange of patient data, so that a unified and holistic view of patient data is obtained. This, in turn, will enable physicians to offer better care for patients because providers of care will have a complete picture including all available medical records. |

| 129. | Joshi (167) | Scientific | 2010 | US | Health Information Exchanges (HIE) are rapidly advancing as the next step in improving patient care using technological applications. HIE affect the fundamental patient care system by transforming how medical information is delivered and disseminated. |
| 130. | Johnson and Gadd (252) | Scientific | 2007 | US | Health information exchange (HIE) systems are large, multimillion dollar efforts that are implemented despite initial institutional apprehension, with largely unanticipated effects on the clinical workflow, and with a primary goal of establishing a reason to sustain the effort. |
| 131. | Jones et al (105) | Scientific | 2011 | US | Health information exchange (HIE), i.e., electronically exchanging key clinical information such as discharge summaries, procedures, problem lists, medication lists, medication allergies, and diagnostic test results with other external healthcare providers is a core requirement of Stage 1 “meaningful use” for hospitals. |
| 132. | Kaelber and Bate (259) | Scientific | 2007 | US | Better patient safety through enhanced, technology enabled, HIE will directly improve patient safety because it will provide a more complete clinical picture of a patient. |
| 133. | Karl (283) | Scientific | 2012 | US | The term "HIE," acronym for health information exchange, is being used interchangeably to define both the organization that is responsible for managing the exchange of the data (the noun) and the process by which the data can be exchanged (the verb). |
| 134. | KC (139) | Web page: Kane County Health Department | Unknown | US | The Health Information Exchange (HIE) will allow local public health departments to be able to evaluate real-time health data on a population level, in order to monitor the health of our community, as well as to assure that we provide the highest quality service to our residents. In addition, we will be better able to respond to health issues in our community. |
| 135. | Kern and Kaushal (64) | Scientific | 2007 | US | HIE involves the sharing of health information electronically across health care settings. |
| 136. | Kern et al (125) | Scientific | 2009 | US | Health information exchange involves the electronic sharing of clinical data, including sharing of clinical data across health care providers caring for the same patient. |
| 137. | Key Stone (204) | Web page: Key Stone HIE, Provider | Unknown | US | Keystone Health Information Exchange (KeyHIE) streamlines treatment decisions and care coordination with quick access to both in and out-of-network electronic health records (EHRs)-when and where you need them. |
| 138. | Kijsanayotin et al.(229) | Scientific | 2007 | US | In a health information exchange (HIE) project, linking patients' health records across organizations while maintaining appropriate patients anonymity is |

(52) | Scientific | 2011 | Finland / Sweden | The implementation of a technology such as health information exchange (HIE) through (regional health information systems) RHIS should improve the mobilization of health care information electronically across organizations within a region, by coordinating care and bringing together local stakeholders. |
| 154   | Maine (157) | Web page: Maine State HIE | Unknown | US | CMS defines HIE as the secure and interoperable sharing of health information in a manner that protects the confidentiality, privacy, and security of an individual's information. |
| 155   | marchcarson100 (282) | Blog: mandmhitech | 2011 | Unknown | HIE is a group of entities with the capability to move info digitally using nationwide standards. HIE is a Process. Health Info Exchange (HIE) refers back to the strategy of enabling the dependable sharing of digital patient care-associated data amongst health care associated entities and networks. This sharing is done in a way that protects the confidentiality, privacy and safety of the information. Central to this concept is the usage of nationally recognized standards currently in place and future ones as they are published. HIEs can even provide key information to people to promote improved health and wellness, and can be used to assist research, public well-being, emergency response, and high quality improvement. Additionally, an HIE allows the sharing of health-related data amongst healthcare organizations and with individuals on a neighborhood, regional, and nationwide basis. |
| 156   | Marchibroda (246) | Book: Health Literacy, eHealth, and Communication | 2009 | US | Health information exchange is another major component of eHealth. This refers to the electronic exchange of data across organizations and disparate information systems, including data from laboratories, pharmacies, plans, physicians, or hospitals. |

| 239   | Stoten (207)      | Scientific              | 2009                | US      | The Indiana Health Information Exchange (IHIE), known throughout the United States as being in the forefront of the Regional Health Information Organizations (RHIO) initiative, allows physicians to access information directly from their website or through a hospital portal. IHIE provides results such as dictation, lab, and radiology results and information is delivered to the physicians through direct connections with an EHR. |
| 240   | SuccessEHS (186)  | Web page: SuccessEHS Solution Provider | Unknown             | US      | HIE is both a verb and a noun. HIE as a noun: A health information exchange (HIE) refers to an exchange network or an organization that operates a network that connects the electronic health information systems of different health care providers. HIEs enable those providers to share clinical and demographic data of patients they have in common. For instance, a primary care physician may share a patient's data with that patient's cardiologist. HIE as a verb: Health information exchange is the actual transmission of health information. There are multiple types of HIE, including Direct, XDS, Exchange and custom HL7. |
| 241   | Suenaga (183)     | Web page: About the State HIE, Hawaii Health Information Exchange | 2012                | US      | The State Health Information Exchange is a secure electronic network that enables Hawaii health care providers – such as physicians, pharmacies, labs and other medical providers – to exchange select patient medical information. |
| 242   | Tang and Lee (261) | Scientific              | 2009                | US      | Health information exchange (HIE), a process that has been referred to as 'tethering' or 'interconnecting'                                           |
| 243   | Texas HIE (154)   | Web page: Texas HIE     | US                  |         | Electronic health information exchange, or HIE, is the secure electronic movement of health information among treating physicians and other healthcare providers and related organizations according to national and state laws and nationally recognized standards. |
| 244   | THHSC (93)        | Web page: Texas Health and Human Service Commission | Unknown             | US      | The creation of a statewide health information exchange will allow health information to be securely exchanged between providers within Texas. This will increase the coordination and quality of care while improving efficiency in the health care system and increasing consumer empowerment and control. |
| 245   | Thomas (76)       | Web page / Post: Open HIE Wiki | 2013                | Unknown | A Health Information Exchange (HIE) makes the sharing of health data across information systems possible. Like a universal translator, an HIE normalizes information to pass electronically across organizations within a particular region or community. Clear and strict state and federal guidelines govern how the information can be exchanged, viewed, and used. The goal of the HIE is to make the information available when and where it is needed. |
